The incidents which are embodied in Sir Walter Scott's story—the most powerful of all the tragedies the great novelist ever penned—really occurred near Wigtown, in the south-west of Scotland; but he at first declined to give the source from which he drew the materials of his tragic tale, because it might be displeasing to the feelings of the descendants of the parties concerned; and probably for the same reason he transferred the scene to the east coast—the counties of East Lothian and Berwick, in which the prototype of Caleb Balderstone flourished. No part of Scotland is richer in traditional, romantic, and historic incidents,

and Sir Walter has given additional interest to the district by associating it with the pathetic story of the last member of an old Scottish family. Going southward from Edinburgh, we enter upon it as soon as we cross the Esk, at Musselburgh, by an ancient, high, and narrow bridge, supposed to have been built by the Romans, which has been passed by all the sovereigns and ambassadors who for centuries either invaded or visited Scotland: by the Princess Margaret of England when she came to wed James IV.; by her hapless grand-daughter Mary when she visited Seton Castle, as she frequently did, to play at bowls and archery; by James VI. when he set out from his Scottish capital to take possession of the English throne; by his ill-starred son Charles I. when he made his visit to Scotland in 1633 to be crowned; and by his son James VII. when, as Duke of York, before he ascended the throne, he came to rule the country as the viceroy of his brother, Charles II. It was by this old bridge that the Scottish army passed to the battle of Pinkie, when a number of the soldiers and some persons of rank were killed by the cannon-shot from the English ships in the bay. The road leads up a steep brae from the river, and along the edge of the low fields where that disastrous battle was fought, and within sight of Carberry Hill, the scene of Queen Mary's surrender to the confederate nobles.

Proceeding onward, we pass the battlefield of Prestonpans, where the Highlanders in 1745 inflicted an ignominious defeat on the royal army under its incompetent commander, Sir John Cope. At its eastern extremity stood the magnificent mansion of the old and powerful family of the Setons, Earls of Winton, which was demolished towards the close of last century by an Edinburgh lawyer, who, under an illegal and, it was alleged, a fraudulent sale, which was ultimately set aside, obtained possession for some years of the castle and estate. The only object that remains truly worthy of the ancient magnificence of the place, associated with so many interesting events in Scottish history, is the beautiful collegiate church,

founded and richly endowed by the princely Setons. It has been recently cleared of the rubbish which long disfigured it, and put into a tolerable state of repair, to serve as a mausoleum for the Wemyss family.

A short distance to the south is Winton House, a picturesque mansion, which is regarded as the Ravenswood of the *Bride of Lammermoor*. It was erected in 1620 by George, tenth Lord, Seton and third Earl of Winton, who was a magnificent builder, on the site of an old house destroyed by the English in Lord Hertford's invasion. It is different from the usual Scottish baronial style of the seventeenth century, and is altogether, externally and internally, a most interesting baronial structure, and every way suitable for the residence of the great old family whose last representative is the hero of Scott's tale. In its splendid adjoining forest he lays the introduction of the Master of Ravenswood to Lucy Ashton, when by his skill as a marksman he rescues her from the fierce attack of one of the wild cattle that roamed its woods. The *Tod's Den* where Bucklaw and Craigenfelt waited his return is about three or four miles distant. The state apartment of the castle was the scene of the signing of the marriage contract between Bucklaw and Lucy Ashton, interrupted by the sudden entrance of Ravenswood, who had hastened thither on his return from the Continent, followed by the furious threats of the vindictive Colonel Ashton, the expostulations of the clergyman, the touching appeal of the affianced lover to his mistress, and her enforced relinquishment of the broken piece of gold, the counterpart of his, and the pledge of their engagement, which till that moment she had worn in her bosom. The marriage contract between Dunbar of Baldoon and Janet Dalrymple was found a few years ago among the papers of the Earl of Selkirk, who inherited Dunbar's estates. The signature of the unfortunate lady bears unmistakable indications of her agitation at the time when she subscribed the document. It is impossible that Sir Walter could have seen it; but he could not have given a more accurate description of the signatures if it had been lying before him.

In that same apartment, after the ill-fated marriage and the bridal banquet, when the dancing was about to begin, the discovery was made that the picture of Sir William Ashton's father had been removed from its place, and in its stead that of old Sir Malise Ravenswood seemed to frown wrath and vengeance upon the party assembled below, as if ready to utter the words, 'I bide my time,' according to tradition the signal for the deadly assault on the usurper of his castle and estate.

In Winton House is also laid the last scene of this terrible tragedy, when the bridegroom is found lying on the threshold of the bridal chamber covered with blood, and the bride is discovered in the corner of the great old-fashioned

chimney of the apartment, her nightclothes torn and dabbled with blood, her eyes glazed, and her features convulsed into a wild paroxysm of insanity. The fine old church of Pencaitland, within a few minutes' walk of Winton House, will serve as an appropriate representative of Ravenswood Church, the scene of the marriage and burial of the ill-fated bride.

Leaving this interesting mansion, recently the residence of the late venerable Lady Ruthven, a charming specimen of a Scottish lady of the old school, we pass in succession the seat of the celebrated patriot, Fletcher of Salton; Lethington (now called Lennoxlove), associated with the memory of Queen Mary's famous Secretary Maitland; and pass through the ancient royal burgh of Haddington, the birthplace of John Knox, with the remains of its splendid Franciscan church, the 'Lamp of Lothian,' burned by the English during Hertford's devastating invasion. Hailes Castle, the principal stronghold of the powerful family of Hepburn, is seen in ruins, on the banks of the Scottish Tyne. A short way below, on the left bank of that river, is Tynningham, the seat of the Earl of Haddington, with its famous trees and magnificent holly hedges, which far surpass in size and extent those of which Evelyn boasts so proudly in his *Sylva*. In its vicinity is Whitekirk, the scene of the labours of St Baldred, and a celebrated place of pilgrimage in the olden times. At a short distance to the north is North Berwick Law, and the massive remains of Tantallon Castle, a principal stronghold of the great old house of Douglas, standing on a projecting rock, round three sides of which the ocean flows. Opposite is the Bass Rock, rising over three hundred feet sheer out of the sea, an old possession of the Lauder family, a prison of the Covenanters, and the last spot in Scotland held for James VII. after the Revolution.

Pursuing our onward route, we pass the ancient burgh of Dunbar, with the scanty remains of its famous castle, which stood many a siege of the English invaders, notably one in which it was defended with brilliant courage and success by 'Black Agnes,' the Countess of Dunbar, and daughter of the gallant Regent Randolph, Earl of Moray. A short way beyond, the road crosses the Brocks-burn, near Broxmouth House, a seat of the Duke of Roxburgh, where Cromwell had his headquarters before the battle of Dunbar, and passes through the battle-field where General Leslie was defeated by him in September 1650.

A few miles beyond this memorable spot, the county of Berwick is entered at a deep ravine, spanned by one of the most splendid viaducts in the kingdom, on the one side of which is the old fortalice of Innerwick, and on the other the ruined stronghold of Dunglass, which was blown up by an English page who fired the powder-magazine when the castle was held by the Covenanters in 1640, out of revenge, it was said, for having been chastised by his master. The Earl of Haddington along with his brother and a number of the neighbouring gentlemen perished by the explosion.

The tract of country on which we now enter is high and flat, but is broken at little distances by numerous deep and narrow ravines, each of

which has at the bottom a slender stream running from the adjoining Lammermoor hills down to the sea. The most noted of these is the wooded ravine of Pease Dean, over which a bridge was thrown about a century ago, one hundred and twenty-seven feet in height, and regarded at the time of its erection as the highest bridge in the world. In former times an army, in order to cross this tremendous ravine, required to move singly, first down and then up the paths which traverse in zigzag fashion its steep and almost perpendicular sides. This was one of the passes which the Scottish army occupied when they hemmed in Oliver Cromwell at Dunbar, and which, in his despatch to the Parliament, he happily describes as a place 'where one man to hinder is better than twelve to make way.'

About five miles beyond Pease Bridge is the celebrated fortress of Fast Castle, the undoubted prototype of the 'Wolf's Crag' of the *Bride of Lammermoor*. The solitary and naked tower, of which only a few fragments now remain, stands on a precipitous rock on the seashore, nearly isolated, and connected with the mainland merely by a narrow isthmus only a few feet broad, and so entirely unsheltered and unprotected that it would be dangerous to attempt to cross it in a high wind. 'On three sides,' wrote Sir Walter, 'the rock was precipitous'; on the fourth, which was that towards the land, it had been originally fenced by an artificial ditch and drawbridge; but the latter was broken down and ruinous, and the former had been in part filled up, so as to allow passage for a horseman into the narrow courtyard, encircled on two sides with low offices and stables, partly ruinous, and enclosed on the landward front by a low embattled wall; while the remaining side of the quadrangle was occupied by the tower itself, which, tall and narrow, and built of a grayish stone, stood glimmering in the moonlight like the sheeted spectre of some huge giant. The mainland at this point overhangs the castle walls, and is at least a hundred and fifty feet above the level of their site, so that after artillery came into operation it was virtually defenceless.

Though this wild and desolate spot is now visited chiefly—indeed, we may say exclusively—in consequence of its having been immortalised by the pen of the great novelist, Fast Castle in ancient times was a place of celebrity, and was connected with one of the most mysterious incidents in Scottish history. The Princess Margaret of England, after her marriage by proxy to James IV. at Lammermoor, lodged at Fast Castle a night on her way to join her royal husband at Edinburgh. The castle was an ancient possession of the great Border family of Home. Patrick Home of Fast Castle was one of the negotiators of the truce between Henry VII. and James IV.; and Cuthbert Home of Fast Castle fought at Flodden under the standard of his chief, Lord Home. Fast Castle was repeatedly taken and retaken by the English. In 1570, when garrisoned by only ten men, Sir William Drury, governor of Berwick, sent two hundred men to attack it. After it surrendered to this force, a party of only fourteen English soldiers was left in it 'as a sufficient force to keep it against all Scotland, the situation being so strong.'

From the Homes, Fast Castle and the adjoining

lands passed to Robert Logan of Restalrig, by his marriage to the eldest daughter of Sir Patrick Home, who fell fighting under the banner of the Regent Moray at the battle of Langside. It was from its connection with Logan, who was a daring and unscrupulous villain, that Fast Castle has derived its chief historical celebrity and interest. A meeting was arranged to be held within its walls, and probably was held, between Logan and Napier of Merchiston, the celebrated inventor of logarithms. Logan believed that his castle contained a vast amount of hidden treasure, for which Napier undertook to make search by divination—'the black art.' It was stipulated in the bond signed by these two strange and incongruous confederates, and which is still extant, that Napier was to be recompensed with an exact third of whatever treasure was found, besides payment of his expenses, whatever might be the result of his search, and a safe-conduct back to Edinburgh. It is not known whether the philosopher actually journeyed to the spray-beaten tower of Fast Castle, and did there practise his 'craft and ingyne;' but he appears to have very soon discovered the true character of his Berwickshire host, for we find him two years after inserting in a lease of a part of his estate an express stipulation that the tenant should not sublet any portion of the land to any person of the name of Logan.

In Logan's hands Fast Castle appears to have become a den of highway robbers. In June 1592-3, he was denounced to the Privy-council for sending out two of his servants to rob travellers on the highway near his house. They had attacked Robert Gray, burgess of Edinburgh, and taken from him nine hundred and fifty pounds, besides 'battering him to the peril of his life.'

But the most important and celebrated incident which occurred in the history of this ancient stronghold was the use to which, in all probability, it was to be put if the Gowrie conspiracy had been successful. There is good reason to believe that it was the intention of the conspirators to convey King James from the Earl of Gowrie's house at Perth down the Tay, and thence by sea to Fast Castle. Once there, it was no doubt thought that the impregnable strength of the fortress would secure the conspirators against a rescue; while the proximity to the English Border would enable them to make the most of their royal captive in any negotiation with his jealous and unscrupulous rival, Queen Elizabeth. Logan's co-operation was purchased by a promise of the lands of Dirleton, which he designated 'the pleasantest dwelling in Scotland.' His complicity in this mysterious conspiracy was not suspected; and it was not until six years afterwards, when he had been two years in his grave, that it was brought to light by the discovery of the letters which had passed between him and the Gowrie brothers. His bones were exhumed, in order that the sentence of forfeiture might be legally pronounced over them; and Fast Castle and Restalrig, Logan's estate near Edinburgh, were bestowed on some of James's greedy favourites.

The historical celebrity of Fast Castle may have had something to do with its selection by Scott as the prototype of Wolf's Crag; but in all probability the great novelist was induced by its

solitary and forlorn condition to picture it as the appropriate residence of the last member of a great old ruined family. 'A wilder or more disconsolate dwelling,' he says, 'it was perhaps difficult to conceive. The sombre and heavy sound of the billows, successively dashing against the rocky beach at a profound distance beneath, was to the ear what the landscape was to the eye—a symbol of unvaried and monotonous melancholy, not unmingled with horror.' The feeling of desolation which the scene still inspires is not lessened, now that the ruins of the lonely sea-beaten tower are tenanted only by the seaweed and the cormorant. It will be recollected by the readers of the tale that the novelist describes the Master of Ravenswood as having been engulfed in the quicksands, called the Kelpie's Flow, which lay between the tower and the sand-knolls where Colonel Ashton was impatiently waiting to encounter him in a duel. It has transpired that this was suggested to Scott by a story respecting the first Lord Belhaven, who contrived to conceal his existence for six years by causing it to be given out that 'on ryding across the Solway sands both he and his horse gubairon he raid were sunkin in these quickwands and drowned.' It was owing to Mr Charles Kirkpatrick Sharpe having on one occasion related this singular story to Sir Walter Scott, that the idea first occurred to him that he should terminate the existence of the Master of Ravenswood by a death similar to that which was feigned by Lord Belhaven, and which Sir Walter has made so deeply affecting as the final fate of his hero.

The other places connected with the story have been, of course, identified with corresponding places existing in the district. The churchyard of Houndwood is supposed to be the old solitary burial-ground of Hermitage, with its one or two shattered yew-trees, 'situated in the nook formed by the eddying sweep of a stream which issued from the adjoining hills. A rude cavern in an adjacent rock, which in the interior was cut into the shape of a cross, formed the hermitage, where some Saxon saint had in ancient times done penance, and given name to the place. The rich abbey of Coldingham had in later days established a chapel in the neighbourhood, of which no vestige was now visible. In the churchyard which surrounded it, warriors and barons had been buried of old, but their names were forgotten and their monuments demolished.' In this solitary spot, old blind Alice, the faithful retainer of the Ravenswood family, was laid. The fishing village of Eyemouth may represent Wolf's Hope, the scene of Caleb Balderstone's raiding exploits, and of the entertainment which John Girder the cooper gave to the Marquis of A—. In former days, it was noted for its contraband trade, as Sir Walter makes John Girder's mother-in-law admit, in which all the people, high and low, young and old, rich and poor, were more or less engaged. It was said of it fifty years ago that it had still a dark and cunning look, was full of curious blind alleys, and had as much of its buildings under as above ground.

Such are the places supposed to have been in Scott's mind when he laid out the scenes of his novel. Geographically, they lie too far apart to have formed the scene of any such story as Scott writes; but under other names, and grouped

anew by the all-fashioning eye of genius, they form the imaginary locality in which the novelist's men and women worked out the tragedy of their lives.

JOHN VALE'S GUARDIAN.

CHAPTER XXII.

THIS made things worse for the moment; but by-and-by it made them better. She was certainly doing no wrong, and Mr Snelling had not yet the right to express in so pronounced a fashion his disapproval of anything she might do.

'I should know it was you, Cecilia,' said John, indicating the pink figure in the sketch.

'I don't know how,' answered Cecilia; 'you can't see the face.'

'No,' said the boy; 'but you turn your head in that way.'

'Very—pretty—attitude,' said Jousserau in his halting English; and stooping over the canvas, he laid a careful touch upon the figure with his brush.

Cecilia blushed; but now that she came to think of it, it really was rather a taking attitude. She had not the advantage of reflecting mirrors at her toilet, and except for what the looking-glass showed her frankly when she fronted it, could form no idea of her own personal aspect. In a general way, she approved of it, and she had her curiosities, like the rest of her sex. It had even occurred to her—as if it had been an idea entirely of her own invention—that it would be agreeable to be aware of one's personal appearance all round. The report of the most tasteful and trustworthy companion with respect to the condition of one's back hair, for instance, was less satisfactory than one actual ocular demonstration might be. This being sketched was one way of realising the vision, and so far it was eminently satisfactory. There were a grace and charm about the pictured figure which she had not had vanity enough to claim.

Jousserau was the better satisfied with the figure because it was his own handiwork; and Cecilia was far more interested in it than she would have been if any one else had sat as model.

'Charming!' said the artist, laying another touch upon it. 'Very. Yes. Oh, very.'

He was obviously a discerning young man, and the girl was impelled to steal a look at him. His frankness of compliment was new to her experience; but she liked it none the less because of its novelty. He was so very easy with it, and seemed to express his admiration so naturally, that it was scarcely embarrassing at all.

'This,' said Jousserau, indicating the picture with his brush, 'is not my force.' He turned and spoke in his own language: 'John, what is the English for *paysage*?'—John shook his head to express his ignorance, and the artist was compelled to get on without his help.—'I do not do at my best when I do this. Trees—I am no good. Fields, hills—no good. I paint the face, the robe, the hands. Oh, with a great difference!'

'Indeed?' said Cecilia, not well knowing what else to say.

'At this,' continued Jousserau, indicating the landscape, 'I practise, and shall be better. Oh, yes. In time. Without a doubt. But I am not yet strong.'

'I think it is very beautiful,' Cecilia answered honestly. 'It was not only beautiful, but quite wonderful in her eyes.'

Jousserau snatched the sketch delicately from the easel, poising it between both palms, and held it out to her. 'If mees approves,' he said. 'It is nothing. But—if mees would like it.'

'Oh no; I couldn't,' she cried, shrinking back. 'I couldn't even think of such a thing.'

'Why not?' he asked. 'Pray. Yes. It is nothing. It is bad, oh, very bad, but that makes so easy to accept it, and so hard to say no.'

'No; thank you,' she answered. 'I couldn't rob you of it.'

'Ah!' he said, artfully feigning deep humiliation. 'It is too bad to take. It is not worth your while. I beg your pardon. Shall I srow it a-vay?'

'Please, don't do that, sir,' said Cecilia; 'but I cannot take it. It is very beautiful, but I must not take it.' The young man had begun to be nearly embarrassing, and there was evidently but one way to be taken with him. She fell back upon rustic candour and dignity. 'I have been told you have different manners in your country, and I daresay they are nice for those who know them. But in England girls do not take presents from young men.'

'Presents?' queried Jousserau. 'Oh, yes. Gifts. Can you call this a gift? It is nothing.'

'Thank you very much indeed,' said Cecilia, so decidedly that he returned the sketch to the easel and forbore to press her further.

'I am—what you call it?—rude,' he said. 'It is not good any more in my country than here. I do not mean harm, but I am savage.'

He looked so very humble and contrite, that she smiled at him; and straightway his swarthy handsome face beamed in answer, and he made a new movement towards the easel. She shook her head seriously, and he paused midway, again as suddenly contrite as a child.

'Not to show,' he asked, picking his way carefully over the treacherous boulders of the foreign language, 'that I am pardon.'

'You are very kind,' she said; 'but English people always say what they mean. We never say No and mean Yes, or say Yes and mean No.'

'True?' asked the little man, smiling once more. 'You are wonderful people. With us, we do often so; and the young meesses—oh, always!'

'So they do here, Mr Jousserau,' said Master Will.

'Not if they respect themselves,' answered Cecilia dryly. Then, with great sweetness: 'I have overstayed my time; I must wish you good-morning, sir.—Thank you for having let me see you paint.'

'It is I who must say sank you,' said Jousserau, raising his hat and bowing. 'I hope I have not frighten you with my savage ways?'

'Not at all,' the girl answered, half laughing.

She had not heard the hurried returning hoof-beats, and no one else seemed to have noticed them; but just at this moment Snelling's voice

was heard calling from the road: 'Miss Shorthouse, a word with you, if you please.'

'If you please, Mr Snelling,' Cecilia answered, turning and moving towards him.

Snelling rode to the open gate, and there dismounting, led his horse by the reins into the meadow. His brow was black with anger, and his clean-shaven lips were tight-set in the effort to repress it. 'Considerin', Miss Shorthouse,' he began, and then stammered and halted.

'Considerin'.' She prompted him rather coolly; but then his face and manner hardly indicated friendship, and she felt anew that he had no right to look at her as he did.

'Considerin' the question that stands as yet unanswered betwixt you and me, do you think it a fair thing to stand here listening whilst my character is took away by a law-breaking vagabond as I could ha' sent to prison a fortnight back, if I had had the mind to do it?'

'I don't know what you mean,' she answered. 'Your name has not been mentioned.'

'My name has not been mentioned?' he repeated in angry astonishment.

'Nobody has spoken about you, Mr Snelling,' she answered; 'or,' she added with the true Midland directness, 'thought about you either, so far as I know.'

'That's as maybe,' he said surlily. 'At any-rate, that fellow's no fit company for a young woman as may one day be my wife.'

'It's early days to talk like that, Mr Snelling,' returned Cecilia. 'I am obliged to you all the same.'

'Obliged?' said Snelling surlily. 'As how, if you please?'

'You let me see what I had to look forward to, Mr Snelling.—I wish you good-morning.'

The courtier had not bargained for this; and he began to see that he had gone too far. Cecilia was young enough to be his daughter, and in his own thoughts he had always taken an authoritative air with her. In his own thoughts he took authoritative airs with everybody, and it seemed to him that nature had given him rights that way. Even if he had been her lover as well as her suitor, her quiet disdain of his interference could hardly have pricked him deeper; but it was necessary to take another tone.

'Miss Shorthouse,' he said, 'you may not know it, but I have better excuses than you think for. If there is another man in the world who has been as sorely tried as me this two weeks past, I know how to be sorry for him. I have had lies upon lies heaped on me by the whole neighbourhood, and the man that stands there'—pointing towards Jousserau with his whip—'is answerable for a round half of 'em. So far as I can find, he has talked to nobody in this parish or its neighbourhood sence first he came here without striving to take away my character. I put that as my excuse for speaking to you as I did.'

'He has said nothing to me,' Cecilia answered. 'Your name has not been named between us.'

Now, so far Snelling had made his *amende*, and the girl, who was of a placable nature, had frankly excused him. Her father was the suitor's partisan, and she had naturally imbibed his opinions. If she had entertained so much as a doubt of them, the question of Mr Snelling's proposal would have been settled in a moment.

But Snelling could not let well alone. 'I shall ask you, Miss Shorthouse,' he said, 'to permit me to see you home.'

'Do you think that needful, Mr. Snelling?' the girl asked him, with a little flash of mischief in her eyes.

'I conceive it,' said Snelling clumsily, 'to be my duty to take you out of the way of undesirable acquaintances.'

'Not yet,' said Cecilia; and in the heat of the moment she did what she would not have done on reflection—she walked towards the trio of onlookers and shook hands with them all round.

'Good-morning, sir,' she said to Jousserau. 'Thank you once more.—Good-morning, William.—Good-morning, John.—You must come and see me when you can find time, both of you.' Then, with a demure little courtesy to the foreigner, she left the meadow without so much as a look or a word for Snelling. He, beating his corduroyed leg with his whip, and timing the blows with an emphatic motion of his foot upon the grass, looked after them until she had passed the gate, and then turned his face upon Jousserau. It would have been an exquisite consolation to have been able to flog his traducer, who not only spoke the truth about him, but was a foreigner into the bargain, and therefore doubly hateful and despicable. The fingers of his left hand seemed to itch for a grip on the little man's collar; but even in the rage of his anger and discomfiture, he had self-control enough to see how little a brawl would help him, and how little excuse the moment offered. He turned abruptly away and marched to the road, the bridle hanging loosely from his arm, and his horse tractably following him. He caught a glimpse of Cecilia as she passed the first bend of the lane; and throwing himself into the saddle, he jogged after her, repressing with difficulty the temptation to provoke a quarrel with his steed.

He was not accustomed to lose his self-control, but from the hour of Tobias Orme's visit with news of the boys, nothing had gone satisfactorily with him. He had discharged Isaiah, and found a hundred little tangled strings in business which without his confidential factotum's aid he had no power to unravel. Isaiah had of course taken his wife with him; and Mrs Winter had been so excellent a housekeeper that he found it difficult to replace her. The woman he had hired in her stead knew nothing of his habits, and he felt himself doomed to months of discomfort before she could learn them. The neighbours were formed into clans about him, some believing in the villainy charged against him, and others deriding the story. However warm his friends were, he met cool greetings enough to anger him a score of times a day. And worst of all, that pernicious young John was back again under conditions which made it imperatively necessary that he should be treated with at least apparent kindness. He hated him so that all the gall in his system—and there was much of it—seemed to flood his own heart whenever he looked at him; and yet he had to speak him fair and treat him softly, as if he loved him. It had been his one vile purpose to cow the boy into incurable dullness, and now his fear was lost he should frighten him into a mere momentary sign of it. Life was like a bed of thorns to him, and wherever he looked he saw or suspected an enemy.

Cecilia looked round as he approached her, and being already a little repentant in her own mind, stood still until he gained her side, when she walked slowly on again.

'I'm sorry, Miss Shorthouse,' he said, bending down from the saddle, 'to find you so mistook my meaning. I meant no impidence. It's clear you took offence, and I daresay you had a right to; but I give you my word as none was meant.'

'I was quite sure of that, Mr Snelling,' she answered; 'and I shall be thankful if you'll say no more about it.'

He sat upright and breathed a great sigh of relief. She heard it, and stole a look at him. Perhaps he cared for her. She did not know. Men had strange ways. She was a little sorry for him and the troubles he had spoken of, and was not well pleased with her own conduct of the morning. She thought she had been forward and unmaidenly. It was presumptuous of the stranger to have set her in his picture. It had been foolish and forward on her part to allow him to do so. She was in a compound mood, such as only women know by actual experience. In plain English, she had shot her bolt, had brought down her quarry, and, woman-like, regretted victory. None the less, she had had a sight of Snelling in a new character, and had made up her mind about him finally.

'It seems, Miss Shorthouse,' said he, 'that I made a mistake in riding back again; and now, with your good leave, I'll turn round again, though I'm loth to quit you.' This was the nearest approach to a love-like speech he had ever made to her, and he felt awkward and stupid when she returned no answer to it. 'I expect,' he added, speaking simply to relieve himself of this embarrassment, 'I may light upon your father in town.'

'He has gone to market,' said Cecilia.

Snelling turned his horse half round in the lane and looked down at her indifferently.

'He put my question afore you a fortnight ago, Miss Shorthouse?'

'Yes, Mr Snelling.'

'And when may I look to get your answer?'

'I have promised my father for to-night,' she responded, looking away from him, her face hidden by the sun-bonnet.

'I hope,' he said, 'as what has happened this morning'll make no difference?'

'I think not,' she answered, with her face still hidden. 'No; it will make no difference.'

On that they parted; and Snelling put his horse to his best speed to make up for lost time. Miss Shorthouse's acres shone just then as the one bright spot on his horizon. He felt that he had behaved with great want of tact, but congratulated himself on having smoothed away the effects of wrath and suspicion by apology. After all, he acknowledged, the girl had only behaved with proper spirit. She was free as yet, and he thought none the worse of her for refusing to obey the bridle before her time came. As Mrs Snelling, she would learn to yield him a natural and befitting obedience. So long as she was Miss Shorthouse, she had a right to set a value upon herself. He thought himself somewhat magnanimous in looking at things in this way, and rode on in fair hope.

He met Shorthouse at the market, as he had

anticipated, and the two dined together at an ordinary frequented by the better class of farmers, Snelling insisting on paying for the dinner, and ordering up after it a bottle of curious old port, with which they accompanied the after-dinner pipe in true barbaric fashion.

Over the cheering vintage, Farmer Shorthouse grew first passably confident, and then cock-sure, and over the final glass clapped Snelling on the shoulder. 'It's all right, my boy,' he said. 'It'll be "Yes" to-night for a fiver.'

'Let's hope so,' said Snelling; but though he took it very calmly and gravely, the father's opinion fortified his own.—'We'll see,' he added comfortably, not wishing to appear too anxious—'we'll see how it turns out. I'll ride over, if you like, towards nine in the evening.'

Having arrived at that understanding, they parted in pursuit of their separate affairs; and in due time Shorthouse, having finished his business, rode home. The bovine unsentimental man was always a little more disposed to be kindly on a market night than on ordinary evenings, because, with his weekly journey to the town, he allowed himself a something extra in the way of dinner, and comforted his heart with a glass of grog amongst his friends before starting homewards. He was a sober creature enough for the rest of the week; but on market nights he reckoned to warm himself like his neighbours; and neither he nor they—good easy folk—thought any harm of it. He jogged on, a little muzzy in his thoughts,—foolish and kind—thinking what a good fellow Snelling was, and what a nice girl was Cecilia, and how he himself would do his heart good at the wedding, and shine at Sir Roger de Coverley after it; and so in the golden evening sunshine reached his own gate, and, surrendering his horse, dismounted.

Cecilia was out of the way somewhere; but a substantial tea was laid, and a substantial serving-girl was there to see to her master's comforts. She tendered the boot-jack and his shippers; and the good man having made himself comfortable, sat down by the round of cold boiled beef and the teapot and made himself more comfortable yet. His meal over, he lit his pipe and strolled out into the garden, and there amongst the early roses was Cecilia. She nodded to his greeting, but did not seem very anxious to meet him.

'Come here, wench,' said the farmer; and she obeying lingeringly, he put an arm about her waist and gave her a vinously affectionate kiss. 'Hast made up thy mind yet?'

'Yes, father.'

'Well, what is it? Yes or No? No or Yes? Which is it? I'm game for a dance at the weddin'. And he began to foot it heel and toe, humming an old-fashioned dance tune, and keeping time with the stem of his long Broseley.

Cecilia was looking away to the rosy afterglow of the sunset over the hills, and the farmer's face was turned in the same direction.

'I hope you won't be disappointed, father.'

'Eh? It's a match, ain't it?'

'No, father. I've been thinking about it all day, and I can't marry Mr Snelling.'

'Rubbidge, my wench! Clear rubbidge!' cried Shorthouse.

'No, father, dear; I can't marry him.'

There was the noise of a crunching step upon

the gravel, and they both turned. Snelling had approached them unheard, walking for the most part on a moss-grown path. His face looked gray, and his eyes were full of a gloomy anger. 'Well and good,' was all he said. 'I've heard my answer, and I've got nothing to wait for.' He turned upon his heel and walked into the gathering shadows.

The two—father and daughter—watched him blankly as he moved away, and the shadows seemed to drape him round at first and then to hide him. But deeper and denser than the outward shadow rose the inward. He shook his fist towards his own house when once the hedge had altogether hidden him. 'I owe thee this wi' the rest, nevev John,' he said; 'and I'll pay thee for it.'

(To be continued.)

THE AMERICAN BOARDING-HOUSE.

THE boarding-house of the United States is an institution peculiar to that country. It flourishes with more or less prosperity in every city, town, and mining camp from the State of Maine to California. Its destinies are invariably presided over by a female, usually a widow, who, when left to fight the battle with the world alone, and being possessed of the enterprise peculiar to the Yankee, sees in that avocation the best field to harvest a competency for her declining years. There is no doubt that many of them, when they first put out their signs, 'Gentlemen Boarders wanted,' or 'Furnished Rooms for Gentlemen only, with table-board if desired,' or 'Board and Furnished Rooms,' have an eye to the main chance, and place reliance in the saying that 'there are as good fish in the sea as ever were caught.' But unless they are successful anglers in the early days of their career as landladies, it is seldom they fall victims to the 'grand passion' after they have graduated, as it were, in their chosen career. The reason for this is undoubtedly twofold. In the first place, they are bound to grow suspicious of men, because of the many dead-beats they encounter, and this causes them to become to a certain extent man-haters. In the second place, he indeed is a brave man who is anxious to link his fortunes with his landlady.

Boarding-houses are of all grades, from the elegantly appointed mansion, furnished with every care for comfort and luxury, where the successful business-man is offered an asylum with all home comforts for himself and family at an exorbitantly high price, to the board shanty in the mining camp, in which carpets are dispensed with, and all the furniture has been manufactured by the nearest carpenter. They differ from an hotel in many respects, but the principal feature is that of so-called 'home comforts,' which it is the delight of the landlady to parade before her guests, or boarders as they are called. 'Home comforts' is a great hobby with the thoroughbred landlady, and she never fails to call attention to the fact

that in an hotel you are compelled to live alone, as it were, amid strangers, while in her house you find pleasant society in the parlours, coupled with the assurance that she will impose on herself all the duties of a mother if you are ill. Of course, in some instances you do find these 'home comforts' to be actual, and not mythical; but as a rule the latter is the case. The idea of the average landlady acting in the capacity of a mother to the young ladies and gentlemen who are usually the occupants of city boarding-houses is a huge joke with the veteran boarder; while it is contemplated with a mixed feeling of joy and awe by the youth or maiden fresh from a real home, who has come to the city either to finish education or to engage in some of the many occupations offered there.

There is no doubt that the landladies do have their tempers very heavily taxed, and have trials to endure such as are not calculated to develop their motherly feelings towards their boarders; and she is a woman in a thousand who can keep boarding-house and also retain a genial sunny disposition. She is looked upon by many of the fast youths of the cities, as well as the no less fast men of the mining camps, as the natural prey of mankind generally. She is the first creditor who gets 'stood off' on pay-day; for many seem to think, as I once heard a man express himself when dunned for a long-standing board bill. 'Money!' said he. 'Well, that's a good joke. Why, I can board at an hotel by paying for it. If you, old lady, can't run your house without money, you had better sell out to some one who can.'

Many a time have I known men take the money they ought to give to their boarding-mistress, and with it tempt the fickle goddess in the gambling dens, with the usual result—returning home with empty pockets, and of course standing the landlady off till next pay-day. One who has observed the workings of this system must sympathise to a great extent with the victim who is compelled to feed and shelter such men to obtain a livelihood. If a woman would be successful in this business, she must be shrewd, a good judge of nature and character, and a good financier. It is the development of this latter characteristic which is to a great extent responsible for many of the funny paragraphs published about the boarding-houses and landladies. Remove them from the land, and I fear many a humorist would be at a loss for a target at which to hurl his jokes. The slang dictionary also would be despoiled of many words and phrases, such as 'boarding-house hash,' a term which in this country is applied to all the edibles served up, and not, as is often supposed, to any one particular dish, although there is one dish to which it may be more properly applied, that being a mysterious composition of finely chopped or minced meat highly flavoured with onions. It is very palatable, if a person can control his

thoughts while eating, and not let them wander to the kitchen, where in his mind's eye he sees the thrifty landlady chopping up the leavings of the boarders from many past meals. Then we have the term 'biscuit-shooter,' which, being translated, refers to the young woman who acts as waiter during meal-hours; and another, 'hash-house,' referring to the boarding-house itself; and many others of a like nature.

While the good financing of the landladies may be a fruitful subject for the humorist to joke on, it is, figuratively speaking, death to the boarders. Too often all the butter needs is legs, and it would walk off the table, for it is possessed of strength sufficient. The steak is generally the horror of persons with false teeth; while the hot buckwheat cakes are often more fitted for ammunition for a Gatling gun. But the event of the week is the Sunday dinner; that is looked forward to with a relish, especially by people of a sanguine temperament, because they always are able to hope that the one coming will prove better than the last. Then it is that the poultry is served; then the fowl which has outlived its usefulness as a source of profit to the farmer appears on the boarding-house table to tempt the appetites of the boarders, but not to satisfy them, for he must indeed be possessed of good teeth and digestive organs who can make out a meal. I always find myself speculating on the number of broods of chickens that particular fowl has raised, off which I am called on to make my Sunday dinner. And as if to add insult to injury, you are always invited to partake of 'chicken.' No matter how old and tough, it is always called chicken.

The inmates of the boarding-houses are, to a student of human nature, rare studies. There is the old gentleman who delights in discussing politics at the table, and is in his element whenever he can find some one to argue with. He regularly reads the daily papers, and insists on helping the digestive organs of his fellow-boarders by imparting his knowledge to them. He is ably seconded by the spinster who has fanatical views on the temperance question, which she delights in repeating day after day and meal after meal. I often think that this is another evidence of the good financing qualities of the landlady, who believes that when people are talking neither they nor their listeners will eat as much, and that with this end in view she hires these 'cranks' to talk as much as possible. Then there is the young man whose ambition it is to have people believe he is on the Board of Trade or Stock Board, his conversation being invariably on the subject of bulls and bears, puts and calls, short and long. The real estate agent, and life-insurance agent, too, find their way to the boarding-house table, and regale their fellow-boarders by talking 'shop' all through meal-times. The younger ladies, if the boarding-house happens to have any such within its precincts, discuss sealskin saques, their last new dress, Mrs So-and-so's last new bonnet, &c.; while the married couples delight in telling of the time they 'kept house'; and the landlady, if she happen to be at the table, is not backward with her laments that butter has raised or flour gone up. Then the widow, if any such there happen to be, insists on recounting to the assembled company the many virtues possessed by the

dear departed. But life in a boarding-house must be experienced to be fully appreciated. It is most thoroughly American; no other nationality would ever endure it.

OGILVIE WHITTLECHURCH.

CHAPTER V.

BEFORE Rimington had gone many yards in the direction of the cliff the moon became obscured; but he was able to make pretty straight for where he had seen the man lie down. In a few minutes he espied him, lying like a log, a few paces on his right. He advanced, and was just stooping down to shake him to his senses, when the seeming inebriate jumped up, and, springing at him with all his force, endeavoured to throw him over the cliff.

On occasions like this, ideas rush through the brain with lightning-like rapidity, time, indeed, being almost a negligible quantity. But, though the thinking powers are at a maximum, the capacity for putting the thoughts into practice and profiting by the conclusions arrived at, becomes almost nil. The brain, so to speak, divides from the nerves, which, since they can no longer keep pace with it, it leaves behind, and rushing on through, it may be, an analysis of the circumstances, it may be a retrospect of previous events, leaves to the inferior organs, backed up by a sort of instinct, the practical task of saving the whole. Sooner or later, however, the normal condition of affairs is resumed, and all the faculties, mental and physical, act once more in unison. The time it takes for this to happen varies with the individual. It seldom exceeds a second or two, and its length may be said to be more or less a gauge of his practical character and fitness for responsibility. In plain English, it is nothing more or less than the time he takes to regain his presence of mind.

With Rimington, accustomed and trained to act promptly in emergencies, that time was almost inappreciable; but short as it was, it had sufficed for him to recognise Miller, able seaman in the *Maharanee*, to speculate on his motives, and come to the conclusion that he must either be the victim of a drunkard's frenzy or of mistaken identity. Soon, however, these speculations ceased, and all his energies were enlisted in the desperate struggle, on which, it seemed, depended his very life. Both men were strong, and at first the contest was fairly equal. Rimington, however, was encumbered by his thick greatcoat, and this told on him more every second. He felt that he was being slowly but surely forced nearer the edge of the cliff. So far, the struggle had been carried on in silence; now he shouted for help. With an oath, his opponent tried to put his hand over his mouth, and, in so doing, partially threw back his hood. Just before, he had been gathering himself together for a final throw; but when he saw Rimington's features, he suddenly started back, paused a second, and then saying, 'Great God! it's Mr Rimington,' made off at the top of his speed.

'Hi! Stop him! Help!' cried Rimington, giving chase, for he had no mind to let him off so easily.

'Hullo! What is it?' cried a voice from the direction of Rose Cottage.

It was that of a young man, who, seeing how things were, ran to cut off the fugitive. He judged his direction well, and at first it looked as if, between the two, Miller would be secured. The latter, however, had a good start of the stranger, and was greatly assisted by the darkness of the night. He was also a good runner, so that, although the chances seemed against him at first, he managed to give both his pursuers the slip.

The latter now turned to speak to each other. 'Hullo! Rimington,' cried Forward; 'I'm awfully glad to see you back.—But what on earth has been happening?'

'That's more than I can tell you,' replied the other. 'At least, if I can tell you what has been happening, I certainly can't imagine why it has happened. I walked home from the station; and just as I got to the door, I saw a man—tipsy, as I thought—close to the edge of the cliff. I went to see what I could do for him; but I soon found that the obligation was more likely to be on the other side—he very nearly did for me.'

'How?'

'Simply enough. He tried to throw me over the cliff. Indeed, I thought he would have done it, too; but luckily for me, just as I thought that it was all up, my hood got shoved aside, and he recognised me, started back as if he had been shot, and ran away. So here I am, all over mud, and very glad that it's no worse.'

'You say that he recognised you. Do you know the man, then?'

'Yes; I do, and that is the strangest part of it all. He was a seaman in the *Maharanee*, a man called Miller.'

'Charles Miller?'

'Ye. Why, do you know him?'

'I do know something of him, and what made me ask was that I thought I recognised him as he was running across the common.—What are you going to do now?—Inform the police?'

'Well, I really scarcely know. It all seems so incomprehensible. He evidently did not wish to murder me—that is, when he saw who I was—because he could not have had a better chance. I can hardly believe that the man goes in for highway robbery. He certainly never tried to take my watch. But I suppose that the best plan will be to inform the police, as you suggest.'

'Approved,' replied Forward, 'with one amendment. I am going home, and the police station is on my way, so I'll look out for that. You go straight home.'

'It's very good of you.—Thanks, very much.'

'Not the least trouble in the world,' said Forward; 'good-night. There is something I want to tell you; but this business ought to be done as soon as possible; and I think that Mr Rimington will tell you all about it to-morrow morning; so I won't stay.—Good-night again.'

'Good-night.'

The next morning, when he came down, Rimington found his mother awaiting him, but not Mary. 'Why, mother,' he said, 'where's that sister of mine? I thought that she was an early bird.'

'Mary won't be long,' she replied. 'Perhaps she knows that I have something to talk to you about.' Mrs Rimington spoke seriously, and her son saw that she had something of importance to communicate.

'What has happened?' he asked.

'Your friend, Ogilvie Forward, has proposed to Mary. She has accepted him, and I have approved of her choice. He spoke to me about it yesterday morning, and Colonel Forward was here in the afternoon.'

'Well, mother,' he replied, as soon as he had completed a very long-drawn whistle, 'you know him better than I do. Still, I have seen quite enough of Ogilvie Forward to be able to congratulate Mary from the bottom of my heart, as far as his character goes.—But what about his money?'

'Colonel Forward is very liberal about that. He has offered to buy and furnish a house here at Whitby, and is going to settle twenty thousand pounds on them, in addition to Ogilvie's present allowance, on the day that they are married. It might not be thought very much by some people; but our Mary's husband will be better off in this world's goods than her mother was; and if she loves him, and he will make her a good husband, what should we have to say against it?'

'It is hard to lose Mary, mother; but, as you say, it is her happiness, not ours, that we must care about.—What did you tell Ogilvie?'

'I gave him my consent, and I answered for yours. There was something else which he asked me to tell you; Mary, of course, knows it too. He is not really Colonel Forward's son. Who he really is, who his parents were, he does not know. The colonel adopted him from a workhouse in the south of England. Of course, it was right of him to tell us; but at the same time we know him and like him for himself, and I told him that it could make no possible difference.'

'No, mother; certainly not,' replied her son. Then he added, as if struck by a sudden thought: 'Did he tell you what his name was originally?'

'No, dear.—Why?'

'Oh, nothing. I had an idea; but it is much too improbable to be worth consideration. I suppose, though, that his Christian name is the same as it was before.—But never mind; here comes Mary.—Now, my lady, aren't you ashamed of yourself? Yes; it's no good blushing. Mother's been telling me what you do when I'm at sea. Who is going to fill my pipe in future, I should like to know? However, I suppose that you want to be congratulated; and, on the whole, I think I'll do so.—Now, go and make the tea.'

After breakfast, Rimington announced his intention of going to look up Forward. When he arrived at Colonel Forward's house, the bell was answered by Ogilvie himself, but looking so strangely disarranged and wild, that he could not help asking him if anything was the matter.

'Yes; something is the matter,' he replied, 'and it has made me the unhappiest of men.—But come in, and let me tell you about it.'

Old Colonel Forward was seated at the breakfast table, from which the remains of that meal had not been cleared away. Rising as Rimington entered, he shook him by the hand, saying at the same time: 'I suppose that Ogilvie has already

told you about our misfortune? Poor boy, it is hard for him to bear. For myself, it does not matter; but for your sister and him it is hard, very hard.'

'No, sir,' replied Rimington; 'I don't know what your trouble is; but it must be very great to affect you thus.'

'This, then, will tell you,' said the old man, putting into his hand a business-looking letter which lay upon the table. It was the announcement of the failure of a Mining Company.

Rimington read it through, and then put it down and looked at the colonel for further information.

'My whole fortune was in that undertaking,' he said simply; 'and now my son and I are penniless.'

'And now,' said Ogilvie, 'you know why I am the unhappiest man in the world. Yesterday, I would not have called the Tzar my uncle. Now—what is there left for me to do but to tell your sister that I have not enough to offer her a meal, let alone a roof to'—

'But, Forward, you don't think that Mary, you cannot think that she'—

'That she would turn me away if I came to her a beggar in rags? No; God forbid! But in honour I cannot now ask her to be my wife. You don't understand how I am placed. It's not as if I had a couple of hundred, or even one hundred a year left. Then, with my pay, we could live in India, a soldier and his wife; and my father would come too. That was my one hope when first this cursed letter came. But we shall not have a farthing—literally, not a farthing—except this house and the clothes we stand in. I must leave the army.—But she will wait,' he added passionately. 'Say, as her brother, that I may ask her to wait. My father and I are going out to Australia, and I will work as never man worked yet to make a home for him and her.—It can gain nothing to put off telling her; I will go at once.'

'Wait a minute,' cried Rimington, as Ogilvie was leaving the room. 'I can't tell what, but something says that there is yet hope. It is a very small chance; but the thought of it crossed my mind this morning, and I can't help thinking of it.—You were not always called Forward. What was your name before?'

'Whittlechurch.'

Without saying a word, Rimington burst out laughing. It was now Ogilvie's turn to look surprised.

'Why, man, you are a millionaire! There is a fortune waiting for you.'

'What?'

'I mean exactly what I say. There is a fortune waiting for Ogilvie Whittlechurch, and there are detectives scouring the country to find him—to find you.'

At this moment there was a ring at the bell, and the maid brought in a card: 'Mr J. PRYER, Detective Department, Scotland Yard.' At the bottom was written in pencil: 'To speak with Captain Forward on important business.'

'Why, here's the very man!' cried Rimington, laughing. 'He already looks on you as a millionaire, and shows it by giving you brevet rank.—Well, I'm off, and shall expect you at Rose Cottage in an hour's time at the latest, holding

your head up with all the dignity of your new-found thousands.'

His first visit was to the police station, where some very startling news awaited him. Miller's body had been picked up at the foot of the cliffs, just under a well-known dangerous place, about half a mile from where the struggle took place. He must have doubled, to throw his pursuers off the track, and then, venturing too close, without a sufficient knowledge of the neighbourhood, have slipped and fallen. But the strangest part was yet to come. On the body had been found a cheque for the extraordinarily large sum of fifteen hundred pounds, signed Pedro Bersaño.

Then Rimington understood what had happened. He asked to speak to the chief inspector, who happened to be then at the station. They had a long talk in private, of which it is only necessary to give the last few words. 'So, taking it all together, sir, I don't think there is any case,' said the inspector. 'I suppose that the gentleman's death would be no advantage to this Bersaño now?'

'No.'

'Then, sir, I think that the best thing to do will be to leave matters as they are. You see you have no proof, and the man is out of the country by now. If the sailor had actually attacked your friend, the case would be weak enough; but as it stands, I call it hopeless.'

Rimington thanked the inspector and walked home.

His mother was sitting in the garden. He could see Ogilvie and his sister walking together by the sea.

'Georgie,' said Mrs Rimington, 'how long shall you have ashore?'

'Nearly three months.'

'I thought so; and that was why we've just settled that the marriage shall take place towards the end of November.'

THE MONTH: SCIENCE AND ARTS.

Nor the least interesting episode in Mr Stanley's wonderful story of his last journey in the 'Dark Continent' is his account of the poisoned arrows used with such deadly effect by the natives against his followers. The exact nature of the poison used remained an enigma until he discovered in one of the villages several packets of dried red ants, and learnt that the poison was procured from them. The insects are dried, ground to powder, and cooked in palm-oil, and the mixture is applied to the points of the arrows. The noxious compound owes its power to formic acid, which exists in the bodies of ants, in certain caterpillars, and even in stinging-nettles. When pure, this acid has a most corrosive action on the skin, producing blisters which are difficult to heal. Its action was no doubt especially deadly to those whose frames were already much weakened by hunger and over-exertion.

The Corinth Canal, which was to have been completed last year, will not, according to the Report of the British Consul-general at Patras, be opened until November 1891. The reason of the

delay is found in some unforeseen difficulties which have arisen, one of which is the occurrence of earth-slips, which will have to be guarded against by protecting walls. The estimated amount of earth to be removed was eight million cubic metres; but it is now found that this must be increased to ten millions. The entire length of the canal is just under four miles, and no further obstacles are anticipated to the successful conclusion of the works at the time stated.

M^r Rodier of Tambred, New South Wales, seems to have hit upon a successful method of dealing with the rabbit-pest, and asserts that in a period of eight months he has cleared his part of the country of the creatures. His plan is to employ nets and ferrets in the ordinary way for capturing the rabbits; but while the females are destroyed, all the males taken are again allowed to run loose. The result is that the does are soon so reduced in number that the natural balance between the sexes is destroyed, and confusion reigns supreme. Moreover, the few young rabbits which are born are quickly destroyed by the bucks. It would seem that M. Pasteur's method of infecting food with the microbes of chicken cholera is effectual in so far that the rabbits are killed that partake of the food; but, contrary to his anticipations, the disease does not prove to be contagious to other rabbits.

The incrustation of steam-boilers has always been a matter of pressing importance to engineers, and many remedies have been proposed to obviate what is not only an inconvenience but often a source of danger. The incrustation is due to the mineral matter, chiefly lime, which is contained in all hard waters, and which is deposited on boiling, as we can see by looking into any kettle that has been in use for even a short time. A simple remedy has been tried by an Italian engineer, Col Potto, and it is said with complete success, in a boiler of twenty horsepower, containing one hundred and twenty-six tubes. He introduced into the boiler every week two kilos (about four and a quarter pounds) of sugar, with the result, that after four months' continuous working, only a very thin film of incrustation was formed, and this was easily removed by simple washing. Without the treatment with sugar, the same boiler had previously become incrustated in a period of six weeks. The method has the merit of simplicity and cheapness, and many will therefore be disposed to test its efficacy.

We are far behind our American friends in the matter of electric illumination, but it is to be hoped that our dilatoriness will at least enable us to benefit by the experience of others. But there are at last signs that the question is being taken up in this country in earnest. The London Electric Supply Corporation are establishing immense works at Deptford, near Greenwich, from which place the current is to be carried by cables to the metropolis. To show the vast scale upon which these works are projected we may mention that they will contain the largest dynamo-machines in the world. An ingot of steel weighing seventy-five tons, the biggest ever cast in Scotland, has just been produced by Messrs Beardmore of Glasgow. Out of this vast mass of metal is to be turned a shaft for one of these machines. This shaft is one of three, and will be twenty-six feet

long, and three feet in diameter, with a twelve-inch hole through its centre. When thus finished, it will weigh twenty-three tons.

Professor Hartley has found that a small quantity of ozone in a tube two feet in length—presumably containing air—gives a distinctly blue colour. He therefore is led to believe that the presence of this little understood medium may have an influence in determining the sky colour.

We have recently learnt from the Chancellor of the Exchequer that the consumption of coffee in this country is gradually falling off, and although he attributes this to the rivalry of cocoa, there is clearly another reason which it is not difficult to discover. Few persons, we venture to say, know what genuine coffee is like, and what a delicious and healthful beverage it constitutes. It is mostly sold mixed with chicory, and, it is said, other things cheaper than chicory; and such coffee mixtures contain so little coffee that it is not justifiable to call them by that name. It may be said that buyers can guard themselves against such practices by purchasing the berry whole and grinding it for themselves. This is commonly done in well-ordered households; but the great majority of coffee-drinkers will not take the trouble to do so, or are often so situated that they are unable to do so. But even here the fraudulent trader steps in to render such a precaution abortive, for he manufactures the berries themselves in a manner so true to nature that they are difficult of detection. According to a German chemical journal, this nefarious industry is carried on by certain firms in Cologne, where the artificial beans are made by machines devised for the purpose. The material of which they are compounded is burnt flour or meal; but they can be distinguished from genuine coffee by the circumstance that they sink when immersed in ether, whereas the true coffee-berry will float in that liquid.

Execution of criminals by electricity, instead of by the hangman's rope, is now the law in the State of New York; and although, happily, no criminal has yet qualified himself for this new mode of death, some curious experiments have been made on dogs, calves, and horses, with a view to find out the point in the body to which the current can be most efficaciously applied to insure an immediately fatal result. The experiments were carried out at Edison's laboratory, and an alternating current was employed—that is, a current which changes its direction about three hundred times per second, and which is therefore different from a battery current, which has one constant direction. For each victim the wires were arranged differently, so that the charge might enter by the brain, the heart, &c.; and in every case death was instantaneous and, as far as could be judged, utterly painless. The bodies of the animals were in noway disfigured, and in the case of the calves, were taken away by the butcher who brought them, to be dressed for food. We may hope that at no distant day the electric current will be used generally in slaughter-houses. As to its more solemn employment in our gaols, we shall gain experience from the operation of the new law in America.

Hitherto, scraps of tinned iron have been a waste product of many trades, and it is not uncommon to see large quantities of this metal to rubbish-heaps. It is not worth gasting, for it

is too hard and granular for any purpose, except, perhaps, the making of weights; and the modern weighing-machines are driving the old-fashioned weights out of use. But, according to the *American Manufacturer*, scrap-iron can now be turned to better account. The pieces are first of all cut into certain sizes, and are then fed into a machine which folds the metal upon itself, compresses it, furnishes it with a point and a head and turns it out a finished nail, which can be driven without breaking into the hardest wood.

Dr B. W. Richardson has recently called attention to the good treatment of the animals at the Home for Lost and Starving Dogs, Battersea, London. Any dog found wandering in the streets is taken to this Home, and kept for a certain time, in case an owner, or failing that, a purchaser, is found for him. Utterly vagrant and valueless dogs are put to a painless death in the lethal chamber devised by Dr Richardson, and no fewer than a hundred thousand have been so destroyed. Five dogs affected with rabies have been taken off the streets and destroyed here. Dr Richardson has contrived a lethal muzzle for dogs, which can be used in the streets by the police, and also a similar apparatus for horses. We presume that this latter would be used in cases of glanders, that terrible disease which is contagious between the horse and man.

A tunnel on the Rhondda and Swansea Bay Railway, Wales, has just been completed. It is two miles in length, and runs through such a mountainous country that it was impracticable to drive any shafts into it from above during the progress of construction. In spite of this, when the two headings which were driven from either end met, the one formed a perfect continuation of the other, and the levels did not differ to the extent of half an inch. The object of this railway is to connect the extensive coalfield of the Rhondda Valley with the port of Swansea.

Mr Julte has recently made a communication to the French Academy of Sciences with reference to a new process for hardening plaster of Paris, by which that comparatively friable compound is made so dense and hard that it can be used for flooring purposes. The plaster, of good quality, is mixed with one-sixth its weight of finely sifted and recently slaked white lime. This mixture is used like ordinary plaster, but with as little water as possible, and with great expedition. When thoroughly dry, it is treated with a saturated solution of either zinc sulphate or iron sulphate (white vitriol and green vitriol are the common English names for these salts). The first will cause the plaster to remain white, and the latter will by gradual oxidation give it the colour of iron rust, and an application of linseed oil will give this reddened plaster the appearance of mahogany. It is obvious that this method of rendering plaster hard, if as effectual as its author asserts, will lead to its employment for many purposes for which at present it could not be used.

The British Museum is now furnished with a complete system of electrical alarms, so that the occurrence of fire or outrage by dynamite can be immediately signalled to the firemen's room, while at the same time the police and gatekeepers are put on the alert. It will be remembered that in the abortive attempt to blow up part of the Tower of London by dynamite, a few years back,

the offender was caught through the prompt action of closing the Tower gates and subjecting every one within the walls to a searching examination.

In a paper read before the China branch of the Royal Asiatic Society, Captain Moore, of Her Majesty's ship *Rambler*, gives an interesting description of the 'bore' or tidal wave which often occurs in Hangchow Bay. This 'bore' is caused by the tide in the bay meeting the current from the river, and it travels up stream at the rate of from ten to thirteen miles an hour. The height of the advancing wave reaches fourteen feet, and it is followed for some distance by agitated water in which no small boat can live. The rush of the wave is so strong that the *Rambler* was covered with spray as its waters broke against the broadside of the ship. A vast wall has been built by the inhabitants at the mouth of the estuary, to protect the country from the 'bore,' and it is strengthened in one place which is exposed to its full force by a buttress two hundred and fifty-three feet long and sixty-three feet wide. Behind this wall the boats are drawn up for shelter when the wave is expected. It will be remembered that on some rivers in our own country we have the same phenomena on a far smaller scale.

The fading and yellowing of photographs after they have reached a certain age has long been a reproach to that method of printing from the negative which is known as silver printing on albuminised paper, and to a great extent that method has of late years been superseded by others which are more permanent in their results. The last new method of this kind is that just introduced by Mr Valentine Blanchard, and which he calls the Platinum Black Process. In this system the picture is printed on a silver-prepared paper (not albuminised), and the image is changed to permanent platinum by after-treatment with a salt of that metal. From specimens which we have seen, we predict a great future for this process. It is especially adapted to the wants of amateurs, whose troubles in photography generally begin when they commence printing from their negatives.

According to a New Orleans paper, the mortality among the negroes of that city is double that of white persons; and the same may be said of other southern cities. The reason for this increased mortality among the blacks is said to be found in their neglect of hygienic laws, lack of comforts and conveniences in their homes, and unrestrained indulgence in vicious practices. On the other hand, the negroes of New Orleans seem to be singularly free from the attack of diphtheria, for out of thirty-three cases of that disease in one month three only were credited to negroes.

So much has recently been heard about the untold wealth of the ruby mines of Burmah, that we are apt to forget that another valuable product of that country is found in its forests of teak-wood. Now that we build our ships of iron, this wood does not perhaps command the importance which it possessed in past times; but it has so many valuable properties, that an unlimited supply of it would soon find for it new employment. For hardness and durability it has few equals, while at the same time it is easily worked, although, from the silex which it contains, it soon blunts the best tools. But this same siliceous

element renders it free from the attacks of insects; while nails and screws driven into the wood do not rust, this last advantage being probably due to the oil which it contains.

At a time when we are making a great addition to the number of our ships of war, criticism by a competent outsider is worthy of respectful attention. Admiral Porter, of the United States navy, has assumed this rôle in two papers which he has published on 'The Naval War of the Future,' in which he supposes, by way of illustration, that the English and French fleets have come into conflict. While the big vessels are busy with an artillery duel, their discomfiture is brought about by 'sneaky little craft,' which entangle the propellers of the larger vessels with iron wires and render them helpless. Then the little torpedo boats come upon the scene and sink the iron-clads. In a word, the admiral does not believe that our expensive monsters will fulfil their promise; while dynamite projectiles and long-range dynamite guns will be more than a match for them. He instances the astonishing result lately produced experimentally when a shell containing only two and a half pounds of dynamite, propelled from a seven-inch gun with the comparatively small charge of twenty-three pounds of gunpowder, was fired against a seven-inch iron turret weighing thirteen tons. This structure was carried bodily a distance of twenty-five feet, and its iron plates were torn asunder.

Bromine, one of the elementary bodies, a dark-brown volatile liquid, which is obtained from sea-water and saline springs, and is a by-product of certain chemical operations, is coming into use as a disinfectant and deodorant. It has long been used in surgery for the treatment of foul ulcers, &c.; and now that it can be obtained at a comparatively cheap rate, it is likely to find a far more extensive employment. In a pure state, it is most corrosive, and its vapour is most irritating to the nose, throat, and eyes. But for general use it would be diluted with about eight hundred parts of water, in which state it is quite innocuous.

Mr B. Piffard describes, in the *Chemical News*, the simple preparation of a pigment which seems to possess the appearance and properties of Indian ink. An excess of camphor is allowed to remain for twenty-four hours in strong sulphuric acid, when the mixture presents the appearance of a reddish gelatinous mass. This is heated, when it effervesces, and fumes of sulphurous acid are given off, leaving a residue which is intensely black. Further evaporation causes the excess of camphor and the acid to be driven away, and the remainder forms a black pigment, which can be applied to paper or other surfaces in the usual way.

In a paper recently read before the Royal Institution by Sir James N. Douglas, it was stated that Faraday was first consulted by the Trinity House as to the capabilities of the magneto-electric light in 1858, and that experiments were made at the Nore with a view to test its efficacy as a luminant for lighthouses. It was then that Faraday—whose discoveries had given birth to the new light—reported that the luminant was not only fit for the particular purpose in view, but that it gave prospects of development the limits of which it was not possible to

foresee. These words are indeed prophetic, when we look around us and see the immense activity on every side which is due to various schemes of lighting by means of the dynamo-machine, which is the improved magneto-machine of Faraday's time. It is now possible to obtain a light of one hundred and fifty million candle-power, which, of course, is far in excess of any requirement. Sir James Douglas recognises the advantage of the brilliant light which electricity affords for salient headlands and isolated rocks at a distance from the coast, while oil and gas lights are more suitable for confined navigation. All are practically valueless in thick fogs; and the problem of penetrating such clouded atmospheres still awaits solution. It is proposed to use sound-signals in the shape of dynamite cartridges, which can be exploded by an electric current; but, unfortunately, fog is an impediment to sound as well as to light.

Telegraphic instruments which deliver their messages in the form of printed type were looked upon when they were first introduced as marvels of constructive skill, but they are now too common to elicit much remark. Machines which are constantly reeling out yards of 'tape,' upon which are plainly printed the latest news, and the last quotations from the Stock Exchange and various markets, are now familiar things in the halls of clubs and other places of public resort. As the printed tape accumulates, it is cut off in lengths and pinned on a board, so that all can benefit by the news it contains. If not so gathered up, it lies in a heap, and he who wants to consult it is in much the same position as the proverbial searcher for a needle in a haystack. But now that an improved apparatus has been invented by Messrs Moore and Wright, we may expect these difficulties to disappear. The 'Column' Printing Telegraph explains its own mission, which is to do away with the reel of tape and to print the words in column form, in the same way that a type writer presents it to the reader's eye. The instrument is wonderfully ingenious, and does its work with accuracy and despatch. Several Column printing-machines can be operated from one centre, as in the case of the older form of instrument.

A TRUE SNAKE-STORY.

BY DR A. STRADLING.

I LABEL mine so, because the vast majority of snake-stories are untrue—palpably and absurdly untrue to those who have studied anything of the nature or habits of the creatures to which they professedly refer. They pass muster, however, in many instances because so little is known of the manners and customs of reptiles in general and of serpents in particular; and it is extraordinary to note how even the best scientific works on natural history, whilst accurately describing the anatomical and physiological characteristics of a snake, will yet frequently perpetuate and lend authority to the most vulgar errors in alluding to their mode of life. Again, such is the terror which these 'creeping things' inspire, that in many cases where it is impossible to doubt the

bona fides of the narrator, ridiculously distorted and impossible versions of actual phenomena are given through hurried and horrified observation.

To most people, the very term 'snake' or 'serpent'—for their signification is the same—conjures up the idea of a creature fiendish in cruelty and aggressively inimical to man, gifted with a deadly venom, speed for pursuit, and unutterable malevolence. Yet the poor ophidian is only too desirous to shun notice—I believe there is absolutely no exception to this rule—where he has time and opportunity, though he is frequently surprised, and compelled to act on the defensive, owing to his want of hearing and defective vision. Probably no serpent can see anything distinctly at a distance of three times his own length, though they may be conscious of interception of light, or feel the vibration of an approaching footstep. Certainly, no words can exaggerate the awful power of the poisons of some of the more virulent species—I say poisons, because there may be as many separate and individual venoms as there are venomous kinds, for anything we know to the contrary; though, in considering this most mysterious attribute, we might pause to compare the effects of the tiny, almost microscopic hair-tubules of a tropical nettle, producing violent fever of the whole system, with, possibly, gangrene of the stung limb, or those chemicals which affect the human tissues when subdivided into millionths of a grain. But few know—and perhaps fewer still will believe—that of the whole number of serpent species known in the world, *less than one-eighth* only are venomous, and that one-fourth of these are never seen on land, being inhabitants of the ocean.

Snakes, moreover, seem to be deemed fair game for fiction and falsehood by common consent, and so generally is this fact recognised in America—where most of these monstrous anecdotes are concocted, or at anyrate first see the light of print—that the term 'snake-story' has passed into a byword and a reproach, an epithet which is well understood and acknowledged as a euphemism for that which requires considerably more than the proverbial grain of salt for its deglutition. When the rumour comes of a big fire, or an earthquake, or a great commercial disaster, the incredulous ones shrug their shoulders and say: 'Oh, it's only a snake-story!' Many of these absurd yarns which find a place in the columns of Western papers as pure jokes are quoted as sober facts by the press on this side of the Atlantic, and crop up in the 'Naturalist' department of magazines which devote a portion of their space to that branch of science, especially—and I write it with sorrow—in those which are published for the young. Boys and girls accept so confidently what they read, and form and retain such strong impressions therefrom, that any misleading statement is far more deplorable in their case than one which may appeal to those of more mature years. And they are such capital observers! Some of my pleasantest associations with this subject have arisen through the interest and enthusiasm displayed by young friends in connection with it; and nothing delights me more than the receipt of a letter from some youthful ophiologist—often quite unknown to me—asking for advice about the purchase of a pet snake, the method of its maintenance, or the

compatibility of such an institution with the extent of the writer's pocket-money or the prejudices of his immediate relatives.

Before relating my true snake-story, let me offer a sample of the other brand—the 'snake-story' which is not true. I clipped it from a paper published in the very country in which the scene of the other is located, Guiana.

A boa-constrictor woke up thin and hungry after a three months' nap, and set off to look for his breakfast. He was soon rewarded by the capture of an agouti, which he crushed and bolted whole, after the manner of his kind. His appetite being not yet appeased, he went still farther afield in quest of prey, and presently coming to a fence and essaying to pass through between the stakes, he was stopped midway by the lump in his body which was the outward and visible sign of the defunct but undigested agouti. As he lay in this position, another agouti happened to wander incautiously near his nose, and was seized, constricted, and swallowed in like manner. Agouti number two passes down the serpent's body to join its predecessor, but was stopped on the other side of the fence; and the state of affairs now was that the boa could neither go ahead nor astern, being jammed by his fore-and-aft inside passengers; and in that situation was found, caught, killed, and made into a 'snake-story.'

For the truth of what follows I can vouch, as all the collateral and corroborative circumstances, though not the main incident, came directly under my personal notice.

The wife of one of the overseers on the Enmore estate in Demerara had one morning laid her baby asleep in its cradle while she performed certain household duties. Enmore is—or was at the time of which I write—the largest sugar-plantation in that county, for so are the three provinces called which together make up British Guiana—namely, Demerara, Berbice, and Essequibo. The estate has a station on the little line which runs through several small towns, still bearing their quaint old Dutch names, as far as Mahaica. The baby aforesaid was carefully screened from the blazing heat of the day within a cool green-jaloused veranda, and was lightly covered with a muslin net, to guard its slumbers against the disturbing influence of flies, marabundas, scorpions, spiders, and other small but unpleasant deer, of which this favoured land is the happy hunting-ground. It was three months old, was No. 1, and was the pivot on which the daily life and love of both its parents revolved. I regret to say I have forgotten whether it was a boy or a girl.

Picture to yourself, then, if you can, the horror of the young mother when, on stealing into the veranda to refresh herself with a peep at her unconscious darling, she beheld on the muslin cover a live serpent! She had not been long in the colony, but had already sufficient experience of its teeming reptilian fauna to recognise the blood-red, blunt-headed creature which lay on her child as a coral snake, reputed to be so deadly as to slay a man or horse with its bite in twenty minutes. It had apparently fallen into the cradle from the ledge of the Venetian shutter above, and its weight causing the muslin to bag down, it was unable to raise its body high enough to get over the edge of the wicker-work

and escape, as it seemed to be endeavouring to do.

Terror-stricken as she was, the poor girl by a desperate effort summoned up all her self-control and remained still, knowing that if the baby were disturbed it might by its movement provoke the snake to strike. After watching the ineffectual efforts of the latter to climb the side of the cradle for a few moments, which seemed like hours, an idea flew over her half-numbed brain. She crept gently forward, inch by inch, until by stretching forth one foot she could touch the rocker. Getting her toe underneath this, she slowly raised it until the basket was tilted considerably away from her, and was consequently lowered on the side towards which the intruder was directing its attempts at ascent. The plan succeeded admirably; the unsuspecting serpent wriggled its way up the now moderately inclined plane of the net, retarded in its progress only by the unstable hold afforded by the latter. Its head was already over the edge, and in another quarter of a minute it would have been upon the floor, when the treacherous rocker slipped from her foot, the snake rolled back lower than before, carrying the edge of the narrow curtain down in its fall, and the mother stumbled wildly to recover her nearly lost balance. It was too much for her; the awful tension snapped, and she called her husband's name with a hoarse cry.

Well that she did! He was nearing the house at the time on his homeward way to mid-day breakfast, and just caught sound of that agonised whisper as he crossed the muddy canal. A few seconds later he was in the veranda, reading his wife's bloodless face with wild questioning eyes. No speech could she force through her hot lips; no word spoke he, but he followed her outstretched finger as she pointed to the still swinging cradle. With one dash he seized the muslin and tore it off. Had this been done at first, no doubt all would have been well, but the free border being within the side, the light net slipped from under the weight of the snake, and the reptile fell hissing and writhing upon the naked body of the child, now crying and lifting up its hands towards its mother. There was no moment for thought. Like lightning he gripped the infant by the shoulder and threw it out on the floor, where it fell with a broken collar-bone, but saved!

And it was through being called upon to administer restoratives to the wife and to treat this injury—which may have been caused by the fall, or, more probably, by the frenzied grasp of his powerful hand—that I, in the absence of my friend, Dr D—, whose guest I was, learned the foregoing particulars within ten minutes of their occurrence. The snake was already despatched, and lay on the veranda boards with its head smashed flat by an unnecessarily tremendous stamp of the paternal heel. I may just say that youth and a good constitution, in which the Morayshire breezes were not yet dissipated by fever and ague, enabled the mother to throw off the nervous illness with which she was threatened; and that, although the condition of the child's shoulder and the pain attending it naturally caused the parents great grief, it recovered perfectly without any impairment of

the use of the arm. The fragments of the snake were gathered up and preserved in a glass jar of white rum from the factory 'still'; and long afterwards as he told the tale the big black-bearded Scotchman's lips would go white with anger and his forehead bead as he shook his fist at 'yon devil' in the bottle. And I dare say that it moves him so to this day.

For I had not the heart to tell him that the creature was *harmless*, and that he had broken the baby's collar-bone over a poor worm who could do less injury than a mosquito. Fer- vently do I hope that they have never learned it. I think the reptile could hardly have been recognised after its immersion in the coarse *cacha*; but as it lay recently dead, there was no mis- taking it for anything else than *Scytale coronatum*, a species of somewhat vivid colour, inhabiting tropical America and some of the West India Islands, but wholly devoid of venom. The error is typical of a very common one in popular nomenclature. The really poisonous coral snakes of these countries should properly be called 'corral', as their name was originally derived from the Spanish by reason of their colours, vermilion, black, yellow, and white, being dis- posed in 'rings' around their bodies. (The in- tensity of their lethal power, by the way, is much exaggerated, the great viperine serpents of those regions, such as the rattlesnake, *fer-de-lance*, and bushmaster, being much more virulent.) But by corruption the term 'coral' has come to be applied to any snake which bears some degree of red in its coloration, and has carried a veno- mous reputation along with it. If there were anything in a name, one would be compelled to admit that this same *coronatum* should be the 'coral snake, *par excellencer*, seeing that the whole of the upper surface of its body presents the brilliant hue of that gem. 'Corral', how- ever, it could not be, as the colour is plain without pattern from stem to stern. And if the declaration of its innocence forms a damp and depressing appendix to this tale, kindly remem- ber, in extenuation of the circumstance, its ex- ceptional character as that seeming paradox, a *true* snake-story.

THE ELECTRICAL TREATMENT OF SEWAGE.

THE subject of the best means of sewage precipita- tion and purification at a moderate cost is one that has agitated the minds of scientists for years. Various systems of chemical treatment have been propounded; but a distinct advance seems to have been made by Mr William Webster, F.C.S., who proposes to treat the sewage by direct contact with electricity, the sewage being resolved at once into its chemical elements, and precipitated in the form of sludge, and rendered innocuous at the same time. By permission of the Metropolitan Board of Works, Mr Webster has erected, at his own cost, at the Southern Outfall Station at Crossness, experimental works capable of treating the sewage at the rate of fifty thousand gallons per day, the process at present being only carried on intermittently; and the system was inspected and reported at the rate of about twelve thousand gallons per hour, on the 27th of March, by a number of representatives of the press.

The sewage is pumped from the main sewer into a shoot filled with iron plates, which, being connected with a dynamo, are transformed into electrodes. The sewage passes by gravitation between these plates, and the contact with the metal gradually causes the organic matter to rise in small flocculent particles. The action produced by the electric current splits up the water and sodium, magnesium and other chlorides, which are always present in sewage, into their constituent parts. At the positive pole, chlorine and oxygen are set free, and these elements are liberated in a nascent state, a condition in which they are intensely active, so that the organic matter in the sewage is rapidly oxidised and burnt up to in- nocuous compounds, and produces hypo-chlorous acid; the positive iron plate is attacked, and ferrous hypo-chlorite formed. A portion of the hypo-chlorous acids attack the organic matter, putrefying sewage having a strong affinity for oxygen. At the negative pole, ammonia, potass, soda, magnesia, &c., are obtained. The particles of matter gradually accumulate at the top, and are run off into settling-tanks, and afterwards the sludge may be pressed into cakes or otherwise disposed of. The effluent is then pumped off, and is perfectly clear and inodorous.

The relative merits of the cost of this in com- parison with other systems is a point with which we cannot deal; but a distinct advance in sani- tary science seems to have been made by the application of electricity to sewage purification. Any improvement on the system of sewage-dis- posal at present in force will be welcomed by the public; and the electrical system seems to possess peculiar advantages over chemical treatment.

RONDEL OF SPRING.

Cuckoo! Cuckoo! How wistfully
That clear soft note of spring breaks through
Our tearful Lent: hark!—one, two, three—
Cuckoo! Cuckoo!

To where old dreams their spells renew,
Thou art the 'open Sesame,'
And bringest wondrous things to view.

O sweet refrain! Time was when we,
From hearts no sorrow could subdue,
Gave back the call with childlike glee—
Cuckoo! Cuckoo!

P. W. ROOSE.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
 - 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
 - 3d. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
 - 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.
- If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

PRICE 1½d.

THE HOME OF THE MORTIMERS.

THE southern part of Herefordshire, with its cathedral city, and the ever-winding, ever-changing Wye, has for long been an object of attention to the health-seeking tourist; but somehow or other, the northern part of the county has been neglected; and yet, for historical associations, for its fish-abounding rivers, and its charming and varied scenery, where could a few weeks be spent to greater advantage? If you are interested in ecclesiastical architecture, a visit to the ancient Priory Church of Leominster will afford you magnificent specimens of late Norman and Early English styles; or at the villages of Yarpole and Pembridge, quaint country churches with detached belfries some yards distant from the main buildings. Should your tastes lie in the direction of history, the district abounds in the remains and sites of ancient British and Roman camps, for as early as the first century of our era the Romans fought with and conquered the Silures, by whom Herefordshire was then populated; and at still later periods the battle of Mortimer's Cross, the occupation of Leominster alternately by the rival Royalist and Parliamentary armies, and the visits of the two unfortunate Charleses, will afford food for reflection, and matter for any amount of mental picture-painting.

I wonder how many readers of *Chambers's Journal* have explored that much neglected but most engaging ruin in the extreme north-western corner of the county known as Wigmore Castle? It is more than probable few have ever heard of such a place—a place, withal, rich in traditions of the past, and closely connected with the lives of several generations of Mortimers. If you should ever be in the vicinity of Leominster, a town of quaint old streets, pay a flying visit to the home of the Mortimers. The distance is about nine miles, the road excellent, the scenery not to be surpassed. You can drive; and host Bedford of the *Royal Oak Hotel* will provide you with as good a 'pair in hand' as you can desire. Or, you can take the train to Kingsland Station,

and walk the remaining five miles. Or, if your legs are muscular and your lungs sound, you can tramp the whole distance, an alternative much to be recommended.

It was one of those deliciously cool days in the early part of September that I chose for the walk to Wigmore. Providing myself with a trusty walking-stick, a pocket telescope, a local guide-book, and an Ordnance Survey map of the district, I left Leominster by the West Street and Bargates; and on arriving at the cross roads, just a mile out of the town, paused for a few minutes at Barons' Cross, the spot pointed out by tradition as the place where the barons of the royal army from the south and those from Leominster met for consultation on their way to check the advance of the opposing forces under Edward Mortimer from the north. A farther trudge of three miles through a really luxurious country, fruit-laden orchards, and field upon field of golden grain, only waiting the reaper's sickle, to my right and to my left as far as the eye could reach, with here and there a hopyard, where scores of busy fingers were deftly plucking the rich clusters from the gracefully climbing bine; the scene being interspersed by trees, upon whose leaves artist Nature had already begun to paint those rich autumnal tints which no Royal Academician has yet been able to put on canvas—and so I reached Kingsland, a charming straggling village quite a mile in length, with the church on my left dedicated to St Michael, and founded in 1290 by Edward, Lord Mortimer, to whom the manor then belonged. A mound near the rectory was pointed out to me as the site of an ancient castle, by the believing said to be the burial-place of King Merewald, or rather of his body, since his head is traditionally reputed to have been one of the grinning gold-bedecked skull relics on the altar of the Priory Church at Leominster.

Another half-mile, and I found myself reading the inscription on 'The Monument,' a stone pedestal erected in 1799 to commemorate the battle

fought on February 2, 1461 (erroneously stated on the stone to have been 1460), between the forces of Edward Mortimer, Earl of March, afterwards Edward IV., on the side of York, and those of Henry VI., on the side of Lancaster. The battle of Mortimer's Cross lasted from nine in the morning till sunset, the Lancastrian army being entirely routed, four thousand 'good men and true' being left dead and lying on the field. Owen Tudor, great-grandfather of Henry VIII., and many Welsh chiefs and Englishmen of distinction, were taken prisoners, some being executed at Leominster, others at Hereford. 'This,' says the inscription, 'was the decisive battle which placed Edward IV. on the throne of England; he was crowned king on the 5th of March following.' This latter statement is incorrect, as Edward was not formally crowned till the 28th of June. Standing with my back to the pedestal and looking northwards, the great 'West Field,' where the Lancastrian generals Pembroke, Tudor, and Ormonde had so skilfully disposed their forces on the eve of the battle, lay like a panorama before me. There in the distance was the entrance to the valley of Aymestrey, through which the forces of Mortimer advanced from Wigmore; and there on the plain of Kingsland I could in imagination see the scantily clad Irish soldiers under Ormonde fighting fiercely against the more disciplined warriors under Richard. And then I thought of the words put into the mouths of Edward Mortimer and Richard Plantagenet on the eve of the battle, in Shakspeare's play of *King Henry VI.*:

Edward. Dazzle mine eyes, or do I see three suns?

Richard. Three glorious suns, each one a perfect sun; Not separated with the racking clouds, But severed in a pale clear-shining sky. See, see! they join, embrace, and seem to kiss, As if they vowed some league inviolable: Now are they but one lamp, one light, one sun. In this the heaven figures some event.

I resume my tour, the road taking me over the very spot where the combat waxed fiercest; and there away on the right, among the trees, was just the faintest peep of Lucton School, one of those old educational institutions of the last century over which so many hard words have been bandied between the Charity Commissioners on the one hand and the local bigwigs on the other. Feeling just a little thirsty, I essayed a halt at an old wayside inn, known to artists and disciples of Isaac Walton as a real haven of rest and refreshment for the weary of the human kind. Landlord Roberts welcomed me, as I am told he ever welcomes all callers, and as most British landlords, out of London at all events, welcome touring callers generally. A 'cup' of real Herefordshire cider, the usual passage of words in true English style anent the weather past, the weather present, and the meteorological possibilities of the future, and I had once more put foot to ground in the direction of Aymestrey, a name made familiar to geological students in Murchison's *Siluria*. To the right is the church of St John and St Alkmund, containing an ancient monument to the memory of the founder, Sir John Lingen, the firm friend and ally of Edmund Mortimer. To the left are the famous Aymestrey limestone quarries; and as I cross the old bridge

over sparkling Lugg as it rushes in hot haste to join its sister Wye at Hereford, I find myself in a narrow gorge, where the steep tree-clad hill-sides remind me very much of the beautiful pass of Aberglaslyn in North Wales. Emerging from the valley, towering on my right is Croft Ambury, on the summit of which the brave British chief Caractacus encamped when retreating westwards before the victorious legions of the Roman general, Ostorius Scapula. Caractacus had made a bold stand on the arrival of the Roman forces in Siluria, and had been driven from camp to camp, until, as a final attempt to stay the onward rush of 'the foreigner,' he strongly intrenched himself on the top of a hill near Brampton Brian, just away to my left, called Coxall Knoll, where, however, he was again defeated, his wife and daughter being taken prisoners on the field of battle, and he himself compelled to flee into the north, where he was treacherously given up to the Romans, and conveyed in triumph to Rome.

Wigmore reached at last, in every respect a characteristic English village; and there, high up on a curious eminence, is the parish church, with the quaintest of ivy-covered towers. A guide-book informs me that this church existed before the reign of Stephen, and that Sir Hugh de Mortimer, Lord of Wigmore (who flourished in that reign), made a grant of the benefice of Wigmore to the canons of the adjoining priory of Shobdon, afterwards monks of Wigmore Abbey. Turning to the right through the fields, there, majestic even in decay, is the once mighty home of the regal Mortimers. Crossing the moat, the traces of which are very perfect, and passing under a low-arched gateway covered with a mantle of rich ivy, I found myself in the courtyard, with the ruins of the keep and banqueting hall on a mound in front. Some of the outer walls and towers of the castle are in a good state of preservation, and give evidence of the extent and importance of the place when the Mortimers swayed the fortunes of the English crown. Just inside the entrance, on the left, an interesting discovery was made in 1870. The then tenant of the farm, of which the ruins form a part, found that at a particular spot the place sounded hollow; and on making excavations, steps were come to, leading to a strong door with massive hinges. Passing through the door and down two or more steps, a room was discovered, to the walls of which were affixed two very massive iron staples. Among the rubbish were tiles of very good workmanship, one of which had on it the *fleur-de-lis* of France, quartered by the royal arms of England (Edward IV.). From the appearance of the room, it must have formed one of the dungeons of the castle. The view from the keep is extensive towards the north and north-east. Hill and dale, verdure-clad valleys and fern-topped hills; miniature orchards and cosy-looking farm-homesteads; and about a mile from the castle can be plainly distinguished the spot where Wigmore Abbey once stood, and in which several of the Mortimers were buried. All that now remains of this is the old Grange of the Abbey, a fine timber building, and a perfect example of the twelfth, thirteenth, fourteenth, fifteenth, and sixteenth century styles of architecture. The outer portions of the Abbey remain, but are divided to

meet the requirements of a modern farmyard. The old Abbey barn is pointed out to visitors as one of the finest specimens of Abbey barns in the country. It has a large and lofty timber roof, some of the beams being of immense size, and surpassing anything of the kind at the present day. A copy of the abbot's seal is still extant.

The walls of the keep of Wigmore Castle are in a good state of preservation; and the banquetting hall must have been of fine proportions. The earlier history of Wigmore Castle and the Mortimers is somewhat clouded in the mists of myth; but it is probable that the castle was a stronghold of considerable importance during the disturbed times of the numerous Welsh incursions into the Marches. A Ralph de Mortimer married Glwadya Dhu, daughter of Llewellyn of Wales. A Roger Mortimer fought for Henry III. at the battle of Northampton; and at a later date we find a Roger de Mortimer, a minor, placed by Edward II. under the guardianship of Piers Gaveston. This Roger de Mortimer was made Lord-lieutenant of Ireland in 1316. In 1322 Roger was imprisoned in the Tower for joining in the conspiracy against Piers Gaveston and Hugh Le Despenser, the king's favourites; but he escaped to France, where he lived in criminal intimacy with Isabella, wife of Edward II., whom he persuaded to return with him to England in 1326, and to dethrone her husband. The queen created Roger de Mortimer, Earl of March; and in recognition of the honours and favours conferred on him, he sumptuously entertained the queen and the young king her son for some days at his castles of Ludlow and Wigmore. Roger, Earl of March, was executed at Tyburn in 1330. Edmund de Mortimer, great-grandson of Roger, married Philippa Plantagenet, daughter of Lionel, Duke of Clarence; and it was by this marriage his descendants became entitled to the crown of England, his son Roger de Mortimer, fourth Earl of March, being declared by the parliament of 1385 heir to the throne. Edmund's second son espoused the daughter of Owen Glendwyr; and his daughter Elizabeth was married to Henry Percy, better known in history as Hotspur. The fifth Earl's daughter, Anne, was married to Richard Plantagenet, son of Edmund Langley, Duke of York, grandson of Edward III. The frequent intermarriages of the Earls of March with the reigning family were the causes of endless troubles and conspiracies; but the decisive battle of Mortimer's Cross, where the Lancastrians were so disastrously beaten and the Mortimers placed on the throne, ushered in for a time a somewhat more peaceful era.

I could not help thinking of those days when might rather than right ruled; when every man's hand seemed uplifted against his brother's, as, standing on one of the fast crumbling walls of the old keep, I gazed around on the ruined towers, and the grass-grown spot where once stood the noble banquetting hall in which the first Earl of March entertained Isabella, the faithless wife of Edward II. Times have indeed changed since then, and so have the men with them. The Mortimers and Warwicks, kings and king-makers, have gone the way of all flesh. Where five hundred years ago within were 'sounds of revelry by night,' is now heard but the bleating of the timid

sheep, or the laughter of the happy excursionist. Where, four centuries since, were heard without the clash of arms and the angry shouts of contending armies, is the lowing of contented cattle, or the monotonous whirr of the peaceful reaping-machine as the golden grain falls gracefully to the ground ready for the empty garner.

But the day was waning, and the sun was already preparing to dip his ensign in the west in honour of the rising of the night's monarch in the far south-east, so I somewhat reluctantly descended the hill, giving the ruined home of the Mortimers a parting look before emerging on to the road which was to take me back to Leominster. The shadows of evening had already been curtain-like drawn over the surrounding landscape as I retraced my steps past the old inn at the cross roads, and on over the battlefield of Mortimer's Cross; and as I paused for a moment to look at the pedestal which records a great day's bloody work, fancy conjured up the men who had done their parts in the fearful contest, and I thanked the fates which had cast my lines in more peaceful times and more pleasant places.

I have been much indebted for information concerning the Mortimers to a little work, *The History of Wigmore and the Adjacent Neighbourhood*. It may interest my readers to know that I have already called the attention of the Society for the Preservation of Ancient Monuments to Wigmore Castle, and that an official visit to the ruins is in contemplation.

JOHN VALE'S GUARDIAN.

By DAVID CHRISTIE MURRAY,

Author of 'VAL STRANGE,' 'JOSEPH'S COAT,'
'RAINBOW GOLD,' etc.

CHAPTER XXIII.

TOBIAS had taken a day's holiday without troubling his employer with the formality of asking for it. St Monday was a familiar of his. He had booked for Birmingham by an early train, had slunk furtively into the bank, and there presented his cheque with a manner so shy and guilty as to draw upon himself the suspicion of the cashier, who narrowly examined the document before rendering it into coin of the realm. The fat man trembled with anguish at the thought that he might be seized and that Snelling might deny his signature. When the ten golden sovereigns were shovelled on to the counter, he took them up with shaky fingers and carried them out into the street in his moist hand. His pockets were never very trustworthy, and the last had given way that morning, so that he was compelled to carry the remnant of Saturday's wages in the lining of his hat, where half-a-dozen penny pieces, conspicuous among the scattered silver by their size, galled his baldness. He made his way straight to the great emporium of ready-made clothes, whose portals he had so often entered in fancy, and there ordered new raiment. It was not an easy thing to fit Tobias's figure off-hand, but the shopman made an approach to success; and in the space of half an hour he emerged upon the street in a new suit of gleaming black, a new cheap silk hat, new boots considerably too large for him, a new false front

with high shirt collars, and a new cravat of violent colours. He bore his old discarded garments folded into a neat brown paper parcel under his arm, and made by instinct for the nearest place of public refreshment. There he took a glass of rum-and-water, and left his parcel in charge of the barnmaid on duty, whom he charmed by the sesquipedalian fluxuey of his converse and the affability of his manner.

Mr Orme knew nothing of the Philosophy of Clothes, but he felt that his new garments made a new man of him, and as he rambled through the sunshiny streets, his bosom dilated with the thought that his exterior aspect defied criticism. He determined to spend the day in sightseeing, and made a virtuous resolve against the enemy Rum. It would not be dignified to take too much of that seductive liquid whilst the gloss of newness remained upon his clothes. He would have at least one day of respectability, and he thought with inward sighings how well he could decorate *en permanence* the life upon which his resources only permitted him to linger for a few brief hours. To be always idle—always to have money at command, and to be at no employer's beck and call—these were things unattainable, but his being groaned for them. The Present, at its splendid best, bore the dim shadow of the Future.

His ideas of holiday-making were not the most brilliant in the world; but he rode about for hours on the tops of different omnibuses, and ate shrimps at lordly leisure from a brand new Turkey-red handkerchief. At certain happy moments he wondered what people took him for, and felt like a nobleman at large. In the course of time this enjoyment palled upon him. His money burned in his pocket; the gilded signs of public-houses called him with urgent, almost audible, appeal. What was a poor Tobias, with his wrecked nerves and Rum-drowned conscience, to do, even though habited in the most respectable raiment and animated by the best intentions?

The luckless money, fruit of treachery, lasted a week. The new garments found their way to the pawnshop, and the old, pocketless, frayed, white at the seams, bagged at the knees, and oily at the shoulders and elbows, once more enshrined their owner's figure. Mr Orme was not entirely devoid of grace, and was ashamed to go back to his employer. The produce of the pawned garments helped him to drag on through a week's dull repentance, and then he was without resources. He wandered about asking for work, but finding none, and was on his last legs, when somebody offered him a berth for a day or two in the capacity of broker's man. If he could have relied upon the position for a permanence, it would have come very near to his picture of the Ideal Life, and as it was, it came in as a welcome relief from thirst and hunger and the dread of downright starvation. He accepted the work with alacrity, and was at once despatched upon his business.

He was taken by his new employer, the broker, to Castle-Barfield, and there a trap being chartered, the two were driven for a mile or so along the identical route Mr Orme had travelled a little more than a fortnight earlier when he had paid his visit to Snelling. Half-way along that road the trap made a turn to the right, and then,

after a mile's drive along an umbrageous lane, pulled up before a farmhouse, passably well to do in aspect. Here they alighted; and the broker, bustling up to the gate and along the path, tapped at the open door with the crook of his walking-stick. A middle-aged woman answered the call, and a solemn child appeared in her rear.

'What do you want, master?' the woman asked.

'Two hundred and fifty-two pounds, thirteen shillings, and fivepence,' chanted the broker, 'for judgment, costs, and expenses granted in the suit of Robert Snelling *versus* Henry Day.'

'My man ain't at home, master,' the woman answered. 'Thee can come in, since thee'st got to. We've been expecting thee.'

The broker walked into the house, signalling Tobias to follow. The woman dusted a chair with her apron and drew it a little forward; then she sat down with an immovable expressionless face, and suddenly breaking into tears, threw her apron over her head and rocked herself to and fro. The solemn child ran to her, and taking one of her hands, kissed it, and stood staring with round black eyes at Tobias and his employer.

'That's the judgment, missis,' said the broker, drawing a folded paper from his pocket and opening it. 'You'd better take a look at it.' The woman drew away her apron, ceased her tears for a moment whilst she looked at the document, and then covered up her head again.—'That's a copy of the docketment,' pursued the broker, addressing Tobias, 'and that you keep.—You know your duty, I suppose? You leave the house when you're paid two hundred and fifty-two pounds, thirteen shillings, and fivepence in cash, and not before. You claim five bob for every day or part of a day you wait here, and you see that nothing is took away from the house.'

Mr Orme, fascinated by the dark eyes of the solemn child, noddled in answer, but said nothing. The function he had entered upon had a little while ago seemed altogether desirable; but now that he had actually begun with it, he thought otherwise. He was a poor creature, and good for very little, but he would never have had the heart to claim his own by any such step as this. There was not much room in him for pity; but a crying woman was a terror to him, and to keep one in company for an indefinite space of time was a disagreeable occupation.

The broker went about the house and premises as if the place belonged to him, and passed audible comments on the furniture, afflicting Tobias with a feeble sense of vicarious shame. When he had examined things to his heart's content, he went away, leaving his subordinate still fascinated by the child, who scarcely removed her eyes from his face, and seemed to regard him with a grave and understanding scrutiny which settled more and more into disapproval. It was not long before the disapproval found words. The woman had ceased to cry almost as suddenly as she had begun, and drawing her apron from her face, wiped her eyes, and began to move about the room, arranging and dusting mechanically.

'I don't like him,' said the child decisively. 'He's got a red nose. What has he got a red nose for, mother?'

'It's indigestion with some of 'em,' the mother answered; 'but with the main part it's drink.—The child's chokeful o' questions,' she added in a commonplace tone of explanation to Tobias, 'and her niver knows how to rest till her gets her answer. You musn't mind the child. You'll git used to her, maybe.—Lydia, you shouldn't ask sich questions afore strangers. What d'ye think folks'll think o' a little goll as asks questions about people's noses?'

Tobias travelled with a thoughtful forefinger over the feature thus brought in question, and cast a sidelong downward glance upon it, but said nothing. By-and-by the woman of the house produced a great roll of stocking and began to knit, with the same expressionless countenance she had worn at first, until without warning she began to cry again, and hid her head beneath her apron. This was too much for Mr Orme, who rose fretfully and walked to the doorway. A single step landed him in the garden; but he came back in a mighty flutter lest the door should be closed against him, and his possession of the house and its chattels be thereby made null and void. But finding that no notice whatever was taken of his movements, and not being bound by any very rigid sense of duty at the best of times, he pattered out again a moment later, and from that time forward made a series of timid excursions into the open air, until he became persuaded that no attempt would be made to lock him out. A swift and furtive examination of the back premises showed him that there were three separate means of ingress to the house on that side; and deciding that if need were, he could scutter back again before all of them could be closed against him, he ventured to stroll about the garden.

The weather was bright and pleasant, and not too hot. The yellow-banded bees were buzzing from flower to flower, pointing no moral of industry for Mr Orme, but fretting him with nervous fears of being stung. He went gingerly about the moss-grown paths with a constant frightened eye turned backwards to mark whether or not the feeble house garrison was preparing a barricade against him. In the course of some half-hour he gathered courage from immunity, and having lit a pipe, went ballooning along the garden paths in a state of beatific idleness. By dint of nearly half a century's pursuit of rum-and-water, his life's chief good, he had almost obliterated any original powers of thinking which nature may have bestowed upon him; but an obscured process of memory and sensation still did duty in his mind. He noticed that he was here at the instance of Mr Robert Snelling, and mused muzzily on that fact as on a strange coincidence. He began to cast his own possibilities up and down in his mind; and by dint of a good deal of thumb-and-finger counting, he arrived at the conclusion that five shillings a day represented one pound fifteen shillings per week. If that gorgeous income should endure for but a fortnight, he would be able to redeem his clothes and to enjoy at least another week's drinking. Fired by this prospect, he walked more briskly, and even dared to extend his journey to the end of the garden.

There he observed a curious thing, the significance of which he did not for a moment under-

stand. This was no particular shame to him, for a keener and more observant man than Tobias might have gone by without giving it a second thought. But there, in the far corner of the garden, the surface-earth for a rough square of some four or five yards had been dug away, and a shining black bed, irregularly quarried, lay exposed to the daylight. The shining black bed consisted obviously of coal, and Tobias's first idea was that the bankrupt household kept a queer sort of open-air coal cellar. He had neither fancy nor invention; but for once a habit of poking his nose into other people's business served him as well as either of them could have done; and after a moment's investigation, he satisfied himself that the open-air coal cellar was of mother Nature's making. In point of fact, it was neither more nor less than the cropped-up edge of a coal-seam.

An anonymous philosopher has remarked with a profundity as real as it is apparent that a good many things go to everything. It had happened, something like a year before, that Mr Orme had been employed to set up in type a pamphlet of sixteen pages octavo which dealt with the position and formation of the Great South Staffordshire Fault. Now, the Great South Staffordshire Fault is not a moral failing, but neither more nor less than a great outcrop of stone which puts an end to the Great South Staffordshire coal-field. It had been a moot-point for years amongst practical mineralogists and engineers as to whether the coal-bed were simply interrupted by this fault or actually closed in, determined and ended by it. Trial shafts had been sunk beyond it with results disastrous to the fortunes of the speculators, who had in some instances encountered live sand, and in others had sunk until they had come upon signs of the absence of coal which were regarded as final. The history of these endeavours, with certain philosophisings upon them, had made up the subject-matter of the pamphlet which Tobias's industry had helped to give to the world. He had not only put it into type with his own fingers, but, with the assistance of the office boy, had acted as his own proof reader. When the pamphlet had been sewn and cut, he had preserved a copy of it amid the archives of the ramshackle old printing office, and often in moments when work had become more than usually distasteful, he had beguiled his stolen leisure by studying its pages. So far as a knowledge of the author's views could carry him, Tobias was an authority upon this question. Once, indeed, he had discoursed with so much learning and fluency on the subject to three or four practical men whom he had found refreshing themselves in a wayside public-house in the neighbourhood of Stratford-on-Avon, as to carry astonishment and conviction to their minds, and to leave them under the impression that he was quite a shining light of science.

At first, he hardly dared to think of what the discovery of this curious hole in a farmer's back garden might mean. Even if his own crude ideas were true, and the little bared shelf of coal before him really indicated immeasurable riches, the wealth was none of his. Yet, for all that, he was staggered by his own conceptions. Here, perhaps, lay millions upon millions of pounds, and he perhaps was the first man intelligently to

discover that enormous store. Perhaps? It was almost a certainty. What should bring a man with the sheriff's bailiff in his house for a trifle of two hundred and fifty pounds, when he had such treasure as this upon his own land?

'The fool's got coal,' Tobias gasped, 'and he doesn't know it.'

He did not know how much the discovery had excited him, but he was actually beginning to perspire and tremble, when a farm labourer came lumbering down the garden path with a battered iron bucket in one hand and a pick and shovel over his shoulder. The man gave an uninterested glance at Mr Orme, and stepped into the hole, which on its shallower side was little over a foot deep, and began lazily to peck at the surface and to shovel the fragments he struck off into his bucket.

'Would you mind telling me, my friend,' said Tobias ingratiatingly, 'what that is?'

'What what is?' asked the yokel, staring up from his task.

'That—ah—that curious shiny black stuff?' said Tobias.

'Got eyes in thy head, hasn't?'

'Why, yes,' said Tobias tremulously. 'Under ordinary circumstances, my friend, I find my ocular arrangements sufficiently satisfactory. But are you sure it's coal?'

'O' course it is,' the man answered.

'Ah! Yes. Quite so. Precisely. And will it—will it burn?'

'Yo' can sit on the back kitchen fire and have a try at it.'

'Really?' said Tobias. 'Indeed? Ah, yes. Quite so. Precisely. And is it what you would call a good coal, my friend?'

'Good enough, for all I know,' the man answered.

'And will you tell me, my friend,' asked Tobias, 'how you happened to light upon it?'

'They started to dig a well a week or two ago,' answered the man. He had lazily filled his bucket, and taking it up together with his pick and shovel, he stepped out upon the garden path.

Mr Orme tremblingly intercepted him. 'Can you inform me, my friend, as to the proprietorship of the land in this neighbourhood?'

The man, to whom this query might as well have been addressed in Greek, simply stared at him and made a motion to get round him.

'No, ~~no~~ my friend,' said Tobias eagerly. 'Don't go for a minute.' He held his shaky hands out towards him, and would actually have laid them upon him, if it had not been for the man's look of ill temper and unwieldy strength.

'Is Mr Day the owner of this land? Is it his own property, his very own? Has he the right to dig into that coal?'

'It's his own land,' the man responded, 'and was his feyther's and his grandfeyther's before him.' With that he pushed by, and Tobias made no further effort to restrain him.

'The fool's got coal,' he gasped again, when the man was out of earshot, 'and he doesn't know it.'

The mystery of the Great South Staffordshire Fault was solved, and he was the discoverer. There were millions below his feet, millions, millions! His head began to whirl, and his hands shook as if he had been smitten with

a palsy. His knees were loosened beneath him, inasmuch that he found it necessary to sit down on an old disused beehive near at hand. His bemused mind seemed to grope in its own recesses with a blind and greedy avarice. Was there nothing for him in all this?—no means of enriching himself? He was an old man—he was getting to be very old. He had to work for a living, and there was nothing before him but the workhouse: a cold and cheerless habitation for one who, like himself, had cultivated a lifelong fondness for rum and society. There were tears of senile pity in his eyes for the poor old man who had to work for his living. He had always felt that to be hard, but he had never felt it to be so hard as now. Millions upon millions, and he to have found them, and still to be poor! He tugged at the ring of gray hair which surrounded his baldness in a frenzy of impotent desire, and then all on a sudden became aware that he was feeling very sick and cold, in spite of the warm summer sunshine which poured upon him. He got up and staggered along the path towards the house with his feeble knees still trembling and his face all blanched, except for one rubicund spot upon his nose, which on this novel background stuck fiery off indeed. The woman of the house cried out at him as he entered at the doorway.

'Lauks-a-mercy! what's the matter with the man?'

'I am unwell, ma'am,' sobbed Tobias; and indeed the ghastly pallor of his face and the cold sweat which had gathered on his forehead gave warrant to the statement. 'A little brandy, a little rum—anything.' He clasped his stomach pitifully with both hands, and stared appealingly at her with his features twitching.

The woman without a word ran to a cupboard, and laying hold of a great stone jar, poured out a glass of whisky.

Tobias seized it greedily and emptied it. The colour flowed back to his face, and heaving a tremulous sigh, he set the glass upon the table.

'What is it, master?' the woman asked him, kindly enough. 'Bee'st better? You looked like death a minute ago.'

'Thank you, ma'am,' he answered; 'I am a little better. I am subject to that kind of attack. A malady contracted in early youth, almost in infancy.'

'It is to be hoped it does not come on often,' the woman answered.

'It does not frequently happen,' said Tobias, 'that the attack is so serious as it was upon this occasion.'

He was beginning to feel like himself again, and there was a new illumination in his mind. It was at Snelling's instance that he was here, and Snelling was a man of capital. He had a hold already on the owner of the land, and he would give fifty pounds to know this news. Fifty? He would give a hundred. Tobias sat quite dazzled by this sudden prospect of wealth; but by-and-by his mental eye grew used to it. The capitalist who knew of his discovery first of all could make a gigantic fortune, and a hundred pounds was a poor recompense for the original finder. His thoughts swept on to two, three, four, five, and the mental barque almost came to shipwreck when it struck a thousand.

The woman of the house having cast two or three inquiring glances at him, being moved thereto by his wild looks and an occasional moan or muttered exclamation, withdrew from the room in pursuit of some household duty, taking the child with her. Moving on tiptoe, Tobias made a stealthy raid upon the whisky jar. His nerves wanted steadying; he must give himself the power to think. He filled the tumbler almost to the brim with the real spirit, and gulped it down in a thievish haste and fear lest he should be discovered. The potent drink brought tears to his eyes and set him coughing; but it seemed to fill his blood with refulgent colour, and to strike a thousand bright and victorious fancies into his mind. He was his own man again, and more. The potentialities of wealth inspired him. In all his sordid shabby life he had known no moment of exultation comparable to this. His thoughts soared fearlessly. He would claim a partnership. The sense of power and triumph grew unbearable, and he felt that he must put his project into instant execution.

He marched, erect and vigorous, from the house and into the road, and there a momentary confusion seized him. He was not quite certain of the direction of Snelling's house, but he had never felt so prompt and daring. It almost seemed to him that whichever way he took it could not fail to lead him to his destination. He struck out courageously, and walked on encircled by radiant dreams. But he had drawn his inspiration from a treacherous fountain, and was in a while stupidly surprised to discover that whilst the radiance remained, the reason had vanished from his mind. That was all right, however. Everything would have been all right if the summer sun had been a little less powerful.

ROCK-PICTURES.

PAINTED or engraved rocks occur to puzzle the antiquary in every quarter of the globe. They are found in Siberia, in Africa, in Australia, in our own Northumberland. The most curious and interesting pictured rocks are, however, to be found in Mexico and South America. Those of Mexico have been described so fully and so often, in their connection with the history of the civilisation of that country, that it is unnecessary to do more than refer to them here. In South America, however, especially in British Guiana, very curious and striking specimens of this rude art, which are not so well known, are to be found. Various explanations of them have been given. After a very careful investigation of the subject, Richard Andree, in his work entitled *Ethnographische Parallelen und Vergleiche*, comes to the conclusion that they were the work of idle moments and bear no meaning whatever. Other travellers and writers on the subject disagree entirely with him. It will be best to give some account of the specimens of rock-pictures now found in Guiana and the Amazons, in order to see what may be inferred from them concerning their origin.

There are two kinds of pictured rocks—the painted and the engraved. The former do not deserve much consideration. The painting upon them is done in a red pigment used by the

Indians for personal adornment, and as this pigment is not able to withstand the wear and tear of the elements for any considerable time, these paintings are probably of comparatively recent date. The rock-engravings, on the contrary, belong chiefly to a date antecedent to the European invasion of South America. They are divided into two classes—the deep and the shallow engravings. The deep engravings have apparently been cut in the rock by some sharp stone instrument, similar to the implements in use in the Stone Age. The shallow, which are only from one-eighth to one-half of an inch in depth, are mere scratchings. It is supposed that they were produced by rubbing with loose stones or wet sand. As a rule, the deep engravings are not found in the same districts with the shallow. They are apparently the work of a different people and a different age.

The most remarkable of the shallow engravings occurs on the Corentyn River below the Wanitoba cataracts in Guiana. The rock on which it is pictured is called the Temehri rock, from a Carib word signifying painted or marked. This representation is remarkable on account of its dimensions, for the same figure occurs repeatedly in the shallow engravings. It is a long rectangular figure, with a pattern of lines crossing with geometrical exactitude from side to side. It lies on the slope of a rock with a very smooth surface, and it is thirteen feet long by five feet seven inches in width. Above this oblong figure is depicted a semicircle marked out in two lines, with distinct radiating lines filling up the curve of the semicircle. As is usual with these shallow engravings, the marking is very indistinct; under certain lights it is impossible to discern the form clearly until water has been poured over it. In photographing this engraving it was necessary, first, to trace it out with white chalk. Another curious figure occurring a little lower down on the same river is an upright line with several volutes springing from it on either side. Forms of this description occur repeatedly. They are for the most part very indistinct; sometimes only the trained eye of the Indian can spy them. One feature in these engravings which can hardly be without some significance is that they always face east.

The deep engravings are far more varied in character. The artists have depicted, roughly enough, it is true, but unmistakably, men, monkeys, snakes, sometimes alligators, lizards, beetles, as well as combinations of curved lines. These combinations are often most elaborate. The so-called 'Greek' pattern is also found. The attempts to depict living creatures are odd enough; they bear a remarkable likeness to the early attempts at art found to-day in Old World nurseries and schoolrooms. Thus, a straight line represents the body; transverse lines at right angles to this serve for the upper parts of the arms and legs, as far as the elbows and the knees. Ascending lines mark the rest of the arms with fingers branching outwards; descending ones with radiating toes depict the legs below the knee. A heavy dot represents the head. In the case of monkeys, another line was added for the tail. Two drawings of far more elaborate design are described by Sir Robert Schomburgk. One of these is a wondrous combination of lines

wrought into a pattern that might serve for architectural ornament, or, diminished, would be most effective in embroidery. The other is far more interesting to us. It is a drawing of a large ship of European build, with a smaller one above. It was discovered on the Rio Negro. Rough as it is, it clearly represents a Spanish galleon of the time of Columbus or his immediate successors; and the drawing appears naturally enough to be connected with a famous incident in the history of the Spanish exploration of South America. Francisco Orellana, the first European to advance beyond the mouth of the Amazons, found himself in need of a vessel by means of which he could descend the main stream and gain the Atlantic. Undeterred by the difficulties that lay in his path, he set to work to build himself a ship. This daring enterprise he carried out successfully, and surrounded by the Indians who accompanied him on his journey, he built his ship in the middle of the great South American continent in 1540. Is it unreasonable to suppose that on their return home the Indians should have chronicled the astonishing event in their rude fashion, or, perhaps, have attempted by this representation to show their friends at home the shape of the strange vessel built by the white man?

The question of the origin and intention of the rock engravings now presents itself. So far, no satisfactory answer to it has been found. The Indian, when questioned invent half-a-dozen replies quite unworthy of attention. It is a characteristic of the Indians that they will never acknowledge their own ignorance. They always make up an answer to every question. Some will tell you with supreme indifference that the women made them; others declare that they were done by Makenaima Moomoo (the Son of God) when He was on earth—a reply suggested clearly enough by the Gospel story of the early missionaries to South America. André's idea, the result of careful thought and comparison, that they were idle scribbling, is rejected by other explorers for reasons sufficiently sound. In the first place, they are often high up in almost inaccessible positions. Then, they could only be accomplished after patient and wearisome toil; and those who know the Indians well think it unlikely that they would work thus without a purpose. Moreover, the figure found on the Temehri rock, and constantly occurring among the shallow engravings, is very much like a design noticeable in the Mexican pictures.

It has been suggested, and with a fair show of reason, that these pictures have often been made to commemorate some event in the history of the Indians, and as they are frequently found above cataracts, it is not unlikely that they often are, as it were, memorial or biographical inscriptions. Near Lake Superior, an example of picture-writing occurs, which, though far more easy of interpretation to the uninitiated than those of the South American rocks, is doubtless of the same nature. On this rock are depicted five canoes, containing fifty-one men, a kingfisher, a man on horseback, a land-tortoise, and a figure made up of three circles arched over by three semicircles. The reading of this is simple enough: Fifty-one men went on an expedition in five canoes; their leader rode; his ally bore the

name of Kingfisher; in three days—shown by the heavens arching above the circular suns—they reached land—signified by the tortoise. Whether there is a further connection with religious observances is uncertain. One of the few superstitious rites practised by the Indians—that of rubbing the eyes with the juice of red pepper—is performed before the engraved rocks. A key to the mystery—if it be a mystery, to which view of the matter André would not give in—may yet be found. No such art is practised to-day among the Indians of Guiana.

NABOTH'S VINEYARD.

BY FRED M. WHITE.

IN FOUR CHAPTERS.—CHAP. I.

'But it is such a pretty scheme, Heath. The place has been my envy for years; and now to let such an opportunity go by would be almost like flying in the face of Providence.'

Colonel Sandhurst spoke very warmly; in a way, indeed, which was quite a contrast to his usual calm judicious utterance. He had his long neatly clad limbs planted very widely apart before the fireplace of Mr Heath's private office; while the latter gentleman sat at a desk stabbing a blotting-pad with a penknife, as if he were slaughtering his client's arguments as they cropped up, hydra-headed, before this legal Hercules.

'It is a pretty scheme,' said he, with a certain dry irritation. 'I've seen plenty of them in my time—mostly failures. And I don't mind telling you in all candour that I hope this will be one.—Why can't you leave Mrs Charlesworth alone? Here you have one of the most beautiful places in Sussex, a handsome almost princely income to keep it up, and yet nothing but the possession of Fernleigh will content you.'

'But don't you see there is no house on my property down here?—three thousand acres in a ring fence with Fernleigh and its five hundred right in the centre. It seems very hard'—

'It is a great deal harder for my poor client, Mrs Charlesworth, to turn out of her old home.—Oh! of course as mortgagee you have a perfect right to foreclose, and I am a great fool to allow sentiment in business.'

'But if the woman can't afford to live there, what right has she to stay?'

'Cannot you understand that if this long-delayed Chancery business was concluded, she would have ample means? I wish you would abandon this plan, Sandhurst; I do indeed. If you only knew how attached the poor little woman is to her home; how happy she is there with her daughter, and her blind boy—there, hang it, you couldn't do it! Of course I am a weak-minded old man, but'—

The Colonel pulled his long moustaches in some perturbation of spirit. Usually speaking, he was a kind-hearted individual enough, and really felt very sorry for Mrs Charlesworth's unmerited misfortunes. But at the same time it is very annoying, as most landed proprietors know, to have a long stretch of some one else's property exactly

in the centre of your own. And, moreover, the Bartonsham estate was celebrated for its preserves, while the unhappy owner of Fernleigh had no sympathy with the pursuit of either foxes or pheasants. Colonel Sandhurst had no personal antipathy to his neighbour; nevertheless, when an opportunity offered for a heavy mortgage, he jumped at the chance. And now that more than two years' interest was in arrear, and the Colonel in a position to foreclose at any moment, the temptation was too strong to be resisted.

'I do not see why I should drag a lot of sentiment into the matter,' he said reflectively. 'Of course I am very sorry, and all that kind of thing; but if I don't have it, some one else will, you see.'

'I am afraid so,' the lawyer groaned parenthetically. 'I see that plainly enough.'

'Very well, then. Again, if it comes to a sale, I shall probably be run up to a fancy sum by one or more of the lady's friends.—Come, I will make you a proposition. My mortgage is for seven thousand five hundred, and for this the property is legally mine. But I don't want to appear grasping. Suppose we call it a sale, and I give you another two thousand five hundred for your client. I call that a fairly generous offer.'

Mr Heath dug his knife three times in rapid succession into the blotting-pad and dropped it with a sigh of defeat. Of course it was a generous offer, an extremely generous offer, and yet beyond the folded blue papers and red tape and tin boxes, there was before his mind's eye a picture framed by a long avenue of ancient fruit-trees: the vision of a gentle-faced little lady with a blind lad leaning on her arm, and the last words she had said to him were ringing in his ears now. They were such simple words, too: 'If I lose this,' she had said with a wistful glance, 'I lose all hope—not for myself, but for the children.'

'I should like to refuse it,' observed the lawyer. 'I should like, metaphorically speaking, to throw your mortgage in your face and snap my fingers at your legal rights. It all comes of this atrocious sentiment; and the worst of it is that your offer is so magnificent, that, speaking as a man of business, I dare not refuse it; only you must give us a week to think it over.'

Colonel Sandhurst smiled benignly, and expanded, as a man will who is conscious of having done a generous action. 'Fernleigh is a beautiful old house,' he observed complacently, 'and will be the very place for Frank and his bride. The old soldiers are pretty tough in a general way; but hard service begins to tell after fifty, and I should like to see my boy settled before long. Ethel Morton is an extremely nice girl, and will make the lad a good wife.'

'Provided always, as we say, that the lad is willing. I wouldn't set my heart too firmly upon that match, if I were you, Colonel. Captain Frank is no longer a boy, to be commanded into matrimony.'

'He was always a very obedient son, though; and by Jove, sir, one to be proud of. Of course you heard all about that Victoria Cross and the fearful wound he received; but he will be here next week to answer for himself. In his last letter he says that the six months at Madeira have quite set him up again. If anything had happened to him'—Here the speaker paused

and hummed a fragment of operatic music with a great show of palpably assumed gaiety; while Mr Heath looked out across Castleford's principal street, deeply interested in the facetious conversation of two cabmen in the sunny sleepy square below.

'Would you like to go over Fernleigh?' he asked suddenly, his mind still dwelling uneasily on the old topic. 'It would ease my client's mind to know that she is not in the hands of an investment-seeking ogre; and, as a matter of fact, I don't believe she knows the name of her principal creditor.—What do you say to running over one day this week?'

'Well, I don't know,' said the gallant warrior hesitatingly; 'it seems almost like an intrusion, and in anything but the best taste. You see I'—

'Yes, I see you haven't pluck enough to face Mrs Charlesworth. But, as you are bound to meet some time, the sooner the better. I am going out there this afternoon, and will mention it.'

The Colonel nodded slightly with a perplexed smile on his lips, but he did not answer, for the simple reason that Mr Heath was right. There was a momentary silence between them, in which the humorous conversation of the cabmen could be distinctly heard.

'I mean to remain in the neighbourhood till this matter is settled one way or another,' replied the ex-dragon at length; 'and Frank will probably join me at the *Green Dragon* later on. And if it is a question of another thousand you will not find me obdurate.' With this parting magnificence the colonel extended his neatly gloved hand, and took his way down the dark stairs, and thence into the High Town with the air of a man who has discharged a delicate commission in an eminently praiseworthy fashion.

But if he felt on such excellent terms with himself, not so Mr Heath. The worthy solicitor was fain to own himself beaten, and handsomely beaten at that, for it is really hard to quarrel with a man who insists upon making a total stranger a present of such a good round sum as three thousand and some odd hundreds of pounds.

Mr Heath felt genuinely sorry for his old friend and client, Mrs Charlesworth; a sympathy none the less keen because at one time, many years ago, there had been the dream of a home over which Margaret Hay was to have held the undisputed sway and sovereignty. As the practical business man gazed out through the grimy windows, memory was very busy with him, jumbled up strangely with business instincts and vague shadowy plans for Margaret Charlesworth's welfare. The old bachelor's heart was still green enough to realise the poignant sorrow which the loss of her home would be to the only woman who had ever caused his pulses to beat the faster. And as he drove along the deep country lanes an hour later, he seemed more strongly to realise what a wrench it would be. In the valley, lay Fernleigh, its twisted chimney stacks above the belt of immemorial elms, where the rooks were busy, and doves crooned in the peaceful silence of the afternoon. But a stone's-throw down the road between high hedges, where violet and foxglove and dogroses were blooming, were the

gates, moss-grown and rusted, but still beautiful, for they had come from the foundry of Quintin Matsys, carried hither more than two hundred years ago by some art-loving Hay, who had followed the profession of the sword, as gentlemen did in those days. Beyond the gates lay a short circular sweep leading to the house, a gray stone building with pointed gables richly carved with birds and flowers, as one sees them occasionally in districts where the soldiers of the Commonwealth failed to penetrate; while on either side of the smoothly shaven lawn, with its spreading copper beeches, was a sloping bank topped by a thick laurel hedge, beyond which lay the gardens, each enclosed by high stone walls.

And if Mrs Charlesworth loved one part of her fair domain better than another, it was the garden. There appeared to be no serious attempt at order, as one sees in such places nowadays, for the mossy paths were overgrown with eglantine and tulip and York roses, shaded by espaliers and arched bowers of the filbert and golden pippin, with just enough neatness in its elegant disorder to show the hand of care. There was a fragrance in the air, a scent of sweet brier and lavender, mingled with mignonette half hidden under the fallen petals of the apple blossom. The same now as it might have been a century since; the same as its sorrowing mistress first remembered it, when as a tiny child she rode on her father's shoulder and plucked the sunny peaches on the ripe south wall; the same as when her whitening hair was a tangled net of gold and her violet eyes stirred sleeping hearts in vain. For Fernleigh had been her own home before Vivian Charlesworth had distanced all rivals and won the heart of Margaret Hay; a place to see and love, but a place to leave with lingering and regret.

Mr Heath walked his horse along the drive, under the shadow of an arching belt of chestnuts in the full glory of leaf and flower, past the open hall door with a cool dim vision of polished oak and blue china beyond. In the green court, wall-flowers flourished on the stone buttresses, there were ferns on the stable roof amongst the stone-crop and celandine. There was no helper in the yard, so the visitor put up his own horse, and having done so, mounted a short flight of steps, and pushing back a little rustic gate under two cropped yew-trees, entered the garden. Walking there under the apple boughs was the mistress of Fernleigh, a book in her hand, the other resting on the shoulder of a boy some twelve years of age.

There were gray lines in the soft bright hair under the white lace cap, a subdued sadness in the fair face, otherwise untouched by the ruffling hand of time; and yet a pleasant beautiful face, for beauty at fifty is something we like to gaze upon again. As she looked up, her eyes fell upon Heath with a pleased smile of welcome. 'This is very good of you,' she said. 'You guessed where we should be found. I thought Vivian had had enough music, so we came out here, and brought *Vanity Fair* with us.'

'Which character do you like best, Mr Heath?' asked the boy eagerly. 'George Osborne or Major Dobbin? We prefer the Major.'

'Being unpractical people, naturally,' answered the lawyer. 'Perhaps I have a sneaking affection for him myself; though, professionally speaking,

I dare not say so openly.—So that is the last hero, Vivian?'

Vivian turned his wide blue eyes in the speaker's direction—those sightless eyes, that seemed, none the less, to read the very soul of those they encountered—and a slightly puzzled expression crept into his face. 'Why cannot you say what you think?' he asked.

'Because we do not dwell in the palace of Truth, my child.—And now, run away to your music while I talk business with the mother, though it does seem a sin to bring red tape into this pure atmosphere.'

The boy walked slowly away down the path, touching a leafy spray here and there with outstretched fingers. For a moment they both stood watching him; the one tenderly, almost yearningly, the other with a shade of sadness and pity in his honest gray eyes.

'John,' exclaimed Mrs Charlesworth, suddenly turning to her companion, 'if it were not for him the parting would not be so keen.'

'Keen enough to break your heart,' returned the lawyer gruffly. 'You cannot yet realise it, Margaret. I know your feelings, perhaps better than you comprehend them yourself. When you love every inch of the ground'—

'I do—that is true enough. And the thought of it all keeps me awake at night; it haunts me as I walk here by day. Cannot you understand what it is to love every tree and leaf and flower—to have a tender association or wistful memory attached to each single foot of soil? There is everlasting youth for me here, but still'—

John Heath at this moment was seized with a sudden fit of coughing, a circumstance which perhaps accounted for the unusual dimness in his eyes. Conscious of some feeling of inherent weakness, he became more dry and business-like than usual; his habit when touched. 'If this wonderful memory of yours would enable you to remember where your grandfather hid that precious assignment, it would be the better for all parties concerned. Allowing that the deed cannot be found, Mrs Morton takes the whole of the funded property. But if we can only discover it, the fifty thousand pounds at present invested in consols goes to you, and the Kingswell estates besides.'

'It never will be found; indeed, I almost doubt if it was ever executed,' said Mrs Charlesworth wearily. 'It is all so strange and puzzling.'

'Not at all. When you married your cousin, Vivian Charlesworth, who was a great scoundrel, if I am any judge?'

'John, he was my husband, and he is dead.'

'And a good thing too,' exclaimed the lawyer hotly.—'Well, you know how angry your grandfather, Martin Hay, was about that, though you were his favourite grandchild. By his will he left everything to your cousin Mary, who afterwards married Wilfred Morton. Of course you remember how the old gentleman used to boast that he never altered his mind; and when his feelings changed towards you, he refused to make a new will. But by deed he assigned to you the income arising from the London property, and the Kingswell estates. There is no doubt whatever about that. The assignment was given into the custody of your father, and held by him up

to the time of his death. And it is my opinion that when Vivian Charlesworth got hold of the title-deeds to this place and tried to raise money on them (as he did), he must have found it somewhere, and laid it aside for future use.'

Mrs Charlesworth followed this story with a vague idea as to her legal adviser's meaning. Then, with some faint show of interest, she inquired if Heath knew anything of this unknown relative who seemed determined to take the full measure of her legal rights.

'All I know is that she is young, and is, moreover, being well advised—that is, from a purely business point of view. You see they have everything on their side, and plenty of money to prosecute the suit. If they refuse to accept my offer of a compromise, Fernleigh must go.'

The listener caught the full significance of these last words, and her breath came a little more quickly. She looked up at the blue sky above the apple blooms, and away down the dim green avenue to the house beyond. How bitterly hard it seemed, doubly hard standing there in the full fresh beauty of the summer afternoon, hallowed by the sweet recollection of a thousand such, a maze of pleasant memory, back to the dim remembrance of childhood.

John Heath waited to allow the whole force of the declaration to strike home before he resumed again. 'Believe me it is best to tell you this plainly, though it is painful enough to me. I have had a long talk with your mortgagee this afternoon, and he has made what I consider to be a handsome offer. Of course he can take the whole place as it stands at any moment; but he will do better than that: he will buy the place for three thousand five hundred over his claim.'

'That is very generous,' said Mrs Charlesworth with an unsteady smile. 'Would not that sum invested at five per cent. bring us in a hundred and seventy-five pounds a year? Three people can live on that.'

'A great many people live on less. And besides, if I am any judge of Miss Gladys' character, she will be no weight on your hands. —Margaret, you are singularly blessed in your daughter.'

'I am blessed in both my children, John. Now I suppose you will want to bring my generous creditor over here soon? I wish I could feel sufficiently grateful, but I am rebellious as yet. And if you can forget business for a time, perhaps a cup of tea'—

'Not this afternoon, thank you; I must be in Castleford by six. I will let you know when the colonel is coming.'

They walked down the garden path side by side; and as Heath brought his trap round, Vivian stole from the house to his mother's side. He seemed by some subtle instinct to feel her presence near him, as he could tell the footsteps of those he loved. 'Mother, are you unhappy?' he asked.

'I, dear? Why should you think that?'
'I don't know; perhaps it was my fancy. Some way, it seems lately that you and Gladys are so much quieter after Mr Heath comes.'

Any reply was prevented by the sound of the lawyer's approaching carriage wheels. They walked by his side to the gates, and afterwards

stood for a long while watching him as he drove away. Presently, Vivian lifted his hand, and laid it gently on his mother's cheek. 'You feel happier than you did, mother?' he said.

Mrs Charlesworth turned from the contemplation of the peaceful landscape, and bending over the boy, kissed his brow tenderly. 'Much happier, Vivian, almost quite,' she replied, and as she said these words, the tears lay on her cheek unseen.

ERRONEOUS PRACTICES.

ARISTOTLE characterised man as an imitative animal, and there is no doubt that an involuntary tendency to imitate forms part of the human constitution. We are also told that imitation is the sincerest form of flattery, and so it is when we diversify what we copy so as to improve upon it—otherwise there would be no progress—not when taken in its literal sense of mere servile following, as in yawning, for example, which we do simply because we see or hear somebody else doing so. 'Follow my leader' is an excellent game so long as the fogleman knows what he is about; otherwise, it may lead to a series of deplorable mishaps and disasters, and where those in the rear follow blindly, we invariably find that 'one fool makes many.' Applying this school-boys' game to the more serious walks of life, certain erroneous practices are perpetuated day after day, year after year, by successive generations of so-called rational beings, for the simple reason that they are content to tread with their eyes shut in the footprints of those who have gone before. Let us give a few examples of this blind discipleship, and see where they land us.

Why is it that in our places of divine worship alone the speaker continues to be placed at an elevation above his audience? We can understand this having been done in the old days, from mistaken notions, and when the study of acoustics was in its infancy; but since we now know that the loudness or intensity of sound depends upon the density of the medium in which it is produced, not upon that in which it is heard, and that the density of the air in a building decreases as we ascend from floor to roof, there is no longer any excuse for such a misapplication of science. The old three-decker of our grandfathers is certainly, except in a few village churches, a thing of the past; but the remedy is as yet only half complete. We pointed out, in the *Journal* for December 11, 1886, that this speaking from a height, with the head lowered, had been ascertained to be the cause of clergyman's sore throat, and compared the case with that of a barrister addressing the judge and jury seated above him. But we are a conservative race, and require oft-repeated admonition before we can make up our mind to relinquish any old custom, be it ever so baneful and injurious.

The popular custom of pouring spirits into the boots, with a view to prevent the effects of cold, was the cause, in 1807, of the death of Alderman Hankey. Feeling his feet damp and cold, he was induced to pour a glass of brandy into his shoes, in which state he walked home; and shortly after his arrival he was seized with inflammation of the bowels, which in a few hours proved fatal. This practice supposes the internal and external application of spirits to produce the same effect; but

a little consideration will show that whereas the former excites general warmth and restores the circulation in the extremities, the latter has an opposite result. Evaporation produces cold, and the lighter or more spirituous the fluid, the more quickly does it evaporate, and the greater is the degree of cold generated. This can be demonstrated by wetting one hand with spirit, the other with water, and holding them up to dry, when that covered with the spirit will feel infinitely colder than the other. Or the bulbs of two thermometers may be similarly treated. This practice greatly enhances the danger arising from wet feet; and if spirits are to be employed as a remedy, they ought to be taken internally. We might with quite as much reason take a table-spoonful of mustard, instead of applying it externally in the form of a poultice.

The writer nearly lost his life through the practice, obtaining in some houses, of turning off the gas at the meter when the household retires to rest. Knowing that the gas supply would shortly be cut off, on reaching his bedroom he lit the candles, leaving the gas jet alight, whose subsequent extinction escaped his notice, so that he omitted to shut it off. On waking next morning he found the room almost filled to suffocation with gas, the servants having turned it on again at the meter when they went down. Had he not been in the habit of sleeping with the window open, he would not, in all probability, have survived to sound this note of warning. That this is not a solitary experience, the following extract from the *Times* of January 1883 proves: 'Mr Hyman, a monetary agent, residing in Belgrave Road, Birmingham, retired to rest on Thursday evening somewhat earlier than usual, leaving a gas jet burning in his room. Some time afterwards the servant turned the gas off at the meter, according to the custom of the house. In the morning the servant, as usual, turned the gas on at the meter, when it of course escaped through the open jet into Mr Hyman's bedroom. About half-past eight the family were startled by hearing groans proceeding from the bedroom; and on hastening to Mr Hyman's assistance, they found him lying on the bed in an unconscious state, with the room filled to suffocation with gas. Medical assistance was at once procured; but in spite of all efforts, death resulted in less than half an hour.'

The arguments adduced on the other side—namely, economy and the improbable danger that would accrue from the falling of a gas chandelier—hardly weigh against the risk to human life.

One bitter cold day last winter, a lady, accompanied by her little boy, was making a friendly call upon a medical man; and on entering the warm drawing-room told her son—as most mothers would, from their having been similarly admonished when children—to take off his overcoat, or he would not feel the benefit of it when he went out again. 'Excuse me,' interposed her host; 'but that is a mistaken idea. Let the little fellow keep it on, and get all the warmth he can into his body; for if he start off with a good stock of warmth, he will remain warm.'

We are not prepared to offer an opinion one way or another on this point, but can affirm that ever since that visit the doctor's advice has been

followed in that family, and that no ill effects have resulted. When we indulge in the luxury of a warming-pan for our bed, or place our boots in front of the fire before starting out on a frosty morning, we are carrying this theory into practice, having learnt by experience how much easier it is to keep warm than to get warm, especially if our circulation be at all sluggish.

These few examples suffice to illustrate the doctrine that we desire to inculcate—namely, how necessary it is in even the simplest matters of every-day life to exercise the reason with which we are gifted, and to do nothing, however trivial, without pausing to consider and ask ourselves whether there be no better way of doing it; thus endeavouring always to act up to Ward Beecher's estimable counsel: 'The philosophy of one century is the common-sense of the next. We should so live and labour in our time, that what came to us as seed may go to the next generation as blossom, and that what came to us as blossom may go to them as fruit. This is progress.'

IN A WELSH COPPER MINE.

'Have you ever been into a copper mine?'

'No.'

'Well, I am going down to report upon one in Wales; so, if you care to go with me, be at Euston to-night for the ten train.'

The opportunity of accompanying such a mining expert as my friend X, whose knowledge of lodes and veins has been gained by a study of nearly every important mine in both the Old and New Worlds, was too good to be lost; and so I took my seat in one of the carriages which formed part of the auxiliary Scotch mail at the hour appointed, bound for a little station amongst the Cambrian hills, whose name appeared on the tickets which were to frank us thither, as a string of consonants seemingly chosen from the alphabet in a broadly catholic spirit.

A blowing of whistles, a waving of green lights, a hissing puff, a slight jerk, and the mail is under way, and gliding out into the dusky summer night. Faster and faster is the pace; a rattle, a roar, and a flash of brightness as suburban stations shoot by—a moment's pause at Willesden, and then a brave run to Rugby. But that classic town, sacred to the memory of a noble name, and dear to all lovers of plucky, sturly Tom Brown, is hidden in Stygian blackness, so on for Stafford.

'Change here, gen'elmen, for Wyllynttrwch.'

A dismal post-midnight prowl about a semi-dark bleak platform for an hour is not calculated to impress drowsy travellers favourably with this important railway centre; and its long array of signal-lights is cheerfully lost sight of as the locomotive 'Actaon' steams past them for Shrewsbury. A faint grayness is showing in the eastern horizon, and the Severn gleams cold under the hint of day-dawn; but the quaint town slumbers on as we crawl away from its silent shadows, and gathering speed, rush swiftly Westward ho.

Again that dolorous cry, 'All change;' and we rouse ourselves, and turn out for half an hour's wait at another junction. But the night has gone now, and day is driving rejoicingly along the steel-blue heavens; and a lovely panorama of swelling hills, of wooded knolls, and rolling

pastures, is around, from which white wisps of mist curl up and ascend—as incense to the rising sun; whilst birds begin to chant their morning madrigals, and the scent of the hay is strong on the sweet fresh air. Now, indeed, the journey is thoroughly enjoyable as ‘the Local’ winds its way along the twisting valley, crossing and re-crossing its brawling stream, with many a dive through gloomy cutting and tunnel, and pausing at each tiny roadside station, at one of which two of its passengers at last joyfully alight.

For real appreciation of the memory of those old Romans who introduced the bath into these islands, commend me to the morning tub after an all-night railway journey, whilst the fragrance of frying salmon steaks ascends from the kitchen below, as the crystal water leaps and trickles from the useful sponge. Sure, never is dressing such a pleasure as when fresh linen is donned, and you hasten to breakfast after a two hundred miles’ dusty, sleepy run over steel rails.

‘Is the luncheon aboard, Morgan?’

‘Oh yes, sir; he’s all right.’

‘Very well, then; off you go!’

The little round-shouldered Jehu shouts something in an unknown tongue, shakes his reins, waves a decaying whip, and the wagonette rolls away up the village street.

Once beyond the gray-slatted houses, the road begins to ascend, and we soon wind past the wooded park of the Squire’s lovely place, and come out on to the bare wild moorland. Here a thick-set cart-horse is waiting in charge of a round-faced boy, who has deemed traces or chains a superfluity for draught purposes, thus necessitating a halt, whilst the mine-captain who accompanies us, a general factotum yeleft Samson, and our Jehu, after much difference of opinion, rig up an arrangement of ropes by which ‘Bessie’ is finally moored as leader to the team. Stiff collar-work and no mistake, under a hot sun, and we do not push the poor beasts, but frequently stop to ‘let ‘em wind.’

At a dip in the road where it crosses a narrow dingle or green hollow, there is much shouting in their native tongue between Jehu and the boy who is riding postillion, which ends by the latter ‘voiding his *selle*,’ as the old romancers term the act of dismounting, and the former explaining, ‘He say he won’t ride ‘e mare no furdur, for she sweateth so he’s gotten wet to his legs.’

The aneroid shows a rise already of twelve hundred feet, and we have yet that peak ahead to cross, so whip and shouts go to work again.

Close on our right, beyond a wire-fence, is a long deep cutting like a narrow quarry, where our guide tells us much lead was got some fifty years ago. On the opposite side of the road the ground falls away steeply, and goes sheer down some five or six hundred feet to a narrow valley, whose further side is pierced by the tunnels or adits and the shaft of a disused mine, whilst a crushing-mill and silent water-wheel stand melancholy beside a noisy streamlet just below.

‘You see lead is so low-priced, they have stopped working these years past,’ says the mine-captain.

‘Probably, they did not know how to get the silver out thoroughly and economically—the cause of loss in many a lead mine,’ opines the engineer.

‘Whoa then, mare—we be at top o’ t’ ridge

here;’ and Jehu claps on his brake with much bustle and contortion of limbs.

Whilst Samson shoulders the provisions and a stone jar, and the captain argues and arranges with the driver as to a place of meeting, we gaze at the magnificent view around. Away to northward, Cadair Idris (the giant’s chair) cuts the skyline with a range of lesser maguates on either flank; and between, a deep green valley, where the salmon-river gleams like a twisted cord of silver; then hillocks rising into hills, which raise their heathered crests to our very feet. Behind us, a dipping expanse of moor, where a little lakelet reflects the sailing clouds; and beyond, more mountain peaks. To right, the moorland rises in a billowy ridge to break out of sight in lessening heights across the English border. To left is a deep narrow gorge like a great rift in the hillside, where a torrent plunges and foams in many a cascade to the narrow valley a thousand feet below, where the pine-woods wave a welcome to its glittering waters.

‘This is the way, gentlemen.’

We step off the heather, and follow him over the edge of the ravine, stepping carefully down the loose stones and shingle of a path which is cut zigzag fashion down the face of the precipice, until we reach a platform where the rock-wall curves back a yard or so above the stream. In this cliff is an opening like a tunnel; and a shrill whistle brings out of it two stalwart miners, brown and muddy, for we have reached the mine, and this is adit No. 1.

Whilst we are drawing on great boots which come up to the knee, and donning canvas overalls, the engineer is quickly and carefully noting the direction of the strata and opposite face of the ravine, putting questions now and again to the miner beside him. Then, having got his dial, measure, and other gear, he leads off up the adit, and we follow, each with a candle gripped in a ball of clay. Water is dropping from the roof and sides of the gallery, and flowing in a muddy stream ankle-deep over the floor; and touching here and there the slimy walls, a deep brown mud stains our jackets.

‘This be the first lode;’ and the miner points to a dark-green band some six feet long which crops out in the rock.

The engineer examines it, and passes on to where a hollow overhead is filled with timber, and remarks: ‘That’s stouped.’

‘Yes; we’ve got some fine stuff fra there,’ rejoins the guide; and we proceed.

‘Here’s the winze!’ He stands on one side; lowering his candle, tells us where to step, so as to avoid falling into a pit eighteen feet deep which has been sunk in the floor of the adit after the lode. This is now full of water; and an amused smile passes over X’s face in the yellow candle-light as he hears how there is a splendid vein of copper there, and answers:

‘I have often noticed in mines I am asked to report on that the finest lodes are always where I cannot get at them: they are usually under water.’

Another belt of greenish rock-brings us to the end of the drift, and we return to daylight.

‘Well, gentlemen, I don’t think it is much good going into any of the other workings. I can see exactly what the mine is.’

However, in response to entreaties, we make our way to adit No. 2, and penetrate into its chilly recesses and examine the spot where another lode is about to crop out. This is but three feet in width at most, and varies from a foot in thickness to a few inches at either end—or, as miners term it, it 'pinches out.'

'It is just the place to lose money,' says the engineer as we stand alone waving the candles overhead. 'You see, this is no vein or lode, but only a series of patches of copper here and there. I knew it was no good the moment I saw the dip and run of the rocks on the opposite side of the stream. There is copper certainly, but it is only in detached bits or pockets; and fathoms of worthless rock would have to be got out to get at them; and then they won't yield enough to pay for the cost of reaching and getting. There are no true lodes here; this is not the right formation for them. It is just one of those mines which bring mining generally into disrepute. Folks put in capital and lose it in trying to find metal where none is, and then they say all mines are swindles. If investors would only look at the thing rationally, and take good advice, there would be fewer mines floated and fortunes lost. You must do the thing systematically now, and go to work where science indicates a likely spot, and give up the rule-of-thumb business, and not trust to the creeds and assertions of so-called practical miners.'

As we emerge from the tunnel, a pile of ore is shown which has been got out, and the captain triumphantly points to it as a proof of the genuineness of the undertaking.

But the engineer shakes his head, and points out that if the quantity was sufficient, yet the quality is not good enough to pay for getting and for carriage.

'Then you are not going to report favourably on the mine?' growls the Welshman.

'Certainly not. I shall advise my clients not to put a single sixpence more into it, for it can never pay.'

'There's copper there, I tell you. Why, we have got tons of it out.'

'I should like to see it,' replies the engineer, lighting his cigarette.

'What do you think of it, John?' quoth the captain hotly, turning to the mine-ganger.

'Oh, she'll pay ferry well indeed; and I would work her myself on tribute,' rejoins the miner; 'and if I was the owners, I would no let my heart be pricked by what the gentleman there will say.'

'Look here, John,' answers the engineer coolly. 'You be as good as your word. You work it on tribute; you find your own powder, charges, fuses, and steel, and you take half the value of the ore you get, the owners the other half, and you will soon see what my opinion on the mine is worth. I will do this, too, for my part: I will undertake to buy every ton of copper you get at one hundred pounds; and as the market price is only eighty pounds, you will clear twenty pounds extra profit.—Come now, that's backing my opinion fairly, is it not?'

But the stalwart wielder of the pick deigns no reply and with a muttered malediction, disappears into the mountain-side.

'Poor chap!' quoth X, as once more Jehu

whipped up his team and we began the nine miles' return journey to the inn at Wyllynttrwch. 'It's rather hard lines for him and his mates, for I expect my report will close the mine, and they will have to find work elsewhere. But what can I do? I must tell the truth, and say there is no chance of making the thing pay. The fact is, this district is not rich enough in ores, and it is no use hoping where there is no hope.'

So ended the inspection, from which great things had been hoped; and we who had entered the village in the early morning the objects of interest and friendly attentions from the inhabitants, who saw in us the harbingers of work and prosperous times—for it was soon told abroad what our errand was—departed by the evening train, regarded by the loafers and gossips as quasi-traitors, who would not honestly recognise in their lofty hills vast stores of ungoten wealth.

Perhaps, after all, one can excuse the native disgust, for the result of our visit was certainly to prevent a supply of English gold being hopelessly lost in a Welsh Copper Mine.

'COUNTING-OUT' RHYMES.

EVERY one, we imagine, is familiar to a greater or less extent with those rhymes used by children in many of their games, commonly designated 'counting-out' rhymes. In Scotland they are sometimes known as 'chapping-out' or 'titting-out' verses. They are used to determine who is to take the first turn at being 'it' in 'Hide and Seek,' 'Blindman's Buff,' and such-like games. When we hear children repeating these seemingly absurd and meaningless rhymes at their play, it never fails to carry our memories back to the happy days when we, too, could glibly rattle off the same or equivalent verses of doggerel.

In a work recently published, *The Counting-out Rhymes of Children*, by H. C. Bolton (London: Elliot Stock), the author has succeeded in gathering together a remarkable and interesting collection of children's rhymes relating to the subject of his volume. This collection, along with the compiler's remarks thereon, is worthy of more than mere passing attention, not only for the number of rhymes and variations given, but also for the examples of similar rhymes in different languages. This latter is abundant evidence of the world-wide observance of the custom among children of all nations.

Various examples are given of the different modes of 'counting-out' in different countries. The following method is, however, the one in most frequent and general use amongst all children. 'A leader, generally self-appointed, having secured the attention of the boys and girls about to join in the proposed game, arranges them in a row, or in a circle around him, as fancy may dictate. He (or she) then repeats a peculiar doggerel, sometimes with a rapidity which can only be acquired by great familiarity and a dexterous tongue, and pointing with the hand or forefinger to each child in succession, not forgetting himself (or herself), allots to each one word of the mysterious formula:

One-ery, two-ery, iekery, Ann,
Filliey, fallacy, Nicholas, John,
Queever, quaver, English, knaver,
Stinokelum, stanokelum, Jericho, buck.

Having completed the verse or sentence, the child on whom the last word falls is said to be "out," and steps aside. In repeating the above doggerel, the accent falls on the first syllable of each polysyllabic word. A very common ending is :

One, two, three,
Out goes she ! (or he) ;

and the last word is generally said with great emphasis, or shouted.

'After the child thus "counted-out" has withdrawn, the leader repeats the same doggerel with the same formalities ; and, as before, the boy or girl to whom the last word is allotted is "out," and stands aside. The unmeaning doggerel is repeated again and again to a diminishing number of children, and the process of elimination is continued until only two of them remain. The leader then "counts out" once more, and the one of them on which the magic word falls is declared to be "it," and must take the objectionable part in the game.'

When the youngsters are in a hurry to commence their game they frequently simplify and shorten the proceeding by repeating something like this :

Red, white, blue,
All out but *you* !

and the child to whom the word 'you' is apportioned is 'it.'

These rhymes, seemingly composed of senseless words strung together so as to form a musical or alliterative jingle, when subjected to close examination and analysis, are in many instances found to be corruptions of words and phrases which originally have had a distinct meaning and reference to definite subjects. Both in the Old and New Worlds, as well as among both savage and civilised peoples, the same custom obtains in an almost identical form to a greater or less extent. Even in the lonely islands of the Pacific Ocean we find the same practice in operation ; but in this instance it is not only the children who use the rhymes in their games, but the adults have somewhat similar formulas which they repeat when engaged in the heathen incantations connected with their idolatrous practices or drunken orgies. Here we have, in all probability, a clue to the origin of these 'counting-out' rhymes. As is well known to students of both sacred and profane history, the custom of deciding disputes or making selections for numerous purposes by the 'lot' was a prevailing custom among all nations. In Jewish history, we find the 'lot' frequently resorted to when any difficulty arose. Again, among heathen nations the 'lot' was a favourite resource for determining the selection of a required victim for sacrifice, and also for finding out the guilty person from a number of suspected individuals. It is more than likely that, in connection with heathen rites particularly, the priests were possessed of mysterious forms of words, which they used on such occasions ; and in some instances the mode of selection may have been practically identical with the harmless method now universally adopted by children for 'counting-out.' This, however, is a subject requiring more attention than we can at present bestow upon it. The now meaningless and unintelligible expressions in children's rhymes may be the relics of superstitious formulas used by the heathen votaries of bygone days.

A great many of these rhymes are evidently of common origin, but, through course of time and change of scene, have got so changed and transmogrified as to be scarcely recognisable. One of the most common and widespread examples among English-speaking peoples is that beginning, 'Onery, twoery,' of which the following is one of its most frequent forms :

Onery, twoery, dickery, davy,
Hallabone, crackabone, tenery, navy,
Discum, dandum, mery come time,
Humbledy, bumbledy, twenty-nine.
O-U-T, out !

Somewhere about one hundred different variations and versions of this rhyme alone are given. The following is one of several versions from Scotland (Aberdeen) :

Onery, twaery, tuckery, tayven,
Halalab, crackery, ton or clayven,
Peen, pan, musky dan,
Feedelam, fadelam, twenty-one.

From a work on the Gypsies by Mr Charles G. Leland, we have a specimen of a gypsy magic spell ; it is as follows :

Ekkeri, akairi, you kair-an,
Fillisin, fallisin, Nicholas ja'n ;
Kiri, kari, Irishman,
Stini, stani, buck.

This, on comparison, will be found to be almost identical with the first example we have given of a counting-out rhyme ; 'ekkeri, akairi' being the equivalent in Romyany for 'Onery, twoery.'

Another very familiar form is that commencing 'Eeny, meeny,' &c. This is a great favourite among American children, the commonest version being :

Eeny, meeny, miny, mo,
Catch a nigger by the toe ;
If he hollers, let him go,
Eeny, meeny, miny, mo.

This example gives evident proof of adaptation to American ideas ; but the preliminary and concluding 'Eeny, meeny' are of obvious German or Dutch origin. Such as :

Enc, tene, mone, mel,
Pastor, loné, boné, strei,
Enc, fene, herke, berke,
Wer ? Wie ? Wo ? Was ?—(N. Germany.)

An almost identical form comes from Cornwall, beginning :

Enna, meena, mona, mite,
Basca, lora, &c.

Some of the transmogrifications of words are very interesting, the 'Pastor, loné' of the German rhyme given above, we find in Cornwall as 'Basca, lora,' while in America it is changed into 'Pestalonny,' 'Pisky larry,' 'Barcelona,' 'Pennsylvania,' 'Butter lather,' 'Tuscalona,' &c. One of the most amusing transitions is in connection with the rhyme :

One is all, two is all, zick is all zan,
Bobtail nanny-goat, tittle, tall, tan ;
Harum, scarum, Virgin Mary,
Singleum, sangleum, jolly, oh, buck.

Here we have a very good illustration of the evolution theory of modern scientists. The first form of 'bobtail nanny-goat' changes to 'bobtail billy-goat,' 'bobtail dominicker,' 'bobtail vinegar,'

and at last, through course of time and altered conditions of existence, the despised 'bobtail nanny-goat' ultimately develops into the highly respectable form of 'Baptist minister!'

A curious and exceedingly interesting example comes from New England, thus :

Ain, tain, fethery, ip;
Arte, slatur, debbery, dick;
Aintio, taintio, fethertie, bumpit,
Ain-bumpit, tain-bumpit, gee-kit!

This is said to have been derived from the language of the Plymouth Indians in counting up to twenty, and the words are commonly believed in the States to be neither more nor less than a string of numerals in use by the aboriginal inhabitants of the continent. This, however, is a mistaken idea. The words are in reality a distorted version of modern Welsh; and similar words are said to be used in several parts of England and Wales by shepherds for counting their sheep, and also by women in telling their stitches while knitting. On comparison, this will be seen to be an unquestionable fact, as the following lists will show. The distorted form of Welsh is designated *Anglo-Cymric* :

Numerals.	Indian.	Anglo-Cymric.
One.....	Een.....	Aina.
Two.....	Teen.....	Peina.
Three.....	Tether.....	Para.
Four.....	Fether.....	Peddera.
Five.....	Fitz (or fip).....	Pimp.
Six.....	Sather.....	Ithy.
Seven.....	Lather.....	Mithy.
Eight.....	Gother.....	Owera.
Nine.....	Dather.....	Lowera.
Ten.....	Dix.....	Dig.
Eleven.....	Een-dix.....	Ain-a-dig.
Twelve.....	Teen-dix.....	Pein-a-dig.
Thirteen.....	Tether-dix.....	Par-a-dig.
Fourteen.....	Fether-dix.....	Pedder-a-dig.
Fifteen.....	Bompey.....	Bumfit.
Sixteen.....	Een-bompey.....	Ain-a-bumfit.
Seventeen.....	Teen-bompey.....	Pein-a-bumfit.
Eighteen.....	Tether-bompey.....	Par-a-bumfit.
Nineteen.....	Fether-bompey.....	Pedder-a-bumfit.
Twenty.....	Giget.....	Giggy.

This peculiar mode of counting was doubtless taught to the Indians by some of the early settlers, and in time the origin of the mode was forgotten, and it came to be looked upon as of pure Indian origin. So we find the children of the States seizing upon the peculiar words to form their doggerel rhymes, and in so doing unconsciously adopting words practically the same as those used by children in the old country, just as the latter had got theirs from the strange words in use by the Welsh shepherds. We notice the peculiarity of the different versions in being evidently designed for counting on the fingers. When the ten fingers are exhausted, eleven becomes 'one and ten'; twelve, 'two-and-ten'; and so on till fifteen is reached, when sixteen becomes 'one and fifteen,' &c.

Nothing shows the world-wide prevalence of the fashion of these 'counting-out' rhymes so much as the fact that we have examples in twenty different languages, numbering in all eight hundred and seventy-three different versions. America, Japan, Italy, France, Syria, Germany, Turkey, Greece, and other foreign countries furnish specimens, and many other countries could doubtless add considerably to the list. Of English rhymes alone, no fewer

than four hundred and sixty-four examples are given, and the list is undoubtedly very far from complete.

The whole forms a very interesting study in folklore; and Mr Bolton is still prosecuting his inquiries for adding to his collection, and any communications on the subject addressed to him at the Smithsonian Institution, Washington, U.S.A., will be thankfully received and duly acknowledged.

A SONG OF YOUTH AND AGE.

WHEN on the dimpled cheek of Youth
Health's blooming roses blow;
When songs of rapture, hope, and truth
From lips of beauty flow;
When youthful feet right gaily bound
Where thorn nor tare appears,
How joyously the days go round,
The weeks, the months, the years!

The Youth beholds with fearless eye
The lofty hill of Fame,
And hopes upon its summit high
Ere long to carve his name.
Joy thrills his heart; in every sound,
Fame's 'bugle-call' he hears,
And merrily the days go round,
The weeks, the months, the years!

The lady of his love must prove
A queen of beauty rare;
No vain coquette, but wise in love,
And true as she is fair.
Amid the tender stars at night,
He sees her dear eyes shine,
As, with a trusting fond delight,
He worships at her shrine!

When on the furrowed cheek of Age
Care's hollow wrinkles show,
The old man turns his life's last page
With trembling hand and slow.
Dark lower the skies; in every sound,
Death's mournful dirge he hears;
And wearily the days go round,
The weeks, the months, the years!

The Old Man sees through tear-blurred eye
The lofty hill of Fame,
Where cherished hopes in ruin lie,
Where none may mark his name.
One little lonely nameless mound
At every step appears,
As mournfully the days go round,
The weeks, the months, the years!

The lady of his love, alas!
Hath closed her gentle eyes,
With but one tiny tuft of grass
To show him where she lies.
'Old wife of mine!' he whispers low,
'Above thy grave I see
The star of Faith, whose beams I know
Shall guide me soon to thee!'

CONCERNING GIRLS.

MANNERS VERSUS LEARNING.

IN the last century, education was looked at from a standpoint very different from what it is now. Ignorance was not considered a disgrace, and to be uncertain in his spelling was no bar to being a gentleman. In the education of the girls especially, books seem to have borne a very small part, Dean Swift declaring, in his usual dogmatic way, that 'not one gentleman's daughter in a thousand can read or understand her own natural tongue.' Certainly in his generation, needlework and deportment were the chief things taught them. Dignity of manners was judged to be of more importance than book-learning; but as women are more adaptable than men, more capable of catching the prevailing tone of thought, they could hold their own in society in spite of their ignorance, as long as they were finely mannered and not hoydenish. Grace of carriage, therefore, good-breeding to make home peaceful and pleasant, piety to rule her private conduct, formed the ideal of perfection in woman. Thoroughness or exactness of knowledge was not thought compatible with these good qualities, and learned ladies were dreaded accordingly. The *Spectator* tells that 'a lady at court having accidentally made use of a hard word in a proper place and pronounced it right, the whole assembly was out of countenance for her;' showing how a woman who knew more than others of her sex was regarded, if she 'had dared to read and dared to say she read.' Dancing being the only physical exercise then allowed to girls, was much prized, both as a healthful exertion and a training in elegance and grace; and the dances of the period were nearly all in very stately measure. Most of us middle-aged people must still remember a few old-lady friends whose beautiful, attractive presence and gracious manner were at once the dread and admiration of our childhood.

In the present day, things are much changed. The girl's education is as thorough as the boy's.

No smattering of knowledge now contents us for them, but examinations as stiff and exhaustive are given to them as to their brothers, and with as good results. Along with this high mental discipline, the physical training goes hand in hand; so that what with boating, swimming, calisthenics, cricket, lawn-tennis, the physique of this and future generations should go on improving at a rapid rate. The idea that a beautiful girl must be pale and delicate-looking, and that, to be interesting, she must be ready to faint at the least exertion or motion, like the heroines in the old novels, is now quite exploded.

But in gaining all this mental and physical excellence, care must be taken that we are not losing the well-bred courtesy that used to sit so beautifully on our grandmothers, or the loss will be reater than the gain. In avoiding the ignorance of the past, there is the danger of going to the other extreme, of making learning of too much importance, or rather of making it all-important, forgetting that for the proper application of it other faculties are required; that a girl crammed with knowledge is only like a locked bookcase full of books, unless she has the power to use it for good and to give pleasure to herself and others. And what will give her this power? Only a proper training—which good manners or good breeding, as the essayists of the last century were fond of calling it, holds its proper place; and a greater injustice is done to a girl in leaving this part of her education incomplete than if her book-learning should not be exact and precise. It is only in childhood that this can be really acquired, that the easy courteous demeanour can grow to be second nature; and it is then also that the brusque boyish manner, so much to be deprecated, is formed.

The discipline to be undergone for this part of her education is also a great gain to the child, as great almost as the result, keeping in proper check, as it does, many propensities fostered by the emulation in the schools, and strengthening very opposite qualities. The one training places self in the foremost place, fosters self-will, want

of reverence, boldness, independence of character; all of which may not be evil qualities, but would be greatly improved by being controlled by the courtesy and graciousness of manner, which, while perfectly self-possessed, is thoughtful for others, full of deference for the old, and purely womanly in type. There is no true reason why an advance in learning should mean a decay in manners; the opposite ought to be the case; a true enlightenment ought to mean culture, and culture—refinement both in thought and observance.

Woman in the past has been the helper and consoler of man, and though other paths in life may now be opening to her, making marriage not so imperative, yet her real place and chief purpose is to be his *alter ego* and helpmate. Woman's influence is the most powerful of the great forces that affect men. It pervades everything. It is calming, soothing, elevating, and stimulating. While aiding men to do their duty, it makes them content in doing it, and keeps alive in them the love of social intercourse. To have this influence in the future, as she has had in the past, woman needs all the intellectual improvement she is at present gaining; but, added to it, she requires the grace and good breeding of the olden time, to make her a woman of high culture and noble aspiration, yet of loving womanly sweetness. It as often happens that such a one can uplift a husband to the dignity of her own character, as that a husband can uplift a wife to his own rank.

The tendency of the times has been to raise women more and more to an intellectual equality with man, and with this growth the sentiment has risen in their minds that the conventions of the world are against their complete development; that the rules of society have been formed for the comfort of the man without regard to the good of the woman; thus generating in many a feeling of bitterness and rebellion against a few of those existing customs. As woman's ambition has been roused by her new position, and her faculties awakened, a number of the sisterhood have protested against the old-time notion that she ought to steal through life unheard and unremarked—that it is a reproach for her to be talked of; and these, rushing to the other extreme, have been led to court notoriety, to despise conventionalities, and to adopt a hostile manner towards the other sex, while assuming a brusque demeanour that is not at all pleasing or attractive. As some writers have striven to set class against class, others lately have been trying to array sex against sex. Nothing could be more absurd. However close the relation between sisters, between mother and daughter, or between any two women, it can never be so strong as between husband and wife; and the tie between father and daughter, mother and son, or brother and sister, is usually the more binding because of the difference of sex.

Educating the one sex without any consideration of a probable affinity to the other, is therefore not advisable, still less the setting of them up in opposition. But as time goes on, the antagonism on the man's part towards learned ladies, as well as the bitterness on the woman's side for her treatment in the past, is dying out. It is in the woman's power to decide if

her kingdom is still to exist—if man is to be after all under her sway, as of old—if she means to fight the battle of life by his side, or as his rival. Her cultivated, bright intelligence will have to be put forth—not to lift her up above her every-day employments, but to throw a grace over her common acts, and to make her a centre of holy influences and innocent cheerfulness.

JOHN VALE'S GUARDIAN.

CHAPTER XXIV.

THE two boys were living in clover, and enjoying all sorts of privileges and immunities hitherto foreign to their experience. They were inseparable companions, and were both getting rarely tanned by summer sunshine, and rarely strong on an unlimited diet and a life spent almost entirely in the open air. On that particular day on which Mr Orme made his great discovery, John, under Jousserau's guidance, had got out his sketch-block, and with borrowed water-colours and brushes was dashing away victoriously at landscape, with a whole new world waking into wonder and beauty about him. At intervals, Master Will would take up his post behind the aspiring artist, and look on with a never-failing approval. Between whiles, he was ruining his garments and strengthening his limbs in the great schoolboy art of bird-nesting. He was back from one of his excursions with an empty starling's nest; and Jousserau, who had an unusual tenderness for all feathered creatures, was complimenting him on having chosen a season for his excursions when he could rob the parent birds neither of their eggs nor of their young. Master Will was listening quite unrepentantly to his sermon, when, from a field or two away, there rose upon the perfumed summer air an amazing shrill sweet piping of a child's voice, singing a hymn-tune, at first scarcely discernible for what it was. The singer had changed its time and its measure, and led it the giddiest heated race imaginable. Jousserau lifted his hand and turned to listen.

'There's Lydia,' cried John.

'Hush!' said the artist, and the boys stood quiet. 'What a wonder!' said Jousserau in his own tongue when the song had finished. 'Is it a bird? A child? An angel? What is it?'

'It's only a little girl we know,' Will answered. 'She's got a pretty voice, and she'll sing for anybody.—Lydia!' he called, 'Lydia!'

There was a shrill cry in answer, and a second later a tiny figure was seen impetuously climbing the gate of the meadow; and the solemn child came fluttering over the grass with a quick dancing step, to which her hands kept a flickering time, as though she moved to some inward inaudible music. She paused before the trio, and Will and John shook hands with her in schoolboy fashion. She went through that function gravely, looking at Jousserau meanwhile.

'Whose pretty child are you?' said the Frenchman in his quaint accent.

She made no answer to this inquiry, but offered her hand to him with an air of staid decorum. He took it smilingly, and drew her towards him;

and she, allowing her serious glance to wander all over him with an air of scrutiny, at length settled her regard upon one of the fine gold earrings he wore. When she had looked at it for some time, she touched it with a forefinger, as if to assure herself of its reality; and then walking gravely round the camp-stool on which he sat, inspected the earring on the other side and touched that also.

The artist's smiling bright face followed her motions attentively. 'Well?' he said.—The child folded both hands behind her and shook her head.—'You do not like—them?'

'No,' said the child decisively. 'Women wear earrings, not men.'

'And princesses,' returned Jousserau in his own language, 'are born to be obeyed.' He took a purse from his pocket, slipped the rings from his ears and put them away. 'Now?' he asked.

'I like you better,' the child answered.

'À la bonne heure!' cried Jousserau. 'Was it you who sang just now?'—The child nodded.—'Will you sing again?' She nodded once more; and drawing a step or two away, still keeping her hands behind her, struck up with that wonderful sweet clear pipe of hers the air of an old Huguenot hymn. Charles Wesley's pious hand had grafted it into the hymnology of his people, and its lovely passionless strain was as familiar in the Black Country of England as in its native Pyrenees. Jousserau heard it with a strange emotion, for his mother had sung it to him many a time in his childhood as she dandled him on her knee. When the little songstress had brought her tune to a close, he drew her towards him and kissed her with glistening eyes. 'So pretty child as you are,' he said, 'must have a *bon ami*.—What is *bon ami* in English, young John?'

'Sweetheart,' responded young John, having cudgelled his brains for a moment.

'Ah, yes!' cried Jousserau. 'Sweetheart.—You have a sweetheart, pretty child? No?'

'Yes,' she said, gravely and lingeringly.

'True?' said Jousserau. 'Who is he?'

The child stretched out a hand and took hold of young John. 'John is my sweetheart,' she said with perfect simplicity and gravity. 'He has been away for a year; but now he is come back again, we shall be married when I grow up.'

'Luckee dog!' said Jousserau, with an accent so quaint and a look so comic that the two boys burst out laughing.

At this point another voice arose from a little distance, this time an adult male organ, purposely gruff and surly: 'Wake up here! Wake up, I say! What brings a man lying in the road, stoppin' up-the traffic? this way? Dost want to get run over by the first wagin as comes this way?'

'That,' explained Lydia, with her customary gravity, 'is the old man from father's. He has gone to sleep in the road.'

The boys scoured off to see what was the matter, and in a second or two were heard shouting to Jousserau, both together: 'It's Mr Orme! It's Mr Orme!'

At this Jousserau ran also to the gate, and beheld Isaiah Winter in the act of stooping over Mr Orme, with both hands under his armpits. Isaiah was red in the face, and was tugging with

all his might, but unavailingly, to raise the disreputable rotund figure.

'The man's either very ill,' said Isaiah, relinquishing his task for a moment, 'or else he's stone intoxicated. He smells powerful strong o' liquor; but that's such a regular usual kind o' thing with him, it's nothing to judge by.—Lend me a hand, Mr Jousserau.'

Jousserau vaulted the gate, and by his aid Isaiah succeeded in bringing Mr Orme to his feet.

'Run away, you boys,' said Isaiah, 'and take the little gell with you. This is no wholesome sight for children.—Come up, you good-for-nothing. What brings him here, in the name of wonder?'

Mr Orme being vigorously shaken to and fro, opened one eye and gazed uncertainly about him. By-and-by, Isaiah came within his sphere of vision, and he smiled. His ordinary smile, as has been said already, was piteous and almost lachrymose; but now for a brief instant he twinkled with an actual jollity, though he went out with a startling suddenness, and falling back unexpectedly on Jousserau, gave the small man as much as he could do to balance him.

'There's a barn close at hand,' said Isaiah; 'we'll put him in among the clean straw and let him have his sleep out.—Come along, you temperance lecture!' So saying, Isaiah took Tobias firmly by one arm, whilst Jousserau guarded him in a similar fashion on the other side, and between them they marched the degraded old wreck along the lane until they came to the outbuilding of which Isaiah had spoken. The doors were open, and there were piles of clean straw within. They laid their burden down here, and were about to leave it, when Jousserau observed the dirty clay bowl of Mr Orme's constant companion protruding from the waistcoat pocket.

'Not so,' he said, and confiscated the pipe at once.

On this hint they rifled the worthless old gentleman in a search for matches, and he, waking up under the operation, protested blandly. 'Don't give yourselves any further trouble, gentlemen,' said Tobias; 'I am not worth it.' On this reflection he wept, and said that he was a dreadful moral lesson, and that he hoped that his friends would take example by him. Then he cleared with marvellous quickness, and said that he was a millionaire. 'Help me up,' said Tobias, 'and I'll tell you something.'

Isaiah, not quite understanding the request, which was very indistinctly mumbled, but thinking that he understood Mr Orme's gesture, tugged him to his feet.

'You'd like to know,' said the sordid spectacle, clinging to him, 'but you won't.' He put on an aspect of great cunning, and stammered himself with difficulty, winked twice with painful elaborateness. 'You won't know anything. If you want to know anything, shouldn't throw man's hat over the hedge. That'll cost you thousands, Mr Winter. Hundreds thousands.'

'Let go o' me,' said Isaiah disdainfully. 'What are you chattering about?'

'Chattering about?' echoed Tobias thickly. 'I'll tell you,' with an air of sudden confidence. 'Coal, my good friend, has been discovered on this side the Great South Staffordshire Fault. On the

side.' He tried to emphasise the word by a stamp of the foot, and in doing so, lost his equilibrium altogether. He and Isaiah releasing their hold simultaneously, he fell back upon the straw, and continued, unconscious of his change of posture: 'It's in Farmer Day's back garden, on the surface.—The owner of the land,' he explained elaborately, as he peered for Isaiah's face among the rafters, 'is unscientific; he is unaware of the value of his discovery.'

Isaiah was in a state of prodigious excitement at this intelligence. It was obvious that the little wretch was absurdly drunk, but in spite of that fact, the amazing intelligence he gave might still be true. He seized him by the coat and dragged him into a sitting posture. 'What's that you say? There's coal in Farmer Day's back garden? Why, the man's a bankrupt, or next door to it; and if that's true, he's got a fortune. Say it again, you scandalous object; say it again.'

'No,' said the scandalous object, shaking his head with an aspect strangely compounded of regret and cunning; 'you might have known all about it, Mr Winter, if you'd treated me properly. But you assaulted an elderly man, Mr Winter, an elderly and defenceless man. I am constitutionally timid—it took him a mighty effort to achieve the word—and your conduct shocked me, shocked me. Mr Winter, I shall tell you nothing; I shall keep my news for Mr Snelling. Mr Snelling is a gentleman, and he and I are going halves.'

Isaiah once more deposited Mr Orme upon the straw, and beckoning Jousserau from the barn, made his way into the lane.

'What is it?' Jousserau asked. 'I do not understand.'

Isaiah explained to him as they went along; and the little artist had no sooner understood, than he caught the infection of Isaiah's excitement. 'He is scoundrel, that fat drunken Orme,' he cried. 'If the coal is there, it is to Mr Day. Is Snelling so much villain he would buy the poor man's land and say nothing?'

'Mr Snelling's a pretty smart man of business,' Isaiah responded. 'Nobody would think the worse of him for doing that.'

'I should,' Jousserau protested.—'Look at that.' He held out his nervous little brown right hand. 'That is all I have; that feeds me, clothes me, helps poor friends, does all. You shall chop it off here, marking the wrist with a vivid forefinger, before I will be so base. Oh no! Justice is the greatest thing.'

'Perhaps you're right,' said Isaiah phlegmatically. 'I'm going to do the straight thing, anyhow. I've got a few cool hundreds at the bank, and if that little fellow's news is true, I shall put 'em at the farmer's service. I've got two or three cool hundreds.' He walked on energetically, and Jousserau kept equal pace with him.

'Tell me,' said the Frenchman, 'if there is coal beyond this—what do you call it?—Fault—is it everywhere under our feet?'

'Most likely,' Isaiah answered.

'Then it will spoil this side, and make it black like the other! Everywhere the dark cloud, everywhere the smoke, the noise, the dirt?'

'Yes,' said Isaiah; 'it'll stretch the Black Country for miles and miles.'

'Then I will hope it shall not be true,' said Jousserau.

'A bit o' dirt's cheap bought,' said Isaiah philosophically, 'if you can feed a million people out of it. Look at Brummagem—it lives on coal. Look at Hampton, Bilston, Wedgebury, twenty others—coal keeps the lot of 'em. I can remember many and many a hundred acres growing nothing but grass and thistle, as is covered now with streets and houses, with thousands of happy and contented people in 'em. It's a bit black, to be certain, but what's that matter? It's wholesome. If you'll look at it, Mr Jousserong, you'll see as we're a pretty stalworth set o' people. There's no harm in a bit o' dirt.'

They were at Farmer Day's gate by this time, and Isaiah entering with a rapid step, caught sight of the farmer himself as he passed the kitchen door, and gave a loud 'Hallo!'

'Hallo!' cried Day in answer, appearing in the doorway.—'Oh, it's thee, Isaiah. Come in, lad. There ain't much to ask a friend to nowadays, but what there is, thou'rt welcome to.'

'I'll tell thee what,' returned Isaiah. 'If what I've heard is true, I'm the welcomest man thee'st clapped eyes on this twelve months.—Where's that coal-hole o' thine?'

'Coal-hole?' returned the farmer. 'What coal-hole?'

'I've heard,' said Isaiah, 'that you've found coal on the surface in your back garden.'

'We've lighted on some coal, to be sure,' the farmer responded. 'We was digging for water there. It appears to me,' he added drawlingly, 'as somebody must ha' laid in a boat-load in old time. It's most likely been there so long it's got growed over and buried and forgot. It's all growed and welded into one solid lump.'

'Let's have a look at it,' said Isaiah. 'Come along. Wheer is it? Bring a pick with you.'

'Go round,' said the farmer, with no touch of the excitement which consumed the other. 'I'll meet thee at the back-door.'

A minute later they were standing above the exposed coal-bed. Isaiah bore the pick, but he made no use of it. He looked in silence for a full minute, and then stepping into the hole, took up a fragment from the bed and broke it in his fingers.

'Farmer,' he said, 'you came to me a week or two ago to borrow two hundred and fifty pounds.'

'Well?' said the farmer.

'Same mind still?' demanded Isaiah laconically.

'Yes, lad; more than ever.'

'All right,' said Isaiah. 'You can have it, and a couple of thousand to the back of it.—There's a fortune here.' He raised his hand high, and threw down the lump of coal he had taken up a minute earlier. 'I'm standing here,' he said with a solemn face, 'for all I know, or thee knowest, above uncounted millions. The Bank of England couldn't buy what this means.'

The farmer fairly gaped at him; and without the slightest warning, broke into blubbery tears. He was so surprised at this, that his own amazement checked him, but he could do nothing but stare at Isaiah like a man distraught.

'They put a bum-bailiff i' the house this morning,' he said, when he had recovered himself a little. 'That was Bob Snelling's doing. I thought he'd ha' been better-hearted than run

an old friend to ruin for two hundred pound. Fifty he's counted for costs, and I've paid him a hundred a'ready. There's a mortgage falling in for fifteen hundred in ten days. I reckoned on going back to the plough-tail, or turning bailiff for somebody. I dar' not think about th' old woman and the little wench.—D'ye think it's true, Isaiah?'

Isaiah fumbled in his pocket and drew out a cheque-book, greasy with long repose there. He stopped to dust his coal-smeared thumb and finger upon his trousers, and then fluttered the leaves of the cheque-book. 'Come indoors,' he said, 'and I'll show thee whether I think it true or no. I'll take the mortgage here and now, and I'll lend you five hundred to go along with. You give me a paper saying I'm your partner, halves and halves, and we'll work this thing together.'

The farmer shook hands with him, almost frantically, and Jousserau, who was as excited as either, shook hands with both.

'Who's that?' Day asked Isaiah, drawing him on one side and speaking in a whisper.

'He's a lodger o' mine for the time being,' responded Isaiah, 'and as good as gold, though he is a foreigner; and what's more, he hates Bob Snelling like poison.'

'Then he's a friend o' mine,' said Day.—'Young man, I'm pleased to mek your acquaintance. Come indoors.' He had betrayed himself once already, and having hal time to think about it, was profoundly ashamed of his own emotion. He went rolling into the house, therefore, with a dogged and inexpressive countenance. 'Missis,' he said, addressing his wife, 'the money troubles seem to be all over. Mr Winter will tell you all about it.'

NATIONAL HABITS OF HOARDING.

From the earliest times till now, a love of gold has filled the breast of man alike savage and civilised, being implanted there as an almost ineradicable instinct. This 'gold-hunger' has impelled men in every age to deeds of 'high emprise,' has shaped their thought and coloured their lives. The savage values gold; for its possession gratifies one of the rudimentary feelings of his nature—the passion for personal adornment—a purpose to which gold has been applied, so soon as discovered, by nearly every nation. From being thus the object of universal desire, it acquired a constant value; and as it was eagerly coveted, there was danger as well as difficulty in retaining it securely; hence it came to be hidden and stored in 'out-of-the-way places. As far back as the remote Homeric times, gold, according to Mr Gladstone, was hoarded up. Large quantities of it were unearthed by Pizarro and Cortez in Peru and Mexico, access to it being forced from the natives under threats of torture or death.

In the absence of the precious metals, the North American Indian lays hold of 'wampumpeng,' which consists of black and white shells made into beads strung into belts or necklaces. These wampum beads are collected by the Indian chief,

who regards them with the affection of a miser for his glittering hoard; and for security, they are placed in forest glades, by lonely lakes, or deep below the wigwam fires.

The same love of finery animated the Goths and Celts as they rolled their gold into spiral finger-rings, or welded it into uncouth-looking necklets, armlets, and bracelets, which they wore on their persons. The ancient Egyptians were fond of like ornamentation, and they concealed their valuables in well-sheltered spots. In ancient Greece it was customary to hide coined money in the temples, and to bury it deep in the ground. Many coins found in a good state of preservation establish the existence of extensive hoards in these far-back times. The natives of Calabar appear to bury their treasure as a dog hides his bone in the earth, for they have no other place of security in which to deposit it.

But an immense amount of hoarding occurs even with nations who enjoy the means of safe-keeping which banking affords; among such are the various tribes and peoples of which India is composed, that country being par excellence the land of hoarding. In China there are in existence very stringent laws against hoarding.

The precious metals have possessed in many respects a greater importance among eastern than western nations, serving as materials for the fabrication of articles of ornament or luxury. Unlike the western, the eastern races have yielded to the tyranny and exaction of their rulers; and pitiable would have been the condition of the latter races had there not been some form of property the possession of which could be concealed without impairing its value. In a word, it is oppression which has primarily led to hoarding; or, as Sir Charles Trevelyan phrases it, the system of hoarding arises from habits induced by ages of misgovernment. These habits and their corrupt source are thus described by an old writer on Hindustan: 'The rajahs never allow their subjects to rise above mediocrity. The Mohammedan governors look upon the growing riches of their subjects as a boy on a bird's nest: they eye their progress with impatience, and come with a spoiler's hand and ravish the fruits of their labours. To counteract this, the Gentoo bury their money underground, and often with such secrecy as not to trust even their own children with the knowledge of it; and it is amazing what they will suffer rather than betray it. Their tyrants use all manner of corporal punishments, but that often fails; for with a resentment prevailing over the love of life, they frequently rip up their bowels or poison themselves, and carry their secret to the grave.' The period referred to was one of insecurity, when wars, by disturbing peaceful pursuits, swelled the number of those subsisting on spoil. It was the time, too, of the warlike Mahratta, the Pindaree robber, and the Mogul tyrant emperor. A necessity was thus laid on all who had no desire to be despoiled, to hide their hoards; and these were representative of the most condensed form of value in which wealth could be expressed; while the place of deposit was a guarantee for the ultimate safety of the hoards.

But though British law has supplanted native rule to a great extent, and the fear of personal as well as material danger no longer exists,

hoarding still continues, the hereditary habit being too powerful to be readily broken up after enduring for centuries. An attempt was made by the British government in 1882 to get hold of hoards by offering high rates of interest for them; but it turned out a failure.

It is difficult to estimate the amount of gold hoarded in India; but it was approximated before the Royal Commission on Bimetallism at one hundred and thirty millions sterling, which was the amount imported during the last fifty years, and is exclusive of the hoards for centuries past. The silver was computed at about one hundred and seventy millions. This yields for both gold and silver a sum of three hundred millions, which represents nearly one-third of the value of the total amount of coin (£1,000,000,000) estimated by Dr Soetbeer to be in circulation in the world.

The form which the hoarding takes is that of bullion or coin, and frequently the metal is made into ornaments, partly used for the purposes of adornment, and partly kept as a hoard. As a rule, the native prefers it in the form of ornaments for his family, because it is a hoard; and it is also a source of gratification to them to possess these ornaments. The simplest form of jewel or ornament worn by the natives is the thick gold or silver wire twisted into bangles or bracelets. The latter are made by the silver-smith, to whom the poor Hindu betakes himself when he has saved a few rupees. These are soon melted and beaten up into the necessary article of ornament and hoard. Silver is also hammered into brooches and torques in imitation of knotted grass and leaves; while armlets, anklets, and such-like are freely fabricated. Solid or hollow gold lumps, in the form of cubes and octahedrons strung on red silk, appear as another form of stored wealth. As may be supposed, the gods of India, which are many, absorb much of the molten gold and silver of the country. One notable design is called *Swami*, and consists of an ornamentation of figures of Hindu gods in high-relief, beaten out from the surface, or fixed by solder or screws. In Southern India, there are vast stores of gold and silver in the temples. The poor people have no strong-boxes or safes in which to place their valuables, and so they generally put their hard cash and ornaments within brass *lotus* or *bahagunas*, and then bury them underground somewhere in the room in which they sleep, preferring for this purpose the ground below their beds, or disused wells and other out-of-the-way places.

Jewelry stands high commercially in India, for it always commands a ready sale. A jewel there is a veritable 'joy-giver,' as the origin of the word implies. It is reckoned the most solid kind of wealth; and fortunes are never counted without estimating the value of the stock of jewels. They perform a great matrimonial function, the poorest bride having her dowry, often equal in value to several years' of the bridegroom's income. One of the greatest boasts of the jewelry owner is, that his hoards are not taxed, for he may be possessed of jewelry worth one hundred thousand rupees, and yet pay no income tax, for the simple reason that the hoards yield him no income.

But hoards take also the form of coined money

and bullion or bars of gold as well as jewelry. At the present time, it is believed that ten millions of British sovereigns are hoarded in India, chiefly in the Bombay Presidency, where the impression on them of St George and the dragon appears to be valued on religious grounds. There are also vast quantities of the native coinage stored, the mohur being the principal coin in hoards. It is of gold, and of the weight and fineness of a silver rupee, its value being about thirty shillings. This hoarding absorbs all the gold that pours into India, and very much of the silver, although the latter is the circulating medium. As the natives get wealthy, they prefer gold. A wealthy man will prefer ornaments of gold for his family rather than silver; and the very poorest classes use ornaments made of some base metal, neither gold nor silver, but in which there may be some silver.

Gold is also distributed in connection with ceremonies. It is a custom among the natives of India to give you what is called 'pawn,' which is the signal for you to leave after an interview, and some gold is used for ornaments bestowed in this way. In Delhi alone it was estimated that one hundred pounds a day was used in manufacture connected with 'pawn.'

In the courts of the native princes of India hoarding takes place on a vast scale. The Maharajah of Burdwan died lately and left a large hoard. It proves that anterior to 1835 there was much hoarding, when it is stated that the Maharajah had withdrawn from his store two hundred and thirty thousand pounds of silver, which was in the form of Sikka rupees, none of which have been coined since 1835. A letter was submitted to the Royal Commission on the subject of the Maharajah's hoard. A description was given of the several treasure-houses in the estate, their dimensions, and their contents: 'One large room measuring about forty-eight feet in length, fourteen feet six inches in breadth, and thirteen feet nine inches in height, where gold and silver ornaments, and ornaments set with precious stones, are kept. These articles are in *almirahs* and boxes of all descriptions, and also some gold plates and cups, *thalies* and *katorahs*, as well as washing-bowls, jugs, &c.' Other two rooms contain silver domestic utensils, forks, spoons, &c., and, strange to say, English dinner and breakfast sets all of silver. Two of these rooms were under lock, and the doors bricked up. There are four other rooms, one containing ornaments of gold, silver, and precious stones, gold ornaments and throne; other two containing the reserve treasury, which included the estate collections and government securities and debentures; while the other is thus described: 'The fourth room measures about twenty-two feet six inches in length, fifteen feet in breadth, and twelve feet three inches in height, where there are two large-sized vaults prepared for hoarding the current silver coin; and since the year 1267 B.C., some money was from time to time put in and taken out by the Maharajah Mahtab Chund Bahadoor for the expenses of an emergent and extraordinary nature, such as the late Maharajah Aftab Chund Bahadoor's marriage, Lala Bun Behari Kapur's marriage, and buying landed properties. When he died, one lac was left in one of the vaults.' In another apartment the ornaments belonging

to different gods of the family were kept, and silver *thalers*, *sapianis*, &c., for the religious purpose, the room being locked and sealed. It was the custom of the Burdwan Raj family to confide the custody of these valuables to the Maharanee for the time being; but the vaults were never inspected save in presence of the Maharajah. When sums were withdrawn, only relations and trustworthy servants were admitted into the room and vault. Treasurers and dewans used to be present outside the room or apartment, where the sum drawn was sent out (female guards being placed in the passage), for the purpose of weighing, counting, and bagging it before it was sent to the mint.

Other instances of hoarding were given by an officer of the Indian Post-office in 1886, who stated that a native prince was then hoarding gold at the rate of forty to fifty thousand pounds a year; and on the death of two native princes recently, it was believed that they had left four million sterling each. One of these princes took a loan of half a million from the government of India in 1877, when he must have been in possession of a large hoard himself, for it is a point of honour with a family not to break into a hoard, which is treated with the sacredness of a family picture. When the prince in question had to make a payment to the government of India for a purpose in which he was interested, and was asked when he could make the payment—a payment of one hundred and fifty thousand pounds—he said: 'At any moment.'

Hoards are only drawn on in extreme cases, and it is such calamities as war, or the great famine in Madras or Bombay, that will bring them out. During these famines, bullion or ornaments were taken out of the hoards and sent to the Bombay Mint, to England, or impledged with the native banker or money-lender. But unless under very special circumstances, the gold and silver of which the hoards are composed are drawn in without any intention of returning to circulation again.

In these days of gold appreciation and silver depreciation, the absorption of gold on so vast a scale becomes a serious question. It may well be asked, What prospect is there of an early termination of this gold-hunger and hoarding? We fear some centuries must elapse before any serious diminution of it takes place. Much will depend on the growth of western civilisation and ideas among the natives of India, and such a change in the disposition and habits of the people as will lead them to place their means in investments which will yield a certain rate of return. Already they are to a slight extent reaping remuneration from cotton mills and other industrial investments; while the permanent institution of Post-office savings-banks bids fair to be largely taken advantage of by them.

Quitting the semi-civilised nations of the East, we now turn to the habits of the less hoarding and more civilised western nations. It has been remarked generally, that thrifty people like the French, Swiss, Belgians, and Dutch hoard coin more than the Scotch and English. The Irish were addicted to hoarding bank-notes; but the practice prevailed in former years more than now. In Italy, large quantities of gold and silver were hoarded from 1862 to 1865, because paper money

was then declared legal tender, or forced on the country. In 1881-83, the gold standard was established in Italy, and the gold necessary to effect this change was drawn to a great extent from hoards. In France, a great deal of hoarding has existed for a long time, especially among the peasantry, who are the most parsimonious in Europe. Many causes have contributed to the formation of this habit, not the least being the insecurity arising from the unsettled forms of government in France. Lately, however, these hoards have been extensively drawn on in connection with the payment, at the close of the Franco-German War, of the French indemnity of eighty millions sterling. Of this amount, one half was paid out of French hoards. An ex-governor of the Bank of England, in his evidence before the Bimetallic Commission, estimates the contributions from hoards as equal to two-thirds of the amount of the indemnity. In illustration of peasant-hoarding, he related how one of the leading French bankers told him that at the time of the siege of Paris he left Paris to go and look at his estate in the neighbourhood. He went up to one of the peasants and told him that he had just come out to look after his affairs, and that he was very anxious to pay his people their wages, but that, under the circumstances, he had no money. The peasant said: 'If forty thousand francs [sixteen hundred pounds] are any good to you, I have got them in a stocking under my bed; and I will go and fetch them.' They were in gold coin. These hoards the French government wisely attracted by offering inducements to the peasant classes in the way of preferential allotment of the *Rentes*, or through premium on the price paid.

Hoards are not common in Germany; but there is a large war-hoard lying at Juliusburg, in Spandau, belonging to the government, of one hundred and twenty million marks, or six millions sterling, which goes under the name of the German Empire War Treasure.

In Great Britain, civilisation is too far advanced, and the love of interest on capital too great, to allow of habits like the foregoing making headway. Any hoarding there may be consists for the most part of those coins—jubilee, token, and current ones, as the case may be—which have found their way into museums and coin-hunters' cabinets.

NABOTH'S VINEYARD.

CHAPTER II.

By dint of long morning lounges in the County Club, of which select institution he was a member, Colonel Sandhurst succeeded in killing the three heavy days which divided him from his son's company. Not that he was altogether a martyr to boredom, for there were many delicate plans to be finally settled; last, but not least, the master stroke of inviting his ward, Miss Ethel Morton, and her aunt to be his guests for a few days, and thus bring the heiress in immediate and close contact with Captain Frank Sandhurst, his reputation and his Victoria Cross. This latter coveted trophy had been won some twelve months before in one of the recent South African wars.

The diplomatic old soldier stood in the elegant

private sitting-room devoted to his use, consulting his watch impatiently, for it was approaching the hour of seven, and the expected travellers were due; it having been so arranged that they might travel down from London together, and thus cement the friendship. It was therefore a considerable disappointment to the Colonel when the ladies arrived by themselves, the recalcitrant swain having failed them at the last moment.

'He will be here by the mail,' Miss Morton explained, when the preliminary greetings were over. 'It was some tiresome business at the War Office, I believe he said. Perhaps the Commander-in-chief required his opinion upon some important matter. But really I am so hungry that I can't sympathise with you over the terrible affliction.'

Colonel Sandhurst pulled the bell with more than necessary violence, while his fair visitor looked out on the broad street below with languid interest. She was a pleasant, merry-looking blonde, with fair hair, and kindly blue eyes full of mischief; but withal sympathetic and true as steel to her friends. Miss Cramer, the aunt in question, was a gentle placid nobody, who was only too glad of the opportunity to efface herself on every occasion, the sort of easy-going old lady who, if properly clad and regularly fed, asked nothing more from her fellow-creatures. If asked what she lived for, she would have shaken her head smilingly, and declined the solution of so solemn and unnecessary a problem.

Over his soup and glass of brown sherry, the colonel succeeded in recovering his lost equanimity. The dinner was well served, the Wye trout and ducklings delicately cooked, and the colonel was but mortal. By the time the peaches had arrived, his brown face beamed with hospitable smiles. 'Beautiful neighbourhood,' he observed patronisingly, 'and salmon-fishing excellent.—Now, if there was only a house on the Bartonsham property, we might make a pleasant summer here.'

'I suppose the people are civilised?' Miss Ethel returned, helping herself to some grapes. Miss Cramer had long since dropped into one of her waking trances. 'Let us go and sit out on that pretty balcony among the flowers, and study the Castlefordian in his native lair, as we used to do at San Remo. Besides, I know you want a cigar.'

They took their chairs out on to the balcony in the fading light, looking north to an old church with tall gray spire; and immediately before them, beyond the elms where the noisy rooks were swinging, rose the square cathedral tower. The Colonel lay back and smoked his tobacco with a feeling of perfect tranquillity and contentment.

'Yes,' he continued, 'it is a great pity there is no house at Bartonsham. In that case we might stay here till the autumn, and learn something of the county. They say the Wye tour is as beautiful as the Rhine.'

'Why not build a house?' asked the listener, toying with a rosebud.

'Ah, but you see I have a better plan than that. It is so long since you were here before that you probably forget Fernleigh.'

'Indeed, I do not; that is, if you mean that fine place on the Lugwardine Road. I believe I loved that house more than any one I ever

saw. When I get old and careworn, I shall like to have just such another place to call my own.'

'Perhaps there are more unlikely things than that, because, you see, I am in negotiation for the purchase of that very house.'

'Indeed!—Do you mean to say the owner is actually selling it?'

In spite of his jubilation at this outburst on Miss Ethel's part, the gallant Colonel's conscience gave him a sharp twinge. It seemed very strange that he could not help being conscious of a certain guilty feeling of remorse for the part he was playing. 'Yes; but not from choice. It appears that there is some law business pending in which the owner is interested. I never had any head for that kind of thing, consequently I did not pay much attention to Heath's explanation.'

'It seems very hard,' said Miss Ethel sympathetically, as she watched the golden points of flame. 'Having a pet lawsuit of my own, I can feel for the luckless owner. But then men do not feel the same sentiment in these things as women do.'

'But you see the owner happens to be—a lady.'

'And you are actually going to turn her out?—Colonel Sandhurst, I am ashamed of you! Really, you should'—

But any further scolding for the Colonel was interrupted at this moment by the rattle of wheels below and the sound of a well-known voice giving orders to an hotel servant. In less time than it takes to tell, Colonel Sandhurst was grasping his soldier-son's left hand, the right being supported across his breast by a silk bandage. The Colonel's lip quivered slightly, his eyes glistened as he looked into his boy's face. Miss Ethel gave a rapid sign to Miss Cramer, fortunately awake, and together they left the room, closing the door behind them; and a full hour had elapsed before they were missed by the serenely happy father.

The next morning being perfectly fine and breakfast over, the Colonel proposed a walk, a proposition declined by Miss Morton on the ground that she had a vast amount of business in the way of shopping to do. So the Colonel, nothing loth, started off with Frank Sandhurst to explore the lions of the town. They passed through the Close, under the ancient elms shading a smooth shaven lawn, into the Castle Green, where erstwhile a border fortress stood, with the silver Wye at its feet and the smiling landscape beyond. A pleasant spot to pass an hour in the leafy shade with a glimpse of the old moat, and white swans floating on the water, and the air laden with the fragrance of the hawthorn. For a time they sat in silence, this old war-worn warrior and his gallant son, watching the flowing water as it hurried downwards to the sea.

'It is good to be in England again,' Frank observed at length. 'After that broiling climate out there, the sight of a green field and cool stream makes it seem like home.'

'No place like England, after all,' rejoined the Colonel. 'And, talking about home, I hope you have made up your mind to stay. If I let you have the place here with the house I am buying, don't you think you might cut the army, and settle down in the usual fashion?'

'By which you mean matrimony, of course.—To tell you the truth, I have never given the

matter anything but the most vague consideration. Naturally, I shall marry some day; that is, if I can find some "fair impossible she" who is rash enough to care for me.'

The Colonel stole a side-glance at the speaker's manly figure and handsome bronzed features, and thought that such a contingency was by no means so remote as the modest youth would imply. 'You have not seen one up to now, then?'

'Well, n-no,' Frank returned doubtfully. 'I was never much of "a squire of dames." There was one girl I met out yonder; I very nearly forgot her. Yes, perhaps if I had had more opportunity, I might—' 'Dad, she was the nicest girl I ever came across—one of the nurses, you know.'

'An hospital nurse!' said the Colonel coldly. 'Not precisely the wife a Sandhurst would generally choose.'

'More fool the Sandhurst, then,' Frank replied as coolly. 'And as a matter of fact I may mention that if it hadn't been for that same lady—as she was a lady, too—you and I would not be sitting here to-day.'

'That is always the way with you romantic boys—every little service rendered and paid for in the usual way is magnified into a great debt of gratitude.'

'If life is worth living, then I owe mine to her.'

'And probably would lay it at her feet, after the good old-fashioned lines laid down in ancient comedy,' returned the father, pulling his long moustache in some irritation. 'And regret it ever afterwards.'

'She had a beautiful face,' Frank continued, speaking as if to himself; 'a perfect face; fair, with glorious violet eyes. Fancy her coming all the way from England to nurse a brother who was wounded! He died, you see; and she stayed on to do all the good she might. Then she found me unconscious, and at death's door, and nursed me to life, God bless her! because I was something like her lost one. Under Providence, I owe my health and strength to her.'

'It was nobly done,' cried the Colonel, catching some of his son's enthusiasm. 'I should like to hear the name of this angel of mercy.'

'That is precisely what I can't tell you. I did ask her more than once when I was getting better; but she never would disclose her identity. "Call me Gladys," she would say; "it reminds me of my dear brother;" and Gladys I always called her afterwards.'

'Um! You seem to have done considerably well for an invalid,' said the Colonel grimly; 'fortunately, that kind of romance soon wears itself out. And besides, I have formed other plans for you.'

'That's uncommonly kind of you,' returned the younger man as grimly. 'Let us be candid.—Who is the lady you have chosen?'

'What do you say to Ethel Morton?'

Frank burst into a laugh so spontaneous and full of merriment, that the Colonel was compelled to stroke his moustache to hide a half-smile, though his face preserved the same look of judicial gravity.

'My dear father, you can't be serious? Consider how long we have known each other, and how well we understand the weaknesses of each

other's disposition. Besides which, there is another Richmond in the field.'

'Oh, indeed,' cried the Colonel ruefully. 'That's the first I've heard of it.'

'It didn't take me long to find it out. You don't suppose that a really nice girl like Ethel can go through the best part of two London seasons without admirers?—' 'Cresswell told me.'

'Oh, it's Cresswell, is it? Now I come to remember, he has been uncommonly civil to me the last month or two.'

'That's the gay Lothario. We had a talk about Castleford a few days ago, more particularly touching the salmon-fishing. He seemed to be very much inclined to run down here for a week or two. I shouldn't be at all surprised if he turned up at any moment.'

When a man has been nursing a pet scheme for some years, till it becomes almost a part and parcel of his existence, the sense of defeat is very humiliating. And so the Colonel found it at this moment. Not that he altogether despaired; but then Sir Edwin Cresswell was a gentleman of fortune and irreproachable social position, such as no guardian would have the right to dismiss on politic grounds.

'I might have anticipated something like this,' he replied in much perturbation. 'That is the worst of having girls to deal with.' So saying, Colonel Sandhurst rose from his seat and strolled townwards. Not that this unexpected contretemps affected his opinion respecting the purchase of Fernleigh; though he felt somewhat sore, and not a little inclined to be quarrelsome even with his much-beloved, who walked alongside with a grave face, at the same time observing a discreet silence.

'So the Morton scheme is postponed *sine die*?' he asked, as the Colonel made a pause at length on the steps.—'No, thank you; I am not going into the club this morning. If you don't mind, I will look up Ethel, and give her my assistance in the proposed raid upon the local tradesmen.'

Frank Sandhurst stood for some moments before his hotel door, idly smoking, and contemplating the passers-by. In a small country the contemplation of human nature is apt to pall, even with the most enthusiastic student of his fellow-men; and Sandhurst, after a few moments, felt his interest in Castleford affairs to be rapidly fading. A native of the sunny South grinding popular tunes upon an em-piercing organ, and the gyrations of some merry children, were not calculated to rivet attention; but presently, when a slight elegant figure in deep mourning emerged from a chemist's shop opposite, and walked rapidly towards All Saints' Church, the young gentleman's languid interest quickened into something like emotion. 'If that isn't Gladys, my eyes greatly deceive me.' Saying these words, to the extreme astonishment of a passing stranger he dropped his cigarette and started in pursuit of the rapidly vanishing figure. Turning along High Street, she proceeded in the direction of High Town, where Frank arrived just in time to see her disappear into a passage between two shops, on the lintel of one being a brass plate bearing the legend, 'Heath and Starling, Solicitors.'

'Well, I'm in luck so far,' murmured the disappointed youth, as he gazed blankly at the dim

portals beyond which the peri had flown. 'Mem. To cultivate my old friend Heath's acquaintance without further delay. It wouldn't be a bad dodge to leave my card and ask him to call round at *The Dragon* after dinner.'

It was not until some time after the meal in question that the lawyer made his appearance. He found Sandhurst and Miss Ethel seated on the balcony, the Colonel being engaged to take a hand at whist with a trio of old military acquaintances, a class of gentlemen who abound in the majority of cathedral towns. At this apparently deep stroke of diplomacy to engender confidence and hasten the consummation of love's young dream, Mr Heath smiled to himself, but what he said was that it was a beautiful evening and delightful after the hot afternoon.

'Why haven't you been to see me before?' Ethel demanded. 'I can't come to you now, as I used to in the old days, and upset the inkpot over your cleanly engrossed parchments.'

'Do you remember that?' the lawyer asked. 'What a memory, to be sure! The trouble we used to have with you two. It makes me feel quite old when I see the captain here, who was only a boy yesterday.'

'I was very nearly calling upon you this afternoon, only I did not like to disturb you,' Frank replied. 'Mind, I am not asking out of an impertinent curiosity, but I should like to know who the young lady in black is—the one who paid you a visit this morning?'

'This is a chapter out of an unwritten romance,' Ethel explained. 'The wounded hero present before you; the gently nurtured girl who braves a foreign clime to nurse the prostrate warrior. The brave soldier recovers, and seeks his nurse; but she has disappeared. In plain English, Frank thinks in the fair visitor of yours he has discovered the girl who, he maintains, saved his life.'

'There is not a doubt of it,' said Frank, with a warm flush upon his cheek. 'Have you any objection to tell me her name?'

'Not in the least, my dear fellow. That was Miss Charlesworth, the only daughter of my very dear friend and client, Mrs Charlesworth, of Fernleigh.'

'And her name is Gladys?'

'Perfectly right. Gladys Violet, to be correct.'

'Then it is a romance,' Ethel cried enthusiastically. 'Is it a fact that she went to Africa to nurse a wounded brother?'

'Perfectly true, my dear,' Mr Heath replied more gravely. 'It was impossible for Mrs Charlesworth to go, so she went almost alone. Conventionally speaking, perhaps it was not quite'—

'Oh, bother conventionality!' was the abrupt reply. 'It was a noble thing to do. How many girls would have dared to do the same?—The name seems familiar to me. I fancy Colonel Sandhurst told me something'—

'That he had bought Fernleigh, perhaps?'

'Oh yes; I remember now.—Mrs Charlesworth has got into difficulties over some wretched law business, and is compelled to sell her house. What a pity it seems, and such nice people, I hear!'

'It is a very old story,' Mr Heath observed bitterly. 'There is a large sum of money in dispute, which is claimed on a young lady's be-

half by her friends. You see, Mrs Charlesworth's grandfather, Martin Hay'—

A sudden exclamation from Miss Morton cut short the conclusion. 'Why, you are talking about my very own case. If I am right, then Mrs Charlesworth and myself must be related.'

'You are the Miss Morton, plaintiff in this action?' asked Heath helplessly. 'Why did I not guess as much before? Of course, Martin Hay was your great-grandfather, and but for the missing assignment'—

'Oh, I am tired of hearing about that wretched document; in fact, reprehensible as it seems, I have not taken the slightest interest in the proceedings. Do you think there was any such paper?'

'Certainly, because I once had it in my own hands.'

'If it can be found, I have no right to any of this money?'

'Not a penny of it. But as it can't be found, and there seems to be no prospect of its turning up, you are legally entitled to all.'

'Legally? But what about morally? And I have more than enough now.'

Frank, who had been listening in lost amazement to this, to him, inscrutable mystery, at this point asked for an explanation. In a few words Mr Heath told the whole story, touching briefly but clearly upon the strong attachment Mrs Charlesworth had for her old home. For a time there was a dead silence between them.

'Ethel, what do you think of it?' Sandhurst asked presently.

It was too dark by this time to see the girl's face. She did not reply for a moment, and when she spoke there was a strange catch in her voice, as if she enunciated her words with difficulty. 'I think,' she said slowly—'I think that, if I have a voice in the matter, Fernleigh will not change hands just yet.'

THE MILK-INDUSTRY IN CHESHIRE.

THE county of Chester has long been conspicuous as a chief centre of the milk-industry in England. The total area of land and water in the county is 705,493 acres, and in 1887 it contained 103,587 cows and heifers in milk or in calf. Of permanent grass, exclusive of heath or mountain land, the county contains 363,021 acres, of which 254,864 acres are in pasture, the remainder being mown every year for meadow-hay. Lancashire, Somersetshire, and the West Riding of Yorkshire have each a larger number of cows, and are noted for the production of milk; but they have a much larger area than Cheshire, and not so many cows in proportion. Derbyshire is less extensive, and contains fewer cows, but has taken a prominent place in the production of milk, and now furnishes a large proportion of the metropolitan supply.

In Cheshire, the milk-industry includes the making of cheese, butter, and condensed milk, besides the sale of sweet milk, which has greatly increased in recent years. Within the past twenty years the trade there, as in other counties, has undergone a quiet revolution. The sale of milk

to towns and cities has enormously increased; while the making of cheese and butter has been largely transferred to factories. In other days, the dairy-farm showed a busy round of cheese and butter making; and the work was all performed, or at least carefully superintended, by the farmer's wife or other female relative. The farmer himself worked or superintended on the farm outside; the matron was uncontrolled in the management of the cowhouse and dairy. Often the duties of the wife were heavier, more monotonous, and less attractive than those of the husband. No doubt the work was well managed, and it was a point of honour to produce a most excellent article; but the toil was hard, and the work altogether sloppy and uninviting. It also required constant attention, often interfered with other family duties, and was considered to be only indifferently remunerated. To become the wife of a dairy-farmer required a certain amount of courage; and for similar reasons it was not easy to obtain dairymaids with sufficient activity, as girls disliked the constant confinement and drudgery.

A change in the system began twenty years since, and has extended gradually to all the milk counties. Cheese-makers were threatened with strong competition from America, where the factory system had been established, apparently with good results; and it was judged necessary to try the same method in England. A meeting of landlords and tenant farmers, members of the Derbyshire Agricultural Society, was held in 1869, when a Committee was appointed, and a guarantee fund formed, with a view to the establishment of one or more cheese factories. One was constructed at Derby, and another at Longford, in the same county; over the portals of the latter were inscribed the words, 'This is the first Cheese Factory erected in Great Britain.' Advocated though it was by able agricultural writers, the system did not spread rapidly; but in three or four years, twenty or thirty factories had been established, chiefly in the midland counties. In 1881 there were twelve in Derbyshire alone; and a number have been added since. Among those lately erected is one at which the milk of three to four hundred cows is made into cheese. Another is designed to turn out all kinds of dairy produce. Milk is bought by weight, not by measure, and the cream is at once removed by a Laval separator. The separated milk is sold in cans to dealers, or retailed at the rate of one penny per quart, along with new milk sent out to the towns and villages of the district.

Nothing in connection with the milk-industry is more remarkable than the great increase in the sale of milk itself. Facilities for this have been afforded by the opening of railway communication; and in other respects the carriage of milk has been made more safe and easy. One recent improvement has been the power to artificially destroy animal heat and odour by refrigeration; in consequence of which, milk may be carried any reasonable distance and delivered perfectly sweet. Some figures connected with Derbyshire will serve to illustrate the great increase in the sale of milk. The quantity passed along the Midland Railway in 1872, chiefly to London, was estimated at 940,000 gallons; but in 1880 it had

reached five and a half million gallons; and in the twelve months ending with October 1888 the quantity was 8,343,292 gallons. It is carried by fast and by slow trains; and, where necessary and the traffic is sufficiently important, special trains are run for the conveyance of milk. The consumption of milk in London is enormous, but the demand is capricious; and arrangements must be made with a view to have an adequate supply without waste. On a hot day in summer any quantity of milk can be sold in London. A general holiday, or any great public event that keeps working-people at home, and gives them leisure for a good breakfast, will increase the demand; and for a similar reason, the consumption is large on Saturday and Sunday. Vast quantities are used by vendors of ices with their barrows at the corner of every street. With a view to keep matters in hand, maintaining a sufficient supply, and yet not having a quantity of sour milk on hand, wholesale dealers have begun to work their traffic in conjunction with a cheese factory, which they usually manage to establish near a railway station, and within easy communication by telegraph. The probable wants of their customers for the day can be ascertained early; and if more is wanted, a telegram can get it sent by the next train; while the cheese-making for the day can be regulated to suit the quantity of milk on hand at the factory. The increased sale of milk is beneficial to all concerned. The railway company finds the traffic so important and remunerative, that milk-vans have been provided, and even special trains run for its conveyance. For London, with its four millions of people, it is of vast consequence that milk can be so easily brought a distance of a hundred miles and upwards, especially now that, in counties nearer the city, so much space is devoted to market gardens and the production of other perishable commodities. To the farmers, also, it has been a decided benefit, and one farmer in Derbyshire candidly confessed, some time ago, that 'it had been the only thing that had kept him on his legs.'

The manufacture of cheese and butter will probably be increasingly done in factories. Their progress hitherto has not been rapid, nor have they been always financially successful. Cheese made in the factories at first was by no means perfect; and the price, though higher than the average, was considerably under that of the best makes. By experience, however, the management has been perfected, and now the quality is so satisfactory that the produce of certain factories takes a high place at Cheese Exhibitions. The character of the system may be illustrated by some statements regarding a Cheshire factory conducted on the co-operative principle. There are twenty-four farms represented, including five hundred to five hundred and fifty cows. The largest contributor has one hundred and fifty shares; the smallest has only four. On the formation of the Company, a suitable site was selected, not more than three miles from any of the farms; a long lease was obtained, and suitable buildings were erected. The whole number of people required to deal with the milk of five hundred and fifty cows consists of two men and two women, with an additional man to look after the pigs, of which one hundred and fifty to one hundred and sixty

are kept in the height of the season to consume the whey. Milk is sent in from all the farms, and is weighed on its arrival, ten pounds weight generally corresponding to a gallon. The evening milk is placed in a cheese-vat as soon as it arrives, and is prevented from setting by the action of a stirrer, which is worked by a small water-wheel. The morning milk having been added to that received the previous evening, cheese-making begins for the day. In private dairies, the milk is scarcely heated except by adding the warm milk of the morning to that which has been kept from the previous evening; but in factories it is raised to eighty-four degrees or even one hundred degrees when the rennet is introduced. A little over ten pounds of milk is required to make one pound of cheese, except in autumn, when the milk has a greater body, and eight pounds will suffice.

A weekly return shows the quantity of milk received from each contributor morning and evening on each day of the week, the total number of pounds received at each meal, and the number of pounds of milk used at each making of cheese. Every contributor is supplied with a pass-book, having lines for the days of the month, and divisions for the morning and evening milk. On the cover is a particular request that the book be sent to the factory at the end of each month to be compared with the milk ledger. Payments are made monthly to the contributors at the rate of sixpence a gallon; and the balance, after making allowance for depreciation and working expenses, is afterwards divided according to the quantities supplied from each farm.

The plan of cheese-making at the factories differs in certain specific points from the ordinary Cheshire method; and as one result of the new system, the cheese matures more rapidly. It is ready for the market in five or six weeks, and has sometimes been sent out within fourteen days after it was made. Cheshire cheeses usually weigh about twenty-five pounds, and are generally, but not always, flat-shaped, as that kind suits best for the market in London, Birmingham, Newcastle, and other places. Another great point in favour of the factory system is the saving of labour, anxiety, and risk of failure at the different farms; and the quality of cheese, which is usually made on the Cheddar plan, is more uniform, though it does not equal the highest quality of home-made cheese.

One milk-industry in Cheshire is the manufacture of condensed milk. At one factory, which takes large quantities of milk from farms within a radius of eight miles, about one hundred and twenty hands are employed. The milk is bought by weight, 10·30 pounds being the standard per gallon; and the factory can deal with six thousand gallons per day, and works all the year round. In summer, when milk is abundant, the factory presents a very animated scene. Carts in quick succession come driving up to the weighing-house, the cans are emptied into a large receiver, the weight entered, and a sample of the milk taken, so that the quality may be ascertained. When milk is below the standard in quality, a complaint is made, and if no improvement follows, the milk is refused.

The condensation takes place with or without salt, according as the article is required for

keeping or for immediate use. The milk that has been received and weighed is conducted by pipes into tanks, whence it passes into milk-cans, placed in water heated to a temperature approaching the boiling-point. After remaining about twenty minutes, it passes into large coppers with steam-jackets, where it is kept for a short time, and sugar is added if required. The milk is then passed into vacuum pans, where the proper proportion of water is discharged as steam, and condensed in coils of pipes, over which water trickles. At this point in the process, great care is required, and samples are frequently inspected. When the proper degree of condensation is reached, the fluid is run into a series of cans, which are made to revolve slowly in running-water. The making of the cans, soldering, filling, and closing, are chiefly done by girls and boys, who are supplied with very ingenious machinery for the work. As a rule, the whole process of manufacture is completed at dinner-time, after which the whole apparatus is thoroughly cleansed, preparatory to the work of the following day. The churns are cleansed by subjecting them to a jet of steam. No work is done on Sundays; the milk of Saturday night and Sunday morning is retained at the farms, and either churned for butter or made into cheese. On the third of each month, payment is made to each contributor for the previous month's milk.

A not unimportant contribution to the total supply of dairy produce is furnished by the wives of working-men. In Derbyshire, according to a recent Parliamentary Return, there are 4053 garden allotments attached to cottages held by labourers and working-men at an average rent of £5, 3s. 7d. including the cottage. Many occupants of these cottages keep pigs and poultry, and some of them keep cows. Labourers who live in villages adjoining the park at Chatsworth are permitted to pasture their cows within the park for twenty-one weeks from May till October, at a charge of three pounds for each cow. In this way some cottagers keep one cow, some two, and others as many as three or four. From the milk of these cows butter is usually made, and there is a good demand for it to meet the wants of tourists and visitors during summer. Sometimes three or four families join, and take their turn in making butter from the conjoint produce, each keeping back sufficient for the family wants. To protect themselves in case any cow should die, these cottagers are generally members of some Cow Insurance Club.

The factory system, or associated dairying, has been largely developed in the United States and Canada in recent years. The first factory was established in the State of New York in 1860, and so successful was it, that there were nearly five hundred in operation in the same State within six years. The system spread throughout the other States, and what became known as the 'American system of dairying' was introduced, as we have seen, into England, Sweden, Denmark, Switzerland, and Holland. The introduction about 1872 of oleo-margarine, a preparation of beef-fat, into the system of cheese and butter making has damaged the American dairy business not a little. American dairy cheese is made under the well-known Cheddar system. In 1880 there were 3932 cheese and butter factories in the United States; in 1888 the number had increased

to five thousand, creameries having increased most largely. The butter made at some of these creameries, from its even qualities, commands a larger price than farm dairy butter, sometimes one shilling and eightpence to three shillings a pound.

A PROPOSAL BY PHONOGRAPH.

TOM DOUGLAS was young, good-looking, and would some day be well-to-do; but above all things he was scientific. His passion for science first became noticeable when he began to learn chemistry in the Fourth Form at Halstone School. Tom and all his class-fellows were deeply taken by the weird and unearthly odours, the terrifying explosions, and the miraculous bursts of subaqueous fire which appeared at the will of Mr. Stubbs the science master. Indeed, they endeavoured persistently to emulate their tutor's exploits; but even the tutor's performances were presently quite eclipsed by those of his promising pupil Tom. The boy had a perfect genius for explosions, so that it soon became customary among the others, during the two or three hours which they spent each week in the laboratory, to give up any little enterprises of their own and simply keep an eye on Tom's movements. It was usually worth their while, for he rarely failed to do something marvelous.

When the end of term came all the youth arrived at his home in Dulberry, he set off at once on a tour of inspection round the home premises. A small building, which belonged to the gardener, and was used by him as a store-house for seeds, flower-pots, and other things appertaining to his craft, struck his fancy. He found no difficulty in persuading his too complaisant parents to make this room over to him; and notwithstanding the murmurs of Sandy the gardener, it was forthwith emptied of its horticultural contents, fitted with benches, shelves, and a fireplace, and generally rendered habitable. Chemicals also, and all kinds of apparatus, were ordered from London. Had his friends not been altogether ignorant of the science of chemistry, they would have noticed that the chemicals which Tom ordered, and for which they blindly paid, were chiefly of the kind which go to make up explosions. Almost as soon as the laboratory had been fitted up, the goods arrived from London. On the first day, nothing worthy of note was seen or heard, Tom being too busily engaged in arranging and admiring his treasures to begin experimenting with them. Soon, however, the household began to listen with mild toleration to the loud explosions which, at intervals of about an hour, were constantly heard from the direction of Tom's laboratory. They were not quite so tractable, however, when the embryo chemist, tired for the moment of noises and turned his attention to the production of unpleasant odours. But even then the boy was quite safe from interruption. They were not likely to attempt to approach the source of odours by which they were already almost stifled; whereas Tom revelled in the malodorous products of his experiments, and behaved, in an atmosphere reeking with the most abominable gases, as if he were once more

breathing his native air after a long and painful period of exile.

His love of science grew stronger, if a good deal more rational, as years passed by. At last, when he went up to Oxford, another room was added to his den. This was furnished after the manner of the average undergraduate's rooms, and here he kept his personal property and did most of his reading. Like most science-men, he was fond of novels, and of these this room soon contained an extensive and catholic collection. But the course of true love never did run smooth, and at last Tom Douglas discovered that there was one thing which, struggle as he might to ignore it, was beginning to interest him far more than any of the sciences to which he had hitherto devoted himself. His father's brother had many years ago emigrated to Australia. Almost immediately, he had married; but after a few years of hard struggle against poverty, his wife had died, leaving to him a little daughter, Dora. Tom Douglas was in his fourth year when he heard from home that his unknown uncle was dead. His father had received a letter some months before, saying that Dora would soon be alone in the world. She would be rich—for success had come to her father when it was too late to save his wife—and now the dying man begged his brother to become her guardian and offer her a home. Mr. Douglas had at once consented; and Dora arrived in England shortly before the commencement of Tom's last long vacation; so that when he arrived at Dulberry she had already been there for a week or two. The cousins became very good friends; and it was the image of a sweet girlish face, blue-eyed, and a little sad, which occupied Tom's mind, and caused him to neglect his science-work almost entirely.

At the end of the 'long' he went up to Oxford once more, in order to take leave of his friends and formally to take his degree, for at the end of the previous term he had gained a 'first' in Honours Chemistry. This brief absence from Dora was so utterly painful to him, that he became aware of the fact that he really was very much in love with her. Of course, he ought to have known it before; perhaps he had done so, but at least he had never acknowledged it to himself. At any rate he made haste to get back to his home.

When he returned to Dulberry he carried with anxious solicitude a box, which appeared to contain something at once very fragile and inestimably valuable. Dora had taken a great interest in his scientific studies—or rather, he had revived for her benefit his boyish interest in explosions. After lunch, therefore, he told her that during his absence he had spent a few days in town and there had secured a scientific wonder, which she must examine. He took the box under his arm, and they went together to his sanctum in the garden. Arrived there, he opened the box and took out a piece of mechanism which he said, was a phonograph. He showed Dora how a thin plate of mica, moving with the air vibrations caused by the voice, set in motion a small stylus of steel, and how this stylus marked out its vibrations on a thin cylinder of smooth wax, which, by a screw arrangement, was caused to move at once in the direction of its length and around its axis. Then he shifted back the

cylinder into its original position, so that the point of the stylus rested at the beginning of the little channel which it had already marked out on the wax. Finally, turning the screw again, he set the cylinder in motion; and the stylus, travelling along the line it had traced thereon, vibrated as it had done in the first instance. By this means the mica was once more set in vibration, and as it communicated its vibrations to the air, the original sounds were once more reproduced.

Tom tried to persuade Dora to sing a song; but the presence of that silent recorder made her nervous, and she was content with listening to the repetition of some trite and rather disconnected remarks of his own. The next few days passed not quite happily for Tom Douglas. He was in love, deeply in love, with Dora; but he did not dare to tell her as yet the secret which was nevertheless betrayed to her keen sight by his every word and action. He spent a good deal of time alone in his study, and amused himself after a rather silly fashion with the phonograph.

One day he had gone off on a visit to some friends, and Dora was feeling lonely and a trifle *ennuyée*. Her cousin had begged her to borrow any of his books if at any time she wanted something to read, and she went down to his study to get one. As she went, she was thinking of him, and wondering why he still hesitated to ask her the simple question which she would so gladly answer—the question which he was so constantly asking himself, and to which his love and his humility both gave different answers. She had chosen a book, when her eye fell on the phonograph lying ready for use on a table. Now that she was alone, she thought it would be rather pleasant to try how her own voice sounded. She had read lately in one of the newspapers that people had no idea of what their voices really sounded like; and she rather wondered whether her singing, of which she was inclined to think highly, was really so good as she had imagined. Filled with dread lest the unflattering phonograph should prove to her that her voice was harsh and unpleasant, and not quite decided as to what song she should try, she began to move the treadle which set the cylinder in motion. What sound was that which fell upon her ears? Her cousin's voice was speaking to her; and after a moment of ~~stark~~ astonishment, she listened with a quiet smile, as though Tom were standing before her in the flesh and saying what the phonograph now said for him. This is what she heard: 'Dora, darling, I have loved you ever since the day when first I saw you! I have longed to tell you every day since then, but have always been afraid. Will you try to love me just a little?' The voice lapsed into silence.

With a sudden gladness, Dora saw what had happened. Her cousin had also wondered how his voice sounded to others—to her—and especially how the question would sound which he so longed to ask. Well, the voice struck her as awkward, constrained, and quite unlike the cheerful tones to which she had become accustomed; but the words—

At that moment she heard her cousin's voice at the other end of the garden. He had returned home unexpectedly, and was chatting with the

gardener. He would be here presently, no doubt! In a moment she had once more set in motion the cylinder of the phonograph, and bending over it, spoke a few words in a low clear voice. Then she shifted the cylinder back into its original position, and stepped quickly into the next room—the laboratory.

In a few minutes she heard the conversation between Tom and the gardener cease. The young man came quickly down the garden and entered his sanctum. He hung his hat and walking-stick upon a chair, and then the phonograph struck his attention. He moved towards it and stood looking down on it, with his back towards the door of the room whence Dora was eagerly watching him. Then he began absent-mindedly to set the treadle in motion. One more the phonograph spoke, and as it did so, Dora moved silently forward and stood in the open doorway of the laboratory. 'Dora, darling, I have loved you ever since the day when first I saw you! I have longed to tell you every day since then, but have always been afraid. Will you try to love me just a little?'

Tom heard these words; and then, before he had moved his foot from the treadle, the phonograph spoke in another voice: 'Why should you be afraid to come and ask me, when you know'—it was Dora's voice; and even while he wondered at this marvel, he heard the same voice speaking again. 'Tom!' said the voice; and turning, he saw his cousin, standing with half-parted lips and laughing rosy face, only a yard or two away from him.

'Dora!' he cried, 'you have learned my secret!'

Dora moved towards him and hid her face in his shoulder; then, as he raised and kissed it, she whispered: 'Yes, Tom, long ago!'

MORAL COLONISTS.

As we ramble along our country lanes or saunter by the side of our rushing rivulets we are struck by the almost infinite variety of wild-flowers which bespangle the grass, cluster in the hedgerows, or bend over the water; or even if we go no farther than our own gardens, we are well aware that multitudes of plants, with leaves and flower of usually a rather ragged appearance, and which we designate weeds, grow vigorously and rapidly, and would soon, but for the assiduous labour of the gardener, thrust out the flowers which we have so carefully tended.

Now, the greater part of these wild-flowers and weeds are the true children of the soil, natives who have held the ground from time immemorial, and have reigned in undisputed right, until man's heavy cultivation overturned their empire and forced them to yield to other plants, which, though less adapted to the situation, afforded greater advantages to himself. But others, though growing among the wild ones and apparently native, are not aborigines; they have come as colonists, introduced by the hand of man, either designedly or otherwise, and intruded themselves among our native plants. Some of these have been residents of our country for ages, and have thoroughly

established themselves; others, although of recent introduction, have increased with such rapidity that in large tracts of country they have gained a permanent footing; while a third class only show themselves sparingly and locally, and can scarcely be considered naturalised. In this short paper we purpose directing your attention to a few of these floral colonists which from time to time have been introduced into our native land.

It is no easy task always to decide whether a plant is a true native or whether it is merely a colonist. In a very few cases we have the date of a plant's introduction; but in the vast majority of instances this is unrecorded. But if a plant is known to have been in cultivation for centuries, and is found only in the neighbourhood of houses or on the borders of cultivated fields, while in the corresponding latitude of Europe it is wanting, we may be very certain that it is only a garden escape.

To the monks, who in their way were great gardeners, we are indebted for the introduction of several plants; and since in many cases the ancient monastery has disappeared, the flowers which were wont to grow in its garden are often taken for wild ones. Among others, the Snowdrop was a favourite flower in a monastic garden, for it was sacred to the Virgin Mary; and in many a shady dell, especially in the west of England, where not a stone of the old convent appears, the snowdrop still blossoms in the spring, telling us of a vanished garden. Its native home, however, is on the Alps. Another plant, too, they brought from the mountains of Central Europe, a species of dock (*Rumex alpinus*), Monk's Rhubarb. No beauty of bloom or of foliage recommended it, nor did any mystic legend enshroud its history; but its root possessed medicinal qualities, and the monks well understood the healing virtues of herbs. It is now found in many places in the north.

But not only from monastic gardens, but also from the cottager's little plot of ground, many flowers which were grown for their beauty, or herbs which were planted for culinary or medicinal purposes, have been disseminated far and wide by means of wind or bird, and may now be found apparently wild in many localities.

The Yellow Fumitory (*Corydalis lutea*) may be often found on old walls in various parts of the country. It is a plant nearly related to the common fumitory, with largish, yellow, irregular flowers, and pale, glaucous, glabrous leaves, which have anything but a pleasant odour; but it is only a garden escape, and is never found at any great distance from houses.

The Common Pink (*Dianthus plumarius*) and Clove Pink (*D. caryophyllus*) are found, though rarely, on old walls in districts where they have been formerly cultivated; and even the Cheddar Pink (*D. cæsius*), which has been for years considered indigenous to the limestone rocks of Cheddar, in Somersetshire, is now considered by some authorities to be a garden outcast. The Wallflower, which is found on rocks and walls in many parts of the country, and which makes the St Vincent Rocks at Clifton, in the spring-time, golden with its bright yellow blossoms, while the air around is laden with its sweetness, is by some considered merely naturalised; while, curiously enough, the Stock, which is seen but

rarely, and then mostly on old castle walls or similar situations, is supposed to be a native.

The Periwinkle, a native of Southern Europe, which is a favourite plant on rockeries on account of its trailing stem and evergreen leaves, may sometimes be met with along our roadsides; but since it is propagated mainly by its rooting stem, and seldom, if ever, ripens its seed in our northern clime, it cannot be indigenous.

On walls, especially in the west, a common plant is the Ivy-leaved Toad-flax (*Linaria cymbalaria*). Pretty it is too, with small lilac blossoms like tiny snapdragons, which are produced in such profusion that in many parts of the country it goes by the popular name of Mother of Thousands; but though it is so abundant that it covers many walls with a bright green drapery bespangled with myriads of starry flowers, yet it is with us only an introduced plant from the south of Europe, and has been originally planted, even in those places in which it is most abundant.

The real Snapdragon (*Antirrhinum majus*), which, with its bright showy flowers, is such a gay ornament in most cottage gardens, is sometimes met with, strayed away from the spot in which it was cultivated, and adorning the dreary hedgerow or quarry edge. When found in such situations, its blossoms are almost invariably red, though, when under cultivation, they vary with almost every conceivable shade or colour. Down by the rivulets of Warwickshire and of other parts of England, an American plant, the Monkey Flower (*Mimulus lutea*), may often be seen. In every case it must be naturalised, though the seeds have often been carried by the stream to a considerable distance from the garden to which they owe their origin.

The preceding have escaped from the flower garden; but the kitchen garden has also its outcasts. Parsley is often found on cliffs and rocky places. On St Vincent Rocks, Bristol—that happy hunting-ground for botanists—it is found abundantly; and on many limestone hills even in the inland counties it may be met with. The wild pear, which is so common a feature in the hedgerows of Worcestershire and Herefordshire, is now generally supposed to be the degraded remnant of a former cultivation. Even the medlar, which has often been quoted as a true English fruit, has been by some authorities lowered to the rank of a garden escape.

All plants which are propagated by means of runners are peculiarly liable to stray from the spot in which they have been planted; the Strawberry is therefore sometimes met with away from its bed, but is by no means common. A notable instance of this is the Common Elm, a tree which constitutes one of the leading features in English scenery; but it is certainly not British, for the seed never comes to maturity in our northern clime, and has in every instance either been planted or sprung from a sucker coming from an older tree. It has now been one of our forest trees for many centuries, and is perhaps the commonest. Another plant which is often found in England, but rarely ripens its seed, is the horse-radish, which may often be seen down by river-banks, or in waste places where garden rubbish is thrown. Any one who knows the extraordinary vitality of its root, and

the way in which a small portion of root will grow, will be at no loss to account for its appearance.

All these plants have, however, been introduced purposely and designedly; man has brought them over to his native land either for the sake of their beauty or from some utilitarian reason, and we have no reason to be sorry for their residence in our midst; but others have been introduced unwittingly and involuntarily, and their introduction has proved a curse rather than a blessing. Such are the numerous weeds whose seeds from time to time have been carried over from foreign countries with grain or other seeds. All the poppies whose scarlet blossoms look so beautiful in a cornfield have probably come over in the first instance in that way; and though we may admire the manner in which their colour agrees with the golden corn, the farmer would be only too glad if their seeds had never landed from Southern Europe. The Field Crowfoot (*Ranunculus arvensis*), a straggling weed, with smallish yellow flowers, and easily distinguished from the other crowfoots by its large flattened achenes, which are covered with bristles, was introduced also from the south; and many of the cresses and other cruciferous plants can boast of a similar origin.

North America has sent us the Water Thyme (*Anacharis*), which, though first discovered in this country so recently as 1842, has made such rapid advances that there is scarce a canal, river, or brook in the country but is infested with this troublesome water-weed. It rarely comes above the surface, flowering under water, and is readily known by its pellucid leaves, which are arranged upon a simple stem in whorls of three.

Kew Gardens, too, have let out some of their botanical specimens to the disadvantage of the neighbouring farmers. First of these stands a South American plant, a native of Peru (*Galinsoga parviflora*), a plant belonging to the great order Compositæ, with broadly ovate opposite leaves, and small heads of flowers. The ray flowers are small and few, about six, white and broad; and the tubular flowers are yellow. This plant is already a great nuisance in the various gardens and cultivated land in the parishes of Mortlake, Richmond, &c., and is rapidly spreading. A Russian plant, too, of the Balsam family, with small inconspicuous flowers, has also escaped, but does not appear to spread very rapidly; while a third offshoot from these Gardens is seen in that curious plant from North America called *Claytonia perfoliata*. It belongs to the order Portulacæ, has thick succulent leaves, of which the radical ones are ovate, and on long stalks; while the stem ones uniting, form a single leaf, through which passes the stem, which bears a number of minute white flowers. The seeds are black and shining. We have found this as far distant as Eden Park, in Kent.

These are but a few examples of naturalised plants; many others might be cited, but they are mostly only naturalised in small quantities and in limited localities. Many others, too, which now adorn our gardens, and are cultivated among our fruits and vegetables, may as the years roll on be registered among our wild-flowers; while, alas! some of those which have been long cherished among our woodland blossoms may become ex-

tingent. Primroses and violets, oxlips and orchids, are gradually decreasing; but may the time be long in coming when their haunts shall know them no more!

I D Y L.

In the valley of the Wye,
Clear and low the cattle-cry
Echoes o'er the meadows still,
Till it spurs the baby-fect,
Truant in the village street,
From their supper at the Mill.

To the stile beyond the cool
Shadowed waters of the pool,
That the freshets flush and fill,
Every eve in sun and shade,
Strolls a farmer down the glade
From his holding on the hill.

Skirting close the woods of pine,
Meekly step the foremost kine,
Till they splash the swollen rill.
Ankle-deep in herbage lush,
Follows with a deepening flush
Maiden Maggie of the Mill.

Gold the rippled locks beneath
Hat and honeysuckle wreath—
From her garden at the Mill;
While her wistful eyes of blue
Seem as glints of heaven's hue
To the watcher from the hill.

Springing with a blithe 'Good-e'en,'
From his stile above the green,
Downward hurries Farmer Will;
While the patient milky band
Long in water-eddies stand,
Drinking each a lazy fill.

Every evening her surprise
Deepens, as the blushes rise,
At their meeting by the rill.
Must he always watch the yield
Of that long ten-acre field,
As she passes to the Mill?

But he tells, with lover's art,
Of a lonely home and heart,
On a holding up the hill;
And the cattle homeward stray,
While they linger on the way,
Miller's maid and Farmer Will.

For a maiden will delay,
And it takes so long to say
In a lover's ear 'I will.'
And the children wait and wait
Till the hour is growing late
For their supper at the Mill.

A FORGOTTEN POEM.

ONE of the most famous poems of the sixteenth century was *The Sphere* of the celebrated Scotsman, George Buchanan. It would now be impossible to name a poem more completely forgotten. Yet, as a curious chapter in the history of taste and opinion, a brief account of it may not be uninteresting.

The poem owed its great reputation to two circumstances. It was written in Latin, then the language of educated Europe, and in verse which, in the judgment of the best scholars of that day, rivalled that of the great Latin poets of antiquity. In the second place, it treated of a subject which, at the time the poem appeared, was exercising all instructed minds—the new theory of Copernicus. The epoch-making book of Copernicus, in which he announced his discovery of the earth's revolution round the sun, was published in the very year of his death, 1543. From the first, his theory was received with contempt, and by none more than by the great scholars of the sixteenth and seventeenth centuries. The reason for their contempt may be simply enough explained. It was still the time of the revival of letters, and the wisdom of the Greeks and Romans was deemed beyond appeal. But these Greeks and Romans had in their wisdom adopted the theory known as the Ptolemaic, in preference to that associated with the name of Pythagoras, who, as is well known, is credited with having anticipated Copernicus. When the modern astronomer, therefore, came forward with his so-called new theory, they regarded it simply as an exhibition of confident ignorance. This contempt on the part of those who led the opinion of educated Europe, taken together with the scruples of the Church, explains how it was that nearly two hundred years elapsed before even learned men had assimilated with their daily thinking the fact that it is the earth that revolves round the sun, and not the entire heavens round the earth. Milton's *Paradise Lost* was published in 1669, more than a hundred years

after the appearance of the work of Copernicus, yet Milton's poem is based on the Ptolemaic theory that the earth is the centre of the universe. Milton was perfectly aware of the rival theories, and has certain interesting passages in his poem in which he states the respective arguments for both. Nevertheless, his deliberate choice of the one in preference to the other would seem to show either that he was himself convinced of its superior claims, or that he regarded the older belief as better adapted for poetical treatment. But even as late as 1711, Addison, in his well-known hymn published in the *Spectator*, says of the heavenly bodies:

What though in solemn silence all
Move round the dark terrestrial ball?

We must not, therefore, regard it as a proof of mere blind dogmatism on Buchanan's part that, some fifteen or twenty years after the death of Copernicus, he should have written a poem for the express purpose of combating that great astronomer's discovery. At the time he began to write it, Buchanan was acting as tutor to a son of one of the great marshals of France, and it was for his pupil's edification that the poem was in the first place intended. It is written in Latin hexameters, and is divided into books, each dealing with a different part of his subject. Buchanan meant his poem to be the great work of his life, and, according to the original plan, it was to rival in length the great epics of antiquity. Old age and infirmities, however, prevented its completion, and he left only five books, of which the last two are incomplete.

It is the first book of the poem which is especially interesting, as it deals expressly with the recent teaching of Copernicus. It is strange for us now to read how the great scholar solemnly adjures his pupil to shut his ears to a doctrine unworthy of man, irreconcilable with reason, worthy to be ranked only with old wives' tales. Here are a ~~few~~ of the arguments with which he seeks to make good his case. Think, he says in his magnificent Latin verse,

of the sound made by a boy's sling when whirled round his head—think of the sound made by a pair of bellows, and conclude from this what sound would be produced by the earth's moving round its own axis, with all its mountains, seas, forests, and cities! Again, if the earth revolved, and at the speed necessary to meet the case, how could any temple, house, or city be left standing? The sea, moreover, could not keep its bounds, but would rush wildly over all the earth's surface. When a bird should fly into the air, before it could descend, its nest would be some hundreds of miles from the spot where it had left it. Suppose two armies engaged in battle, the arrows of the one, indeed, would reach the enemy, but those of the other would be borne round by the earth's motion and never reach their aim. If the heavenly bodies remained fixed, he proceeds, where would be our seasons, our division of time into days and months and years? The earth *must* be the centre of the universe, otherwise the sun and the stars would vary in magnitude, whereas we know they do not.

Another interesting part of the poem is where it treats of the rotundity of the earth and Columbus's comparatively recent discovery of America. This is one of the poet's most highly wrought passages, but one at the same time that utterly confounds a modern reader by its exhibition of utter incapacity to appreciate the significance of Columbus's great achievement. Avarice, he exclaims, is at the bottom of it all, and the opening up of new lands has led to nothing but increased misery and vice. Better far for mankind had keel of ship never ploughed the sea! The voyages of Spanish and Portuguese navigators had of course, by Buchanan's day, put the rotundity of the earth beyond question. But it is evident that he was quite of opinion that Providence would have dealt more kindly with man had the earth been made square, as in that case narrower bounds would have been set to his avarice and lust of dominion.

In other parts of the poem we find the generally accepted beliefs of Buchanan's day. Above the moon, everything is changeless and everlasting; below it, everything is in a state of interminable war. The four elements arrange themselves according to their respective densities—lowest is earth, then water, air, fire. All these elements tend towards the centre, and this explains the rotundity of the earth. The earth and the entire universe must needs be round, because this shape most directly suggests perfection and infinity. The poet cannot think that Epicurus was right in teaching that the sun and stars by coming in contact with the earth are extinguished, and when they pass from this contact are re-illuminated. The phases of the moon, he thinks, disprove this explanation, as, on Epicurus's theory, all the heavenly bodies ought equally to pass through these phases.

Enough, perhaps, has been said to show what notions satisfied the most enlightened minds of Buchanan's age regarding what we nowadays call 'the elements of science,' and further, how, when the truth was laid before them, they deliberately rejected it. It is certainly a strange instance of the irony of life that a man like Buchanan, undoubtedly gifted with real poetic genius and

accomplished in all the learning of his time, should have dreamt that by such a poem he made himself sure of enduring reputation. It will be remembered that Milton at one time had thoughts of writing his great poem in Latin. Had he done so, would *Paradise Lost* be now a whit better known than the *De Sphæra* of Buchanan?

JOHN VALE'S GUARDIAN.

CHAPTER XXV.

IF Robert Snelling had not already fallen into monomania, he was at least rapidly on the way to it. The shadow of his ward obscured his mental sky from horizon to horizon, and wherever he looked he seemed to see nothing else than that. First and foremost, the boy had profoundly injured him in daring to be born at all. If John Vale the elder had died childless and without a will, his property would, beyond a doubt, have gone to Snelling. Even if he had made a will, he had had nobody else to whom to leave his belongings, with the exception of an inconsiderable legacy or two. In the next place, young John had done him immeasurable wrong by recovering from that blow upon the head, which had at one time promised to bring about such excellent and desirable results. Apart from these things, which, to do him justice, he looked upon as being injuries of the negative sort, the boy had inflicted all manner of positive wrongs upon him. It was through him that that part of the county was alive with scandalous stories concerning his guardian's cruelty, and through him that half Snelling's acquaintance gave him the cold shoulder in street and market. If it had not been for John's disappearance, he would never have left his prosperous business in Castle-Barfield, and though he had sold it to advantage, he knew that he could have made more of it by keeping it. It was by John's fault, again, that he had lost a safe and trusted business manager. And yet once more, it was by John's fault that his accustomed housekeeper had left him to the mercies of a strange woman who did not know his ways. And yet once more, and worst of all, it was by that same malevolent influence radiating out of young John that Jousserau had met Cecilia, and had spread to her mind the scandal which had turned the balance of her fancy against him. For nothing in the world would have persuaded him that Miss Shorthouse would have given him 'No' for an answer after a fortnight's waiting but for that fancied interference.

Men lying in long-drawn agony with a wound or a broken limb have been known often enough to take a fierce pleasure in augmenting their own anguish; and Snelling, with a heart already scorched with rage and hatred, consciously heaped fuel on the flame. The very thought of the boy was like gall and wormwood to him, his name was a nausea, and the sight of him aroused a bitter and impotent passion of revolt. If he had been free to show a sign of his real feeling, his hatred might have dwindled to a merely angry and disgusted distaste; but being compelled to treat him kindly, he grew to loathe him more and more.

There was at no time an actual scheme or even a hint of a scheme, in his dull mind; but for all that he looked forward to a time when, by cunning design or happy accident, his way should be clear, and he should become the actual possessor of the property which he now merely held in trust. The solid earth itself was not firmer than his own inward conviction that had things been but fitly and properly ordered, right was on his side. The sun in heaven shone no clearer than that centre of his hateful, greedy creed. That is the singular thing about your true egotist, who, happily, is a *rara avis*. Whatever stands between him and his desire, whether it be abstract justice or a mere live heart and soul, is hateful and wholly in the wrong, alienated from the chance of having right on its side. If any one had known the workings of Snelling's mind, and had asked him plainly, yes or no, had his ward a right to his own, the mental part of him would have answered 'Yes.' But the inward man would have risen in a passionate protest against the thought. How could he have rights to what belonged to him, when Robert Snelling coveted it, and would almost die to have it?

If the way of transgressors is hard, honest folks at least have no right to be dissatisfied; and even the transgressor himself, if he did but know it, finds his one chance of safety in the whip that scourges him. The man's greed and hate left life scarcely tolerable. They poisoned his food, they distorted his mind, they shrouded him from the very light of heaven, and brought dreadful visions to his sleep. A brute had roared, so tortured; but he had to bear it all and give no sign.

He sat in the room he had made his own, brooding over a set of accounts which Isaiah's sudden dismissal had left anything but clear to him, and every now and again the one preoccupying thought returned to his mind with the irritating persistence of an insect to a sore. Isaiah's method of book-keeping had been beautifully accurate and clear so long as Isaiah himself had been there to explain it; but his records and memoranda would have puzzled a cleverer accountant than his master. In point of fact, Isaiah's system was purely of his own invention, and though the inventor had been marvellously proud of it, it was no less than a man-trap for any unilluminated successor. Whilst Snelling sat beating his brains in vain over the confused tangle of accounts before him, a rap sounded at the door, and in answer to his gruff command, his new housekeeper entered the room. She was an elderly woman of extremely plain exterior, and to judge her by her face, had spent some fifty years in the loquacious exposition of a standing grievance.

'What is it now?' asked Snelling unamiably.

'Why, sir,' began the woman, 'I'd ha' spoke to Master John about it myself, but he's gone gallivantin' off with young Master Gregg the minute as he'd swallowed his bread and milk for breakfast.'

'Well, what about him, woman?' her master demanded.

'There's this about him, sir,' the woman responded: 'he'll have we all roasted in were beds. He's reading in bed reg'lar every night, which is a practice as I can't away with nor yet

abide. He's found some sort of a old lamp somewhere, as he's filled himself from the tin in the back kitchen; and if he ain't been burned alive already, it's a mercy, and no fault o' hisn.'

Snelling was about to answer, bidding her to take the lamp away; but at that moment a knock was heard at the front door of the house. 'See who that is,' he said, 'and then come back to me.'

The personage at the door was no other than our friend Tobias. He was hatless, and had a few straws clinging to his clothes in memory of his last night's couch. The elderly but unvenerable wreck was a little uncertain as to what day of the week it was, and was altogether undecided as to the hour. He was conscious mainly of a terrible thirst and a splitting headache; but his waking hour was firm to his last resolve, and he was here to lay the news of his discovery before the capitalist who was to be his partner.

'Will you kindly inform Mr Snelling,' he said in his blindest and most oily manner, 'that a person by the name of Orme is here, and that he has intelligence to convey to him of a most pressing and valuable nature?—Mr Orme, Mr Tobias Orme, madam, on business of importance.'

He looked so little likely to have business of importance to the housekeeper's mind, that she put the chain upon the door before carrying his message to her master. She returned a moment later, however, with orders to admit him. Snelling raised his eyebrows at his visitor's appearance, and held out the palm of his hand towards him, as a sign that he was not to approach too near.

'You may go,' he said, nodding to the housekeeper; 'I'll talk to you about that other matter later on.—Now, then'—turning round in his chair upon Tobias when they were left alone—'what's your business?'

Mr Orme passed a hand across his lips, and essayed to moisten them with his tongue.

'You're a pretty figure,' said Snelling, 'to come into a respectable house.—Tell me your business, and get it over.'

'Excuse me, Mr Snelling,' began Tobias, 'my appearance is not in accordance with my prospects. I am aware of it—fully aware of it, Mr Snelling. I believe, sir, that I have every right and title to announce myself as a harbinger.'

'Have you been drinking?' Snelling asked him sternly.

'No, sir, no,' returned Tobias. 'I daresay, sir, that my appearance betokens some excitement; but it is not alcoholic, Mr Snelling.'—Snelling regarded him with a doubtful and disliking eye, but for the moment said nothing. '—I believe, sir,' Tobias continued, 'that I am the bearer of intelligence of the most striking and remarkable order. I do not believe, sir, that you have ever received such intelligence in your lifetime.'

'Well,' said Snelling, 'out with it.'

'I beg your pardon, sir, but I cannot consent to part with my secret, with my discovery, until I am assured that I shall be well treated.'

Snelling turned his chair bodily round, so as to face his visitor, and dropping one hand on the table beside him, stared him fixedly in the face. 'If you come here,' he said, 'with a drawling slowness of delivery unusual even with him—'

self, 'with any idea in your mind as you can threaten me, you're the most mistaken man as walks.'

'Threaten, sir!' cried Mr Orme; 'there is nothing further away from my ideas and intentions. I have made a wonderful discovery, Mr Snelling; I have made a discovery which means hundreds of thousands of pounds.'

'You have, have you?' Snelling answered. 'And you want half-a-crown for a drink on the strength of it? You've come to the wrong shop, my man; you can walk.'

'Mr Snelling!' cried Tobias, driven into directness of statement by the fear that the interview might be precipitately closed, 'I have made a discovery worth thousands of pounds to you—hundreds of thousands of pounds to you. There's no possibility of mistake about the affair, sir. I know all about it. In my own humble way, sir, I have been regarded as an authority upon the question.'

'Hold on,' said Snelling. 'Answer my questions. You're neither mad nor drunk, to begin with, eh?'

'I assure you, sir,' Tobias began in answer; but the other cut him short with an imperative wave of the hand.

'Either hold your tongue, or answer me Yes or No. Are you mad or are you drunk?'

'I am neither the one nor the other. I am labouring under no hallucination.'

'Now, now!' cried Snelling, seeing that Tobias was charged with further speech, 'that's enough. —You've made a discovery, you say, that may be profitable to me?'

'Profitable is hardly the word, sir,' returned Tobias. 'It opens up, Mr Snelling, visions of magnificence of which the *Arabian Nights*—'

'Hold on!' commanded Snelling. 'Stop there. —You say that this discovery is a secret? Nobody knows of it but you?'

'Not a soul seems to have had the brains to appreciate its value; but it's lying there to be seen, and may be seen at any moment. If it is beheld by mortal eye'—

'Hold on!' Snelling cried again; but this time Tobias was not to be silenced.

'If it is beheld by mortal eye'—

'Stop!' roared Snelling.

'If it is beheld by mortal eye,' Tobias insisted, 'you lose it.'

'Oh!' said Snelling, 'that's it, is it? You've seen something that lies for everybody to see. It may be worth a pile of money. M—m! It wants money to get it, whatever it is, I suppose?'

'Yes, sir. It will naturally demand a considerable outlay and expenditure.' There was silence for the space of half a minute, and Snelling sat with thoughtfully frowning brows.

'I only desire to be assured of one thing,' said Tobias. 'If it should prove to you, sir, that the intelligence in my possession is of enormous value to you, and there is not the slightest doubt of that, not the faintest doubt of it, I assure you, may I ask, sir, what you would propose to do with me?'

'I can't buy a pig in a poke,' said Snelling. 'Let me know what you've got to sell, and then maybe I'll make a bid for it.'

Tobias astonished his interlocutor, and even

astonished himself a little, by the business-like directness of his answer: 'I have a fortune to sell, Mr Snelling. I am open to an offer of a percentage on your actual gains.'

Until that moment, Snelling had not been absolutely sure in his own mind that he took Mr Orme in real earnest. 'That sounds like business,' he said, when he had turned it over; 'but I can't be buyer and seller, my man. You must put a price on things, and then I'll talk to you.'

Mr Orme began actually to tremble from head to foot, and his tongue almost refused its office. 'Will you give me a mere five per cent., Mr Snelling, on all your actual gains?'

'That sounds like business,' said Snelling. 'If you've got any information to give me that's as valuable as you say it is, you'll be well to do for a man in your position in the world if I give you one per cent. That's what I'll do with you. If there's anything in your story at all, I'll give you one per cent. on what I make out of it.'

'Four, sir,' said Tobias.

'One?' said Snelling.

'Three, sir! You ought to make it three. I am an elderly man, Mr Snelling. I am alone in the world, and I only ask it for my lifetime. Make it three, sir. I shan't last long. I am a person of—of irregular habits, and I shan't last long. Try and make it three, sir. Do, please, try and make it three.'

'One!' said Snelling once more. 'I don't believe there's anything in the story; but if there is, I'll give you one per cent. on my profit, whatever that may be.'

'I can't sell it for one per cent.,' said Tobias groaningly. 'It's worth thousands and thousands and thousands; and whilst we're talking about it, somebody else may find it. It anybody with a brain the size of a pin's head were to see it, he'd know what it meant.' He was in an actual frenzy; and Snelling, cool and wary as he was in all matters of business, began to catch fire from him.

'You know very well,' he said, shaking a heavy forefinger at Mr Orme, 'that you're not the kind of man to bring a tale like this with overmuch likelihood of being believed. If what you say turns out to be true, and I find my advantage in it, I'll pay you two per cent. on actual profits, and not a penny more. If you don't like that, you can take your story-book elsewhere, and offer it to whosoever likes to spend his time in reading it.—There you are. Take it or leave it, and let's have no waste words about it. There's not a many people of business as'll give a minute to a man of your appearance, and that you know right well. Two per cent. D'ye take it?'

'Yes,' said Tobias; 'I will take it.'

'Very well.—Now, what's your secret?'

'I must tell you in the first place,' Mr Orme began, 'that I have been guilty of a slight dereliction of duty in coming here at all. Nothing less urgent than my business would have induced me to abandon the trust reposed in me. As a matter of fact, sir, pressed by a necessity which I trust will be no more than momentary, I am officiating temporarily as a sheriff's bailiff. I was placed yesterday, at your suit, Mr Snelling, at the house of a farmer in this locality who

bears the name of Day. I respectfully submit, sir, that in deserting my post I sought your own advantage.'

'That'll depend,' said Snelling, 'on how things turn out.—Go on, and let's have as few waste words as you can manage. There's more husk in your grain than I remember to have seen afore.'

'You already have a hold on Mr Day, sir,' pursued Tobias, 'and I have no doubt that in his extremity he will be willing to sell his land at a disadvantage.'

'Well, what's that got to do with me, even if it's true?'

'The mysterious and much discussed question of the Great South Staffordshire Fault is solved, sir,' Tobias proclaimed, with a rare blending of dignity and enthusiasm. 'There is an open coal-mine in Farmer Day's back garden, and I can assure you, sir, from actual inspection that it is of the finest quality.'

'Coal! There's no coal in this country-side,' cried Snelling, rising to his feet.

'There is indeed, sir,' returned Tobias; 'and what's more, sir, I believe it's the real old ten-yard Staffordshire. It crops up to the top, and you get the edge of it. I've seen six yards of it with my own eyes, without a break, without a flaw.'

'You've told nobody of this?' Snelling demanded.

'Not a creature,' said Tobias, and, so far as he knew, he was speaking truth.

Snelling strode across the room and threw open a door. 'You get in there. I'm going to lock you up. If you've been fooling me, I shall have to deal with you for two things; and if the tale's true, I'll have no risk of your running about bubbling it.'

'I recognise your motive, sir,' returned Tobias, trembling. 'Believe me, sir, I do honour to your motive. I am willing to submit to a limited period of incarceration. But for the love of our common humanity, Mr Snelling, do not lock me up without a drink. I am an elderly man, Mr Snelling; I have been greatly agitated and excited, and a drop of something short, if I might take the liberty to suggest it, would be the making of me.'

'You'll get nothing out o' me,' returned his patron, 'until I know the truth or falsehood of this story. Get inside; and if you're thirsty, there's the water-bottle.'

There was nothing else for it, and Tobias obeyed. He was locked in, and from his prison chamber heard Snelling bustling about and shouting orders to his groom. A few minutes later he saw him pass the window on horse-back.

Snelling, half on fire with excitement, put in spurs and rode for a mile at a headlong pace; but then, fearing to betray himself by any appearance of haste, slowed down to a trot, and fought his own impatience as best he could. Nearing Day's house, he was smitten with sheer amazement to see a dozen coal-grimed fellows lounging in heavy flannels at the garden gate. He rode on until he came amongst them. 'What brings you chaps here?' he asked, looking round and addressing the company in general.

'They're come on coal this side the Fau't,' one

man responded. 'Mr Proctor's here, the big engineer from Dudley Wood. It's g'iven him the notion as this side's just as rich as t'other. It's the real old Stafford thirty foot, and no mistake about it.'

'Hold my horse, one of you,' said Snelling, dismounting. He pushed his way into the garden, walked rapidly round the house, and came upon a scene of surprising disorder. The garden flower-beds were obscured by great mounds of earth, and from one of them a half-buried fruit-tree forlornly pushed its maimed and broken branches. There was a further gang of a dozen or so of flannel-clad, coal-grimed men scattered about the mounds, leisurely eating from earthenware basins and drinking from tin bottles. He paused for but a single glance of astonishment, and walking briskly on, came in sight of Isaiah, Farmer Day, and a gentleman of quiet business exterior engaged in eager conversation.

'Hillo, Snelling!' cried the farmer. 'You needn't trouble to send the bumbailiff back again. I'll count your money down in five minutes' time from this.'

Snelling made no answer, but stood looking at the exposed surface-coal. 'You're Mr Proctor, I believe, sir?' he said after a while, turning upon the stranger, who contented himself with a simple nod in reply. 'There's no mistake about this?' Snelling waved his hand to indicate the coal.

'None in the world, sir,' responded Mr Proctor, with a strong Scotch accent. 'It's been my belief for twenty years that there's coal, more or less, under every yard of this district, and now I know it.—Ye may say good-bye to your flower-beds and cornfields, farmer; in a score of years' time there'll be no such thing in sight o' ye.'

'I've got a matter of four or five hundred acres,' said Snelling, 'within a mile of this. Freehold, down to the very centre.'

'Then, sir,' returned the engineer, 'ye deserve to be congratulated. Ye're a very wealthy man, if ye never were before.'

'That's good enough for me,' was Snelling's answer.—'I'll give you your quittance, Day, when you're ready.'

So said, so done. He rode away with his money in his pocket in crisp notes new from the bank, and as he went, a fierce, slow exultation surged through him, and was arrested suddenly. The main part of the land under which this newly discovered treasure lay belonged to his ward. There, again, the boy stood between him and fortune, and even into this cup of sweetness his hand poured gall and wormwood.

The boy was in his mind, and anything that belonged to him was welcome to his thoughts as food for hatred. When he reached home, he walked into John's bedroom to look at the lamp of which the housekeeper had spoken.

'Ah!' he said slowly to himself. 'It was the fellow to that as burnt and set fire to Mrs Winter's bedroom. This chap made the same spluttering noise, and that's why it was put away. I remember. It was thought to be dangerous. I remember.'

He walked slowly back to his own room, and by the way encountered the housekeeper. 'What about that lamp, sir?' she asked him.

'There's more safety in it than there would be in a candle,' he responded. 'Let the lad have

it. He's got a thirst for knowledge, Mrs Wilkins, and it's a bad thing to stunt a growing mind. You can give him a word to be careful on it.'

Perhaps Providence might help him.

MAORIS IN PARLIAMENT.

BY A NEW ZEALANDER.

In many respects the Maoris are a more receptive people than the Japanese. If I were asked to express the difference between the two, I should say the Japanese *imitate* European manners and habits; the Maoris *adopt* them. In the case of the Japanese we say and feel that he is merely copying us in what we do, and it strikes us that in many cases his own costume and his own institutions suit him better. The Maori in New Zealand, however, has to a large extent become one of ourselves. The visit of the Maori footballers to Great Britain will have shown how thoroughly the natives referred to enter into our national pastimes. There is no more thoroughly characteristic English game than football. We all know the feeling of half amusement, half disgust with which it is regarded on the Continent. Yet there is no game into which the Maoris have entered with more gusto; and their proficiency is shown by the fact that the team despatched to England more than held its own both in New Zealand and Australia.

Similarly, there is probably no point on which the Englishman prides himself more than his knowledge of politics and the freedom of his institutions. The Maoris have taken in as kindly a fashion to representative government as they have to football. They are born debaters, accustomed to have big meetings on matters of importance, at which questions at issue are discussed for hours, days, and sometimes weeks. Their orators deal in irony, sarcasm, poetry, allegory, metaphors, proverbs. Even the late Archbishop Whately himself could hardly have told them of a rhetorical device with which they are not acquainted.

There are four Maori representatives in the Lower House of the New Zealand Parliament, and two in the Legislative Council, and the speeches of all of them are as a rule effective and to the point. The Maori members are dressed in the European fashion, and, except for their olive skin, are hardly to be distinguished at first sight from their European brethren. All of them understand English sufficiently to follow the general drift of the proceedings. One of them, a half-caste, speaks our language perfectly, with a correctness of pronunciation, a choice of words and elocutionary effect which have caused him to be ranked among the best speakers in the House. The others, however, usually prefer to speak in their own tongue, and their remarks are interpreted sentence by sentence by the official interpreter standing by their side.

The Maori, as has been said, is a born orator, and the scene is a striking one. There is nothing persuasive about his eloquence as a rule; but it is often fiery, energetic, and forcible. He adorns his speeches with flights of imagery and figurative allusions, and is by no means deficient in a homely kind of humour. Looking at one of these Maori members addressing the House on the

grievances of his race, his eyes flashing fire, his hand outstretched with appropriate gesture, and speaking with an energy which causes the perspiration to stream down his face, you cannot help feeling that at any rate he is in earnest, 'that out of the fulness of the heart the mouth speaketh'; and that whatever may be said of some of his European colleagues, there is nothing assumed about his indignation. The only approach to an anti-climax is when the orator, exhausted by his forensic efforts, pulls out a huge party-coloured silk handkerchief and proceeds to 'mop' his face, hands, and even the back of his neck with an unsophisticated vigour that recalls 'the child of nature' once more to the mind of the audience.

It was in 1867 that the experiment was first tried of admitting Maoris to the New Zealand legislature. Various means of conciliating them had been adopted with indifferent success, and it was then resolved to try the effect of enabling them to ventilate their grievances in parliament by means of their own representatives. The Maori Representation Act, which was introduced by Mr M'Lean—afterwards Sir Donald M'Lean—for this purpose, provided that the colony should be divided into four Maori electoral districts, each returning one native member to the House. As it was merely tentative in the first instance, its operation was limited to five years. Mr M'Lean, in moving the second reading of the Bill, pointed out that the natives were possessed of considerable intelligence, for, said he, 'politics and war had been the history of their lives from their youth upward. Let them have the wholesome excitement resulting from freedom of election to replace the excitement of war. He thought the House would have reason hereafter to feel satisfied that it had preserved from oblivion the elements of mind of a most interesting race of people.'

The Bill was agreed to practically without opposition; and in 1872 Mr M'Lean asked for and obtained its extension for another five years. In his speech on the second reading he was able to tell the House that its operation had been very beneficial, and that amongst other things it had stimulated the desire for education among the Maoris. In 1876 so satisfied was the House as to the result of the experiments, that the Act, with a slight amendment, was re-enacted, to continue in operation until specially repealed by an Act of the General Assembly.

I have said that the Maori members are by no means devoid of humour. There is also a good deal of common-sense in many of their speeches. Let me give one or two instances which may illustrate both these points. In the No-confidence debate of 1876, Mr Taiaroa very dryly and pithily remarked: 'I now for the first time am aware that this Parliament House is the place where most of the talk is carried on. It is a very good thing that the meetings of the Parliament are held in Wellington, because it is a very windy place, and we hear the wind blowing about here every day. I liken the wind to the speeches that are made by honourable members of this House. The wind blows from all quarters, and so with the votes of honourable gentlemen. They are given this way to-day, another way to-morrow, and another way the next.' Needless to say this neat little satire on parliamentary government

was received with a torrent of laughter and applause. Mr Taiaroa still holds an honoured place in the New Zealand Parliament. He is now a member of the Legislative Council; and it may be interesting to add that one of his sons is one of the Maori team of footballers to which reference has been made.

As may be gathered from Mr Taiaroa's remarks just quoted, the Maoris have rather a contempt for No-confidence debates and constant struggles for office. In the No-confidence discussion of 1879, when Sir George Grey's ministry was turned out, Mr Tawhai, a portly, good-natured Maori, a shining light on Wesleyan and Blue Ribbon platforms, made the following remarks: 'It appears to be the usual thing, and a thing that is looked forward to by many members of the House, that one side should fight against the other. I don't see any good in that whatever. A great deal of harm is done in this kind of warfare, and this harm extends to people outside of this House. Instead of members devoting their time to measures which will benefit the country, they waste the time of the House in useless contention. It may be profitable to those who indulge in this sort of thing; but I can assure the House that it is not so to the people.' Could anything be more forcible or dignified than this remark coming from such a quarter? Most people will admit, probably, that even 'the untutored savage' may be able to find flaws in the institutions on which we pride ourselves as being perfect.

The motion of want of confidence in the Grey government was carried by forty-three votes to forty-one. It was a matter of general comment that the Maori votes always went with Sir George Grey, whose influence with the native race is proverbial; but on this occasion one of the quartet, Mr Tomoana, broke away from the leash, and this converted what would have been a tie into a victory for the opposition. Tomoana's vote, in fact, was quite the sensation of the crisis. He explained that the government had done nothing to redress the Maori grievances, therefore he should no longer support them. He then described an interview he had with the leader of the opposition, Mr Hall, in which the latter, he said, agreed to his views concerning the native race, and agreed to appoint a Maori minister to manage native affairs. 'I agreed,' added the speaker, 'to support his side. I shall exercise my vote as a chief. If I see anything wrong on the other side, I shall attempt to overthrow them. Whichever side is right, I shall attempt to uphold it.' This speech caused considerable excitement; and Mr Hall had to explain that he did not promise that a Maori minister should be appointed to manage native affairs, but merely that the cabinet should include a Maori member. Tomoana adhered to his promise of voting with the opposition, and on the formation of the Hall government was made a member of the Executive Council without portfolio.

He had, however, still another surprise in store for the House. About a fortnight afterwards he rose in his place on the Treasury benches and said: 'I have asked the ministers to send for some other native to sit in my place, because for many years my people have been suffering. Some are in jail' (alluding to the imprisonment

of the followers of a native fanatic who had been creating a disturbance), 'and the women and children have suffered, and nothing has been done in answer to their prayers to alleviate their sufferings. I said I should vote and deal honestly with Mr Hall, and so I wish to go honourably from this seat, because I cannot see what benefits my people are to derive from what fell from the native minister.' At the conclusion of this speech the honourable member left the government benches and walked majestically across the House, where he took his seat among the opposition amid the deafening cheers of that party. The ministry, it may be added, were strengthened from another quarter, and therefore continued in office in spite of the defection of their colleague. Since that time, however, a native has never been appointed to a seat in the executive.

This sketch would be incomplete were I not to say that the general conduct of the native members has been exemplary, and in some respects a pattern to their European colleagues. No unseemly interruption of a speaker is ever heard coming from a Maori member; nor has it ever been suggested, to my knowledge, that a good dinner at Bellamy's was unfavourable to oratory in the case of a Maori legislator, whatever scandals in that respect may be circulated about his white-skinned *confères*. To this it may be added, that no Maori has ever been known to vote against payment of the full honorarium to members; but then he has never been guilty of the hypocrisy of pretending to be in favour of a reduction while fervently hoping it will not be carried, and voting for the motion for retrenchment after making quite sure that there is no chance of its being adopted.

NABOTH'S VINEYARD.

CHAPTER III.

MR HEATH, examining his correspondence a morning or two later, was abruptly aroused from that fascinating study by the arrival of Colonel Sandhurst. The gallant officer appeared to be greatly disturbed, even so far as to have forgotten his gloves, a sign with him of some intense mental eruption. The solicitor, who had already ventured a pretty shrewd guess as to the primary cause of this perturbation, suavely asked for an explanation.

'Now, what do you think of this?' the injured one replied. 'That girl—Ethel, you know—is going to prevent my purchasing Fernleigh.'

'Very pleased to hear it,' Heath answered unfeelingly; 'only, I should like to know how she is going to manage it?'

'Why, this way. You see she happens to be the plaintiff in this lawsuit you were talking about, and has got the idea into her head that the assignment you people set up is really in existence. She is actually going to abandon her claim to all this money, and allow Mrs Charlesworth to take possession. There is no need to ask if your client will accept such an offer.'

Mr Heath at this moment would have cheerfully forfeited a good round sum to say that Mrs Charlesworth would accept it; but he did not, for the simple reason that he knew full well that nothing but the production of the assignment

would induce her to accept the offer of her generous enemy.

'I don't think she will, though, even for the sake of Fernleigh. All the same, this is very noble on Miss Morton's part. If the offer is rejected, it will be no fault of mine. But so convinced am I that it will be refused, that I have already commenced drawing the conveyance.'

'You really think so?' asked the Colonel, with a jubilation he was at some pains to conceal. 'You seem to have a quixotic lot of clients.'

'Perhaps so; but you will see I am right all the same. Even if Mrs Charlesworth is inclined to listen, her daughter Gladys will not.'

The Colonel's face darkened at the mention of this young lady's name. He had heard the romance on the previous night, with a feeling that Frank's interest in the girl was likely to end in a way contrary to all his fondest hopes. 'That is the hospital nurse, I presume? I hope Frank isn't going to make a fool of himself in that quarter.'

'Frank might do a great deal worse,' the lawyer answered curtly. 'And I will thank you to speak with a little more respect of Miss Charlesworth, who is *not* an hospital nurse, as you know as well as I do.'

'I beg your pardon, Heath,' returned Sandhurst humbly; 'but everything seems to have gone wrong lately. First, there was my scheme about Ethel and Frank; well, that's all knocked on the head. Imagine my surprise this morning to find Cresswell—you know him—in my sitting-room, talking to my ward as if the place belonged to him! It appears he came down last night; and, on my word as an officer and a gentleman, they had met and settled the whole thing before breakfast.'

Mr Heath gave a glance at the Colonel's doleful face and laughed aloud. It struck him as exquisitely absurd that an individual so singularly blessed both in body and estate should rail at fortune with the petulance of a child crying for the moon.

'Nonsense, man. You can't have everything your own way; and, besides, the young people are not like a lot of soldiers, to be ordered about on parade. Anyway, you can set your mind at rest anent Fernleigh. I have a note from the lady this morning, saying she will be pleased to see you any afternoon. As I am going there after lunch, you had better call about three. I have some business in the neighbourhood, and will meet you there at that time.'

'I suppose it must be done,' Sandhurst replied reluctantly. 'I don't half like the idea, all the same.'

'Of course you don't. What man would, who has in him a spark of kindness or gentlemanly feeling? All the same, it seems only right and proper towards the lady that you should go.'

'Very well. I will time myself to arrive there about three, and I only hope you will not keep me waiting. I am beginning to understand the feelings of a man in possession.'

'Better feel them than the emotion of those driven out of possession,' the lawyer returned grimly. 'I don't profess to have any sympathy with you in the matter.—And now, as my time is limited, I must turn you out. Three o'clock sharp, remember.'

With military punctuality, Colonel Sandhurst walked through Fernleigh gates as the stable clock struck the hour. Hot and dusty as it was outside, the sudden change to the cool green lawn with its shady ash trees and dark-leaved copper beeches was grateful and refreshing. The house, partly in shadow, with climbing rose and starry jessamine growing round the open windows and up to the carved oaken gables, presented a pleasing picture to eyes wearied with the contemplation of glaring roads and sunny meadows. Over all there seemed to hang the spirit of silence, broken only by an occasional bird-note, and the low moan of doves resting in the branches of a yew-tree, sombre against a belt of living green.

Inside, there appeared to be the same graceful harmony, the same sweet sense of refinement, a humanising influence borrowed from the presence of womanly love and delicacy—a fragrance of flowers in dragon vases and china brackets, with long spiral sprays of foliage hanging far down the dark polished walls. An open piano filled a corner; in an alcove gay with summer flowers stood an organ piled up with music. And into this pleasing picture there came presently a more beautiful vision still, a slight fair figure in deep mourning, relieved by white lace ruffles at the wrists and throat; the sight of which caused the Colonel to rise from his seat and render homage at the shrine of beauty.

'You are Colonel Sandhurst, I presume?' she said in a clear sweet voice, looking at the same time into his face with her beautiful violet eyes. 'I am Gladys Charlesworth.'

The Colonel bowed again, and murmured some platitudes in which the words 'honour and pleasure' were alone audible. Old soldier and man of the world as he was, he felt a strange sense of awkwardness and confusion in the presence of this simple English girl.

'My mother will see you in a few moments,' she continued; 'meanwhile, I trust you will find no inconvenience in waiting alone. You will excuse me when I mention that I am compelled to hurry away in consequence of the illness of one of our poor village people.'

'You find there is much suffering amongst the poor?' the Colonel asked, conscious of the inane of such a question.

'There would be less if the rich took a greater interest in those around them. If the Bartons-ham estate belonged to me, the labourers' cottages would not be in the disgraceful condition they are at present.—But I am afraid to say all I should like on that question. I hope you will not find any inconvenience in being kept waiting, Colonel Sandhurst.'

'Well,' muttered the discomfited soldier, conscious of the becoming blush adorning his bronzed cheek, and almost pleased to find himself alone, 'I haven't had such a snub since I was a subaltern. I wonder if my cottages are in such a state as she says? She did it in such a cool lady-like way, too. Egad, I don't wonder at Frank feeling somewhat'—

But at this moment the whole current of these reflections was changed by the entrance of another pleasing object, and the Colonel immediately experienced that mingled feeling of awe and pity all kind-hearted people do in the presence of the blind. The boy advanced slowly into the room,

touching a familiar object here and there with his long delicate fingers. To the interested spectator, but for that mute piteous groping of the hands, the blue eyes seemed to be filled with the divine gift of sight, though they were cast upwards, seeking for the light that never comes. To this bronzed service-worn soldier the sight of the child clad in his Van Dyck velvet suit and broad collar was more moving than all the panoply of war, as he watched him in a dazed fascination moving slowly to the alcove where the organ stood. Then he began to play.

Forgetful of everything but the deep interest aroused by this unaccustomed scene, the Colonel changed his place so as to obtain a closer view of the musician. As he did so, the movement entailed a slight noise; whereupon the music ceased, and the performer looked in the direction of the sound. 'Will you please come a little nearer?' said he. 'I did not know there was any one here. And tell me who you are.'

'My name is Colonel Sandhurst,' the interloper responded gravely.

'You are a soldier?'

'Well, yes; or I used to be, at least.'

Vivian felt his way in the direction of the voice, and stood with his hand resting on the Colonel's knee quite fearlessly. The fine old soldier and the pretty graceful lad made a charming picture as they posed thus.

'I never met a soldier before, though my brother Maurice was one. I don't think my mother will care to see you here, because it will remind her of Maurice. If I were you, I wouldn't say I was a soldier.'

'I am afraid Mrs Charlesworth knows that already,' the Colonel replied with much humility; 'and I don't suppose we shall talk much about myself, you see.—Won't you play something more?'

'No, not now. I want you to tell me something about battles. Were you ever in a real fight, Colonel Sandhurst?'

'Many, my child. I was all through the Crimea, and after that in the Indian Mutiny. Since then, I have always been at home.'

'I don't see how that can be,' replied Vivian, shaking his head. 'I don't mean about the battles, but about home, because Gladys says you haven't one.'

'And where did Gladys derive that priceless information?'

'If you have a home of your own, then why do you want ours? That's what Gladys says, and she is always right.'

'But some people like to have more than one home.'

'Then it can't be home,' said Vivian conclusively. 'I have never lived anywhere but here, and some day it will be my own. If I was not blind, I should like to go away and see the world; but that is not possible. I can see this house, and know where all the trees and flowers grow, and where to find the first violets. I'm not helpless, you know; I can do everything for myself, and find my way everywhere. But if we were to leave Fernleigh it would be very bad for me.'

The Colonel made no reply save a faint smile; he could not have answered the simple pathos of the last words for the supreme command of the British army and a field-marshal's bâton to boot.

For the first time in his roving life he began to understand the full significance of the word 'home' and the deep meaning it held for some. Of his beautiful house in Sussex he was justly proud; but this platonic affection for bricks and mortar, the idealisation of stone walls, he had no conception. Sitting there, with that child-grasp upon his knee, a new feeling, the consciousness of a new and better world, was budding in his soul.

'Don't you find it cruelly hard at times?' he asked abruptly.

'Well, I never notice it,' said the lad with the same touching simplicity; 'only the winter is rather long and dreary. But then, there is the wind: I like to listen to that. No one can see that; and when it blows, I know as much about it as other people. It is very nice for a blind boy to know where to find everything he wants. If you will come with me now, I can show you some dog-roses; the very first of the season, and I found them myself, too.'

Still the Colonel did not answer. He caught a glimpse of himself in a mirror opposite, and actually blushed at his own reflection. He had had, so he was telling himself, some pretty keen thrusts in his time, but never anything half so terrible as this innocent childish prattle. Every word seemed to find some joint in his armour of self-esteem, and to pierce selfishness like a knife.

'You would not care to leave Fernleigh altogether?' he asked.

'It would be very terrible,' said the lad solemnly. 'Not so bad, perhaps, if I was like other boys. But mother would feel it most.'

'You think she would find it very trying?'

'I think it would break her heart. She has not had a very happy life—at least, so Gladys says. Only, I know how she loves Fernleigh.'

There was something more than pity in the Colonel's eyes as he looked down at the pale flushed face at his knee. Mrs Charlesworth, entering the room at this moment, paused to contemplate this picture as she overheard her child's words, with a mute hope that some simple sentence might have gone home to the heart of her enemy.

'I hope Vivian has not been troubling you?' she said with a fond smile. 'I must apologise, Colonel Sandhurst'—

The Colonel stood up with a very red face, though the lady's features had suddenly become white and agitated. For a few moments they regarded each other in astonished silence.

'Margaret,' said Sandhurst, 'if—if I had known it was you'—

'You would not have sought this painful interview,' Mrs Charlesworth concluded with chilling dignity. 'It is bad enough without this.'

Vivian, perceiving he was not wanted, had stolen away through the open windows. His mother followed him with her eyes till he was out of earshot.

'You will understand,' she continued, 'that in Colonel Sandhurst I had not expected to meet my old friend, Captain Markham.'

'Nor I in Mrs Charlesworth my old *love*, Margaret Hay. Probably, if my uncle, Curtis Sandhurst, had died three years sooner, the penniless Captain Markham would have proved a more formidable rival to his successor.'

'You blame me, you dare to blame me, when

you— But all that is long since forgotten. Let me be as just and generous as I can. I have to thank you for your kind offer; but I cannot accept it. Legally speaking, Fernleigh is yours; therefore, I cannot accept from you a sum of money which I can only regard as a present.'

'You give me very little credit, it seems,' said the Colonel bitterly. 'I am only making up to you the value of the property. You refuse to take what you call a present from me. I absolutely refuse to rob you of what I know is your just due. I distinctly decline to avail myself of so iniquitous a law as this foreclosure.'

'It is hard for me to appreciate this sentiment,' Mrs Charlesworth replied as bitterly, 'when I am losing what is to me a part of my very being. I cannot blame you, for I know that in all probability Fernleigh must go. Mr Heath tells me'—

'Let him answer for himself in person,' cried the lawyer, coming forward.—'Ah, I see you are still discussing Fernleigh. I presume, you have thanked Colonel Sandhurst for his magnificent offer?'

'I have thanked him, and declined it.—Of course, it is impossible for a stranger to comprehend the affection we have for the old place. Call it sentiment, if you like; but the idea of selling Fernleigh'—

'Madam, on my honour as a soldier and a gentleman,' the Colonel cried impulsively, 'if I can do anything in my power to retain your home to you, I will. Let things remain as they are for the present, and we shall see what time will do.'

Mrs Charlesworth bowed deeply. She was surprised and not a little touched at this outspoken generosity.

Mr Heath, the only one unmoved, looked from one to the other with a deep gleam of triumph in his eyes. 'You have done well, Colonel,' he said dryly, 'so well, that you will be pleased to hear my news. I have a great surprise in store for you.'

'I know!' cried Mrs Charlesworth with a glowing face. 'You have found the assignment?'

'I have heard worse guesses,' replied the lawyer with the same dry manner, taking a parchment from his pocket and handling it tenderly. 'That is precisely what I have done.'

EXTREMES OF HUMANITY.

It has always been a matter for discussion whether there ever existed, or still exist, any nations who may absolutely come under the terms of Giants and Dwarfs. In many ancient writings are mentioned various races of Pygmies as inhabiting the cold northern climes of Scythia, or the tropical desert of Libya and Asia Minor. Herodotus also speaks of a race of little men of ink-black complexion who inhabited a large city on a river which flowed from west to east of Libya, and swarmed with horrible crocodiles. Otesias, another Greek traveller, a contemporary of Xenophon, states that he saw in Central India

a race of Pygmies only two feet in stature; they inhabited a province in which the animals were proportionately small, the sheep being no larger than new-born lambs, and the horses, cattle, asses, and mules no larger than a ram. Aristotle mentions likewise a nation of dwarfs, and places them in Central Africa; whereas Pliny gives Thrace as their original cradle. Ptolemy in his History talks of a 'little people' called the Pechinians, whom he describes as inhabiting a large portion of the eastern frontiers of Ethiopia. In later times, an English sailor, Andrew Battel, who was taken prisoner by the Portuguese in 1588, and carried into Congo, relates in his book called *Strange Adventures* that he met with a nation of dwarfs called the 'Matimbos.' A Dutch traveller, Oliver Dapper, also describes a little nation of elephant-hunters, called the Mimos or Bakke-Bakkes, whom he found in 1686 inhabiting a district near the Congo River, called the kingdom of Macoco.

One of the latest travellers who make mention of a dwarf nation is M. du Chaillu, who in 1860 speaks of a strange people, of wild and timid habits, whom he found inhabiting a large tract of land in the country of Ashango; they were styled Ovongos by their neighbours the Ashoungas, but they neither intermarried with nor cultivated the ground of the nation amongst whom they lived. The Ovongos were negroes of hideous aspect and yellow complexion, and measured about four feet five inches in height.

As regards giants, primitive traditions are as full of accounts of men of enormous stature as they are of dwarfs. The poets and historians of antiquity aver that the human race did not begin to deteriorate till the time of Homer; sculptures exist, and are now preserved in the British Museum, of the frieze of the temple of Athena Polias at Priene—one of the twelve Ionian cities of Asia Minor—representing a combat between men and giants; and similar ones are to be seen in the temples of Selinonte, Argos, Agrigente, Athens, and Pergamus. Pliny says that on the occasion of a terrible earthquake in Italy, a fissure opened, revealing the skeleton of a man embedded upright in the earth, measuring about twenty-six feet in height! Plutarch goes further; he declares that a skeleton was found by Sertorius at Tangier, in Mauritania, measuring about forty feet; and Phlegon of Lydia, in his Treatise on Wonders, says that there were discovered in the Cimmerian Bosphorus and in Africa a vast number of skeletons averaging between twelve and fifteen feet in stature.

The traveller Magellan recounts in his *Travels*, written in 1520, that in latitude thirty-four degrees, near the mouth of the Plata River, he met with a gigantic tribe of Patagonians. He says that he measured many of them, and that they exceeded seven and often nine feet in height. But whether it is that the race is degenerating, or that Magellan exaggerated his measurements, it is certain that they do not at the present day exceed seven feet, and their normal height is about six and a half feet; the women being quite as tall, and as powerfully proportioned as the men.

At all times and in all countries, kings and nobles had a fancy for including amongst their retainers either a giant or a dwarf, sometimes both. Frederick the Great had his corps of gigantic grenadiers; and in the Tower of London may be seen a lance and some enormous armour of sixteenth-century work, which doubtless belonged to some giant knight or trooper of the king's bodyguard. James I. had attached to his person a porter named Walter Parsons, commonly called the Staffordshire giant, a handsome, brave, and strong young man, who had begun life as a farrier. His height was seven feet seven inches, and his portrait exists, engraved by Glover. Parsons lived on into the reign of Charles I., and was succeeded in his office by another giant, William Evans, who was two inches taller than his predecessor.

Cromwell also had a valet named Daniel, who was seven feet six inches in height, but of weak intellect. He unfortunately ended his days in Bedlam, having become possessed with the idea that he had been sent on the earth to prophesy coming events. Contemporary with Daniel lived Anthony Payne, a handsome and clever young farmer in Cornwall, a tenant of Sir Beville Granville at Stowe. He was as remarkable for his wit as for his strength and stature, which exceeded seven feet. This county has always been as famous for its big men as is Yorkshire; and to this day the proverb exists, 'As long as Tony Payne's foot.' After a career of many vicissitudes and long military service in the Stuart cause, Anthony Payne died at a good old age, and was buried in a vault in Stratton Church.

In 1686, and in the earlier part of the same century, two gigantic negroes were shown about London. They were said to be the sons of kings of two African tribes, and were captured by slavers, who brought them to this country. The first was Giolo, son of the king of the Moangi tribe. The other was known as 'the Black Prince,' and became converted to Christianity, and was admitted as a member of the household of the family of Clifton, living at Clifton, near Nottingham. He was christened Joseph; and a mark may still, we believe, be seen in Clifton Churchyard which gives his height as seven feet. Giants are usually not gifted with any more beauty than their opposites in creation, and are generally more remarkable for their awkwardness and stupid stolid looks than for any natural grace or intellectual brilliancy. There was, however, an exception to this general rule in the person of Maximilian Christopher Müller, a German giant, who travelled about in France and England in the reigns of Louis XIV. and George II. He was a man of splendid build and noble proportions, with a handsome and striking countenance, and measured exactly seven feet eight inches in height. His hand was twelve inches long from the wrist to the tip of the middle finger. He died in London in 1734, aged sixty, not long after Hogarth had introduced his portrait into his famous picture of 'Southwark Fair.'

It is a curious fact that the population of France has rarely produced a giant; Great Britain, Germany, Poland, and Switzerland carry off the palm; and this may perhaps be attributable to the prevalence in France of a vegetarian

diet, which does not tend to develop to so great an extent the growth of muscle as does the stronger diet of meat.

The eighteenth century, to judge by contemporary letters and newspapers, seems to have been more than usually prolific in giants and giantesses. Horace Walpole mentions a giant and giantess who were on view respectively at Spring Gardens, and at Half-moon Court, Ludgate Hill. They were both, it seems, handsome and well-proportioned persons, and without the usual awkward ungainliness of their kind. At this time, also, appeared a young Italian giantess seven feet in height, 'who was the admiration'—said the handbills—'of the Emperor of Germany, of eight kings of Europe, and of the Grand Czar of Moscow himself.' Her appearance seems to have been followed, in 1742, by that of Cæjanus, the famous Swedish giant, commonly called the 'living Colossus,' who came over to England and established himself at a house opposite the Mansion House. He was the son of a pastor of a little village in Finland, and stood eight feet four inches in his socks. In 1755 London was visited by another Italian giant, named Bernardo Gigli or Gilli, who measured eight feet in height, and seems to have created an immense sensation by the colossal proportions of his limbs.

But no giant ever created such a furore as did Charles Byrne, the Irish giant, who was eight feet eight inches in height, and possessed of enormous strength. He was clever and shrewd, and full of the natural wit of his mother-country; but unfortunately the large fortune he rapidly gained by the exhibition of himself led him into habits of gluttony and intemperance, and he died at the early age of two-and-twenty, leaving instructions that his body was to be buried at sea; but the College of Surgeons in some way obtained his corpse for the sum of eight hundred pounds, according to certain reports; and the skeleton was 'set up' in their Museum by William Hunter, the famous anatomist.

Shortly after Byrne's death, another Irish giant exhibited himself in London, by name Patrick Cotter, alias O'Brien. He was so attenuated that, tall as he was, he appeared even taller. His height was eight feet seven inches. Feeble and debilitated in health, he could only walk by supporting himself on the shoulders of two tall men walking in front of him, resting a hand on a shoulder of each. Many amusing stories are related of him. One evening, at a masonic dinner, he took out of his pocket the celebrated dwarf Count Borulaski, and set him upon the table, to the astonishment of all the guests. Some time after, whilst staying at Bath, he nearly terrified a night-watchman out of his wits by taking off the top of a street-lamp and lighting his pipe at the flame. He was of an amiable and gentle disposition, but not remarkable for any intellectual capacity. Since his day to the present time, London has only seen four giants of any abnormal height or size—namely, James Tolles, eight feet six inches in height in 1819; Scott; Chang; and Herr Winckelmeier, the Bavarian giant.

Of giantesses, Miss Scott and Pauline Marie Elizabeth Wedde are the only colossal ladies who have astonished the eyes of the sight-seeing world. The latter, called the Queen of the Amazons, was

born at Ben-Rendorf, in Thuringia, on the 31st of January 1866, and introduced to the London public at the Alhambra in a piece entitled *Babil and Bijou*. She was good-looking, and of a handsome, well-proportioned figure, and measured about eight feet four inches in height. Of her subsequent history and career we have not been able to trace any account, since her provincial tour in France, after exhibiting herself in this country.

It is a curious fact that giants rarely exceed the age of forty or forty-five, and few amongst them ever show signs of much intellectual capacity. They are as a rule good-tempered, indolent, and placid; their opposite extremes, the dwarfs, being irritable, active, clever, and ill-tempered.

Dwarfs may be divided into two sections, firstly, those who are born so, and remain dwarfs all their lives from childhood till maturity; and secondly, those who become dwarfs from some accident in the early months or years of childhood. It may be remarked that those dwarfs who come under the first head are often noticeable for their shrewdness and intellectual capacity, combined with much childish vanity and an overweening love of dress and admiration. Those, on the other hand, who are deformed and show an unnatural development of any special limb, are as a rule irritable, semi-idiotic, and incapable of any high degree of mental capacity.

One of the most celebrated dwarfs of whom we read in history was Nicholas Ferry, the dwarf of King Stanislas of Poland, who was remarkable for his wit, good temper, and intellectual attainments and accomplishments. Next after him in celebrity ranks a female dwarf named Babet Schreier, who was born at Piegelsbach, near Mannheim, on the 31st of October 1810. Her parents were poor labourers, hale and hearty people, who permitted visitors to see their wonderful child, but would never consent, poor as they were, to exhibit her for any pecuniary benefit. Babet was perfectly formed, although when she was born she weighed only a pound and a half. She grew till she was about two feet and a half high, and there stopped. Her health was always good, and her character amiable and lively.

It is a strange fact that the length of life of dwarfs seems to be in proportion to their size and stamina; they arrive at maturity quicker than a normal human being, and age quicker. We read of this in the case of the famous English dwarf Hopkins, who lived about 1751. At fifteen years old he measured two feet seven inches in height, and weighed only thirty pounds. Up to this age he had the appearance of a fresh smooth-skinned youth; but suddenly an extraordinary semblance of the most decrepit old age began to creep upon him. He became bent, crooked, and torn with an asthmatic cough; sight and hearing began to fail, and his teeth to drop out or decay. So attenuated and feeble did he become, that he could not walk without a stick, and presented all the appearance of a withered and aged man. Before these signs of decay came upon him his weight had been nineteen pounds; but now he lost nearly six pounds, and visibly shrank, till he died in about a year from sheer decrepitude and old age. His parents were fine tall healthy people, and there had been no previous member of his family who showed a similar abnormal condition. He

died on the 19th of March 1754, aged seventeen years and two months.

Although dwarfs generally attain a greater age than giants, still they rarely pass threescore and ten. There are, however, two notable exceptions to this rule, in the persons of Amias Clowes, the famous Matlock dwarf, who died at that place in 1784, at the ripe age of one hundred and three, his height being three feet and a half. He had caused to be built for himself a little house eight feet square, furnished with articles suitable to his size. The other instance was that of Peter the Great's favourite and dwarf, a woman he called Poupée, whose height was that of a child of six. She was remarkably pretty, lively, and clever, and the emperor had an extraordinary affection for her. She lived to pass the age of one hundred years without ever having suffered from any illness or infirmity.

There may still be seen in the Ducal Palace at Mantua six little rooms opening one out of the other, which were constructed by order of one of the Dukes of Mantua for the special occupation of his favourite dwarfs. The walls of these apartments are but six feet high, and the floors eight feet square, and they are reached by two staircases of small steps. These rooms are at present denuded of all furniture, and the doors even have been taken off their hinges.

In our own times, no dwarf has created more sensation than Charles S. Stratton, commonly known as 'General Tom Thumb.' His career of self-exhibition was one long success both to himself and to Barnum, who undertook to show him about. His tour in Europe alone brought him fifty thousand pounds. He married Lavinia Warren, one of two dwarf sisters who accompanied him on his tours. Of this marriage was born one child, a girl, who died in 1866, when about three years old. Tom Thumb himself died in 1883; and his widow, we believe, married again another American dwarf. General and Mrs White succeeded to the celebrity and admiration formerly bestowed on General Tom Thumb, and charmed the public by their amusing ways and imitations of popular actors and singers.

NOT QUITE LOST.

A TRUE TALE OF THE SEA.

IN the spring of 18— I was at one of the islands on the west coast of Africa, anxious to take the first chance that offered of getting back to Old England. One of the huge Cape mail-boats was due in about a week from the time my story commences—boats which combine the comforts of a first-class hotel with the nearest approach to absolute safety that persons trusting themselves to the mercy of the sea can reasonably expect. I did not, however, intend to wait for the mail-boat, if any other vessel offered a chance of getting to England before her. One morning a steamer came in bound for England. She was a cargo-boat, but carrying a few passengers; and the captain said he could make room for me. Before taking a passage in this vessel I had a good look at her, and I came to the conclusion that, though there were not many comforts on board, at any rate she looked like a good safe sea-boat. She had plenty of freeboard: indeed, I found out

afterwards that her cargo was a light one, consisting of wool and raw hides, so that she was higher out of water than usual, and she had good beam for her length.

I went on board about six P.M. on a Friday evening. The weather was beautiful. The deep blue sky—set off by the still deeper blue of the sea, only broken here and there by the smallest of 'white horses'—and the island glowing in all the beauty of tropical sunshine, made a picture not easy to forget. The passengers consisted of eighteen first-class and ten steerage. Amongst the former were two ladies and four little children. The crew mustered about twenty men all told. After dinner, I went on deck to smoke the pipe of peace and think of wife and children, who were being brought nearer to me by every throb of the powerful engines.

All the cabins were on the upper deck, the hold being devoted to cargo, with the exception of one small cabin for the steward. The vessel was steered from the bridge; but there was another wheelhouse right aft, for use in case of emergency. She carried two masts, and was square-rigged on her foremast.

Next day, when I turned out, we were out of sight of land; the weather was still fine, though there was a little sea, caused by the north-east trade-wind, which was blowing steadily, though not very strongly, against us. All went well till the evening. At six o'clock the cabin passengers dined, the captain, a jovial, ruddy-faced sailor, who looked as if he had no cares in the world, taking the head of the table; and the doctor, a self-possessed wiry little man, taking the other end. As dinner went on, the flow of small-talk increased, till, towards the end, there was a regular hum of conversation, and most of us were looking tolerably happy and contented. Suddenly, the whole scene changed: first came a crash, which seemed to shake the ship from end to end; and then scrape, thud, hammer, as the engines continued to make several revolutions before they were stopped. As we were at least two hundred miles from any land or shoal-water, I knew instinctively that the screw-shaft was broken, and that, in all probability, those last two or three revolutions had done terrible mischief.

We all made the best of our way on deck. The passengers were not much alarmed as yet; but I noticed a look of great anxiety on the captain's face as he hurried away.

It soon transpired that the shaft was broken; and the broken ends hammering against each other before the engines could be stopped had broken the after-bearing where the shaft passes out through the ship, and water was pouring in there into the tunnel (fifty or sixty feet in length) leading to the engine-room, along which the shaft passes. The well was sounded—about a foot of water was found, and preparations were at once made to get the pumps to work.

I must now recount a noble deed, which under other circumstances might well have earned a Victoria Cross. The tunnel which I have just mentioned ended at the engine-room with a water-tight door in a so-called water-tight bulk-head. The chief engineer, knowing at once what had happened, and finding a large body of water coming out of the tunnel, called for

volunteers to go with him up the tunnel and try to stop the leak. The danger was very great; the tunnel was already half full of water, the rush of which was so strong that it was difficult to walk against it; and at the rate it was rising, it seemed almost impossible for men to get to the end of the tunnel and back again before it was full of water, in which case they must have been drowned. One man only responded to the appeal of the chief; and these two brave fellows, regardless of everything but their duty, dashed into the tunnel, carrying blankets and ropes to secure over the leak. They actually got to the end of the tunnel and succeeded in placing the blankets over the hole; but before they could secure them, the rising water forced them back, just filling the tunnel as they were dashed back into the engine-room. Then, with great difficulty, the water-tight door was closed; and the fires not having been put out, though the water had nearly risen up to them, they were able to work a powerful steam-pump with which the vessel was fitted, soon reducing the water in the engine-room. The water-tight bulkhead was still leaking badly in several places, and it required all the skill of the chief engineer to make it sufficiently tight to prevent the water from gaining on the pumps inside the engine-room.

Abaft the engine-room the water was rapidly rising. Some of the passengers had been set to work at a hand-pump on deck; but being a poor pump, it was worked very hard with little result. We took the work in two gangs, twenty minutes off and on, and I found myself smoking my pipe between the spells with considerable comfort.

The well was sounded again, and five feet of water found in it. Shortly after this, the captain told me privately that there was no chance of saving the ship; and he was shortly going to give the order to prepare the boats for leaving her. This order was soon given; and then occurred the only sign of panic which I saw from first to last. Some of the crew, which was composed of men of several nationalities, made a dash at one of the boats, with the intention of getting away in her by themselves. The night was dark, the moon not having yet risen, so that they were not noticed for a minute or two; but when the mates found out what was going on, they bundled them out of the boat in no time.

About this time I had occasion to go through the saloon; the steward was there; and although he knew that orders had been given to leave the ship, he was busy dusting some glasses in a rack, and had evidently been round the saloon putting everything in perfect order, so that it might go to the bottom tidy! I suppose habit was second nature to him. On going out, I passed the cabin where the four children were peacefully sleeping. I could not help peeping in; but it was sad to look at the rosy cheeks and peaceful faces of the little ones, and to think what a small chance they had of surviving a long boat-cruise.

The vessel was well found in boats, six in all—four large ones, and two light gigs. It was decided to use only the four large boats, as they would take us all; and we set to work to get them swung out and provisioned in a hurry. It was an exciting time! If the vessel had been

sinking quickly, we should not have got one boat away. Nothing would work easily; the davits stuck for a long time, and resisted all our efforts to turn them; and the falls jammed in the blocks. Moreover, the boat I was told off to had been painted the day before, and was all over wet paint, which made it most difficult to handle her, besides leaving a reminder on one's garments. However, it was done at last; and tinned meat, biscuits, and water put into each boat. As to our water-cask, it was so rotten it could not hold water at all, and we had to content ourselves with filling a few bottles.

The captain then ordered the women and children and one sick man into the boat he was going to take charge of; and in they got, the boat still swinging at the davits. One old man brought all his heavy boxes from the cabin, and placed them beside the boat he was going in; and when told he could only take some wraps, he quietly dragged them back to his cabin.

Just as the order was going to be given for all to leave the ship, and even the man at the wheel had been called away, the chief-engineer came on deck and said to the captain: 'Don't you leave the ship, sir; I believe we can save her.' He then explained that though the engine-room bulkhead had leaked considerably, he and his men had made it nearly tight, and what little water came into the engine-room was easily pumped out again; and though the water was still rising abaft the engine-room, it was not rising so fast as it did at first; and the vessel, in his opinion, was sure to float for some hours yet, if she could not be kept afloat altogether.

The captain consented to wait till daylight, and we men went back to the pumps, though the poor women and children were still kept swinging at the davits, the captain being afraid to take them out of the boats, for fear there would not be time to get them in again. But after about two hours of it, he let them come out.

The dreary night wore on. Cocoa, and once a drink of rum, were served out to the men at the pumps. When the rum came—a wine-glassful to every two men—the man I shared with was a grimy stoker, and he had first drink; for a moment I hesitated when my turn came; but the claims of exhausted nature were not to be denied.

The moon was up now. We got some sail on the vessel, and headed her for Madeira, which was about two hundred miles distant, and the wind fair. As far as we could see, no vessels were in sight; but some rockets were tried. Only one of them, however, went up, the rest being damp and useless.

Sunday morning broke at last. A sad Sunday! We anxiously scanned the horizon: there was not a sail in sight anywhere.

The bulkhead which was keeping us up for the time-being was nearly amidsips, but not quite, it being a little aft of that position, so not quite half the vessel was at the mercy of the leak.

Shortly after daylight there was a consultation in the captain's cabin as to what should be done. It was decided to take the hatches off, and throw over all the cargo abaft the engine-room that could be got at. There was a steam-winch available, and a derrick was soon rigged up. The cargo we could get at was all wool, in bales of about ten hundredweight each; and as bale after

bale went over the side, we made a long wake of them, as they did not sink at once.

The weather still kept fairly fine; had it not been for this, we could not have taken off the hatches, as the after-part of the vessel was by this time rather low in the water, and we should in all probability have been unable to save the ship.

The steward had not neglected his duty, and had prepared as good a breakfast as he could manage; and mechanically we went to it, not that anybody had any real wish to go to breakfast, but as a matter of habit. It was an uncanny thing, also, to take a meal in a cabin which one felt almost sure would be at the bottom of the sea before the next meal-time came round. Yet, in we went, the captain taking the head of the table as usual; but he could eat nothing, and even his jovial ruddy face was much altered.

Shortly after breakfast, one of the sailors who was on the lookout cried 'Sail ho!' We certainly saw what appeared to be a sail; but it disappeared and again appeared in a curious manner. Everybody brightened up at this news, particularly the poor women; but after careful examination through the glass, it turned out to be only some whales spouting.

Ten feet of water being in the hold by the afternoon, the stern of the vessel was very much lower in the water. Towards evening, as the light was beginning to fade, we saw a steamer; but it was hull down, and we could only see its masts and funnel. We had an old carronade which had probably last been fired at the battle of the Nile. This was loaded, and with great difficulty fired; but it took such a long time, that the steamer was out of sight before it went off, and no result followed. We also tried one or two more rockets; but it was of no use.

Sunday night. All the cargo in the after-hold that could be got at had been thrown overboard; so, by way of using the steam-winch, a large cask was rigged up and lowered into the hold, filled with water, hoisted up, and tipped overboard. This could be done about twice a minute, and helped considerably to keep the water down. The stench from the hold added now to our discomforts, as the raw hides and wool began to ferment, owing to the action of the water combined with the heat of the weather. But that was a small matter.

And so the second night went on. The great ship looming against the star-lit sky with her dark square sails set on the foremast, her bows towering high above the sea, her stern nearly level with it, and three red lights on her foremast—signals of distress—looked like some huge monster out of a fairy tale stricken nigh unto death, but struggling on while life lasted.

There were some curious traits of character exhibited on the part of both crew and passengers, though most of them did their duty quietly and manfully. One man, a steerage passenger, took to his berth after the accident happened. When the second-mate went to rouse him up and make him take his turn at the pumps, he said 'he was not going to pump; he knew the vessel was going down, and he would die comfortable in his berth.' In fact he was left there, as the mate had no time to waste over him. Another man armed himself with a

revolver, with the intention of shooting himself if the worst came to the worst, as he said he preferred shooting to drowning. The revolver was taken from him.

At half-past three on Monday morning, just before the first glimmer of daylight appeared, we sighted another steamer. No rockets were left; but fortunately there was a Roman candle, and this was supplemented by a blue light. The vessel was about three miles away, and passing us at that distance. For about two minutes after the blue light had died out, we all strained our eyes in anxious silence; but the stranger was keeping a good lookout, and at the end of that time a bright light appeared from its deck for a moment; and then up into the clear sky shot a majestic rocket, and bursting at a great height, showered down its coloured balls. I have seen many rockets, but never enjoyed the sight of one so much as I did then. A deep sigh of relief passed through all the assembled watchers; and almost immediately after, we could see all three of the steamer's lights, showing she was steering straight for us. She soon got alongside as nearly as she dared to come; and her captain having arranged to tow us to Madeira, distant about one hundred and ninety miles, if we could keep our vessel afloat, we were taken in tow. To manage this we had to lower one of our boats; and the trouble we had in getting that boat safely afloat gave us some idea of the difficulty and danger there would have been, in the state of the sea, in getting everybody safely away in the boats.

We had two more nights and days of pumping and bailing, the water still gradually gaining on us. Once or twice we managed to lower it an inch or two; but we soon lost the advantage we had gained. So matters went on. The last night, before we got in, I noticed that every now and then little dark shadows flitted across the deck, which I was at a loss to account for. The mystery was explained the next morning, for one of the children happening to go into the after-wheelhouse, which was not used in a general way, found nearly all the rats in the ship assembled there. They had forsaken the hold, either because they considered the risk of drowning was too great there, or possibly with some desperate hope of being able to leave the ship before she went down. We made a raid on them, and eleven rats came to an untimely end; 'the rest they ran away.'

Having sighted and passed the inhospitable island of Porto Santo, we arrived off the east end of Madeira. By this time there was fourteen feet of water in the after-hold, and the stern of the vessel was still lower in the water. There is a considerable race off the east end of the island, caused, I suppose, by unequal soundings; and the way the poor ship rolled in this broken water was sickening. She would make a heavy roll, say, to port, and then she would stop, and as the weight of water followed the roll, she would continue to roll the same way as before, till you felt sure she was going to capsize; then she would slowly right, and go through the same performance the other way. However, we soon got under the lee of the island and into smooth water.

Our steamer had come from a South American

port which the Portuguese are pleased to consider unhealthy. Though there was nobody ill on board, and the vessel had left that port some three weeks or more, she was obliged to hoist the yellow quarantine flag on nearing Madeira. As we passed the signal staff, a lot of little flags went up. I was standing by the captain at the time, and heard him mutter something in which the word 'fools' was noticeable. I asked what the signal meant. The question asked was: 'Are you in distress?' A brief 'Yes' was the reply. Again up went the little flags from the station, and this time they said, 'Do not anchor if you can help it;' and that because we were flying the yellow flag. These inhospitable Portuguese, rather than run the most remote risk of disease, would have allowed us to go to the bottom without any help. Our captain answered: 'Must anchor, or beach her;' and shortly after, we did anchor. But not a soul was allowed on board to help us; and a guard was set over us, to prevent any of the passengers or crew from landing.

However, we got some help at last. The people of Madeira are noted for their powers of swimming and diving. No diving-dresses were to be had; but without them, we got two of the best divers to come off, and though not allowed to come on board, they were allowed to work outside the ship. They had two boats made fast astern, and they dived in turn, taking a header with a lump of oakum in one hand, and in the other a short thin piece of wood to drive in the oakum. They had a depth of twenty feet to dive to get to the leak, still each time they managed to drive in the lump of oakum before coming up; and after a time, they so far stopped the leak that the pumps began to gain on it. This was all that was wanted; and six hours after, the water was so far reduced that the engineers were able to get at the leak from the inside.

Two or three days longer we were kept prisoners on board a vessel that could not move; and then one of the huge Castle line of steamers came in, to which I joyfully transferred myself and luggage after a hearty good-bye to the captain and others.

Thus, by God's help, and the care and patient perseverance of the captain and his officers, not a life was lost or a person injured, and the good ship herself was kept afloat. Four days later I reached Plymouth.

DAY-DREAMS.

HERE at least is a haven of refuge where a man may wander at will without fear of interruption, and with no other critic than himself to deal gently with the flights of fancy in which he may indulge at pleasure. Indeed, there is no limit but his own imagination to check the magnitude of his thoughts and the execution of his vast designs. Does he wish to assume regal honour? In a moment he is clothed with imperial purple, and surrounded by the wisest men of the age, who gratefully pay tribute to his greatness and magnificence. Statesmen involuntarily consent to be guided by his intellect, and express no sense of wounded pride in that they are the learners, and he the dictator of wisdom. A court flled with learning and wit obeys his slightest behest;

while women of peerless beauty and virtue minister to his wants with a grace that Diana herself might envy, and which the less favoured of mankind sigh in vain to obtain. Untold wealth surrounds him with a lustre that only serves as a foil to the magnificent scene; while jewels of a king's ransom lend their beauty to deck the path of the all-good and great king, whose greatest happiness lies in the content of his people and the prosperity of his country.

Wearied of such splendid inaction, the sceptre of the throne is immediately changed for the baton of a general, who commands armies which carry all before them, and whose strongest passion is love for their commander. Campaigns more brilliant than those of Condé, Wellington, or Napoleon are commenced and concluded in a breath, and fresh laurels added to his brow, already adorned with innumerable trophies of war. Captives bow down before him in thousands; and the haughty oppressor bends the neck that has hitherto been held in proud disdain against the world, till subdued and conquered by superior strength and sagacity. Besieged towns hold out their arms at his approach; and the thunder of his cannon strikes terror into the heart of the tyrannical autocrat, while giving assurance of his protection to the weak and oppressed. In less time than the words are written, triumphal arches rise from the ground; and surrounded by his victorious troops, he passes through the midst of the grateful thousands who assemble to do him honour, and who, breathing blessings on every side, add their presence to a scene which causes the triumphs of the Roman generals to fade into insignificance by comparison.

Again the scene is changed, and he is the greatest philanthropist that the world has ever seen. Prison doors open at his approach, and the wretched inmates fall down in gratitude at the feet of their deliverer, who has inaugurated the reign of mercy and kindness in the place of harsh severity and labour. Out of the midst of poverty and wretchedness arises like magic a scene of cleanliness and beauty; and where hitherto have been but squalid misery and vice, in a moment is now a scene peopled with the happy spirits of content and virtue. Well-built and prettily designed cottages supply the place of the fever-stricken dens that in the immediate past were the homes of thousands who could afford no other. In the front of each is a garden, filled with old-fashioned flowers, that put to shame those of many a mansion; while all around, and in the close proximity of friendly relationship, fruit and vegetables fill up the picture of Arcadian beauty which surrounds those who are unconsciously educated and refined by that which their own industry and care serve to maintain. Sallow cheeks, stooping shoulders, and stunted growths are replaced by ruddy faces and stalwart frames; while scowls give place to smiles of self-respect, now one of the chief movers in the regenerating influence which, from being but individual, has at once become universal. Hospitals are endowed with a munificence that for ever frees them from fear of debt, and allows their noble work to be pursued in a manner which science cannot improve upon, and which humanity regards with an admiration akin to reverence. The inmates of the crowded cities

grow young once more in the enjoyment of fresh air and green fields; while the children regain the roses of health and happiness amongst the sweet-smelling hay and flowers which grow around them. Factories and workshops are compelled to provide for the comfort and health of those who work within their walls, and to close at a reasonable hour under heavy penal laws, which protect the interests of the weak while dealing fairly with the employer; and the disgraceful practice of shutting up young children in close rooms where the seeds of disease and early death were formerly sown broadcast, is now happily looked upon as a barbarity of a former age, which foolishly sacrificed the strength of future generations to a misplaced and selfish greed of gain to itself.

These are only a few of the delights which the creative genius of Fancy calls to life and action, and in a few moments places the dreamer in the centre of a panorama which is called into existence solely for his pleasure, and of which he is at once the artist and admirer. Lying carelessly back in the well-worn armchair in an attitude in which comfort defies appearances, the dreamer can summon at will pictures of the brightest and most variable hue, changing from grave to gay at his pleasure; in one moment filled with the quaintest humour; while in the next, by an easy and natural transition, surrounded by a pathos which brings tears into the eyes in unconscious acknowledgment of the truth of the picture. And for all this there is needed only the hour of twilight and quietness to call to life more joys than an emperor can purchase with gold, and more delights than are pictured in the fairy tales of youth and childhood.

NO PRAYER TO-NIGHT.

No prayer to-night! No golden head
To lie in my lap with glittering light;
But a broken heart, and a sigh instead—
Ah me! ah me! no prayer to-night.

No lisping tongue, no dimpled hands,
To sing and strike in keen delight;
No hair to plait in glistening strands—
Ah me! ah me! no prayer to-night.

No prayer to-night—no bright eyes shine;
No cradled head to catch my sight;
No rosy lips pressed close to mine—
Ah me! ah me! no prayer to-night.

No trusting love; no pearly tears;
No smile; no laughter loud and bright;
No little voice to tell its fears—
Ah me! ah me! no prayer to-night.

No prayer to-night: an aching heart,
A life that is full of care and blight,
A life that has sorrow in every part—
Ah me! ah me! no prayer to-night.

OUR WINDOWS.

WINDOWS are sometimes called, fancifully, the eyes of the house, just as human eyes are sometimes called the windows of the soul. There is not sufficient height of walling in any of the numerous remains of hut-circles to inform us whether the ancient Britons had eyes, or window-openings, to their dwellings; but as there is evidence that they were acquainted with the advantages of flues, or openings at the backs of their hearths for the escape of smoke, we must not decide they were without them. For our present purpose, however, it will be sufficient to look at the work of the old masons after the days of the Heptarchy. We have plenty of structural evidence that Saxon masons left small openings for light in the sturdy fabrics they reared. We have still many Saxon towers with small unglazed deeply recessed window-openings at various stages of their height, divided into two lights by strong rounded balusters. Most frequently, the heads of these openings are semicircular; but occasionally they are acutely pointed like two sides of a triangle. There is one of these Saxon church towers in the chief street in Lincoln, looking down on all the busy traffic of the place as it has looked down upon all its preceding phases for a thousand years. There is another in one of the main streets of Oxford, as silent and unperturbed. There is a well-known example at Barnack, in Northamptonshire; and there are many more in remote parishes in different parts of our pleasant land.

We have a much larger number of early Norman windows. They are narrow slits, five or six or seven inches wide, with semicircular heads, and vary in length from a foot and a half to three or four feet, and are so splayed through the thickness of the wall towards the interior as to admit as much light as possible with these external limitations. As time went on and security was more assured, window-openings became larger and larger. Their semicircular heads were surrounded with mouldings richly carved with ornament; and in

cathedrals and castles, two of them were sometimes placed side by side and made into one by a larger arch that encompassed them both. A century or so later, longer single lights or lancets were used, and then grouped together in similar couplets, and, as frequently, in triplets. By this time, however, the soft curve of the Norman builders was abandoned, and pointed arches were used for every purpose, including window-heads.

By degrees these lancet windows were widened so considerably that the glass placed in them required support, and mullions were invented. The multiplication of mullions left spaces in the window-heads to be filled with tracery, which was designed with as much geometric beauty as was possible to the builders. Circles cusped, or lined with semicircles, presented a petalous appearance as of flowers, roses or marigolds. The isolation of these roses or marigolds in the apices of gables was the creation of the rose or marigold window, of which the wheel-window is but another variety. Still later, when our cathedral windows were filled with flame-formed tracery, the fronts of some of our domestic buildings came to be little more than tiers of windows. There are several of these old houses to be seen in many of our old country towns. Newcastle-upon-Tyne is especially rich in them. The mansions of the great were also nearly all windows when this fashion prevailed, as witnesses the local saying concerning Hardwick Hall, in Derbyshire, where Mary, Queen of Scots, sojourned for a time—'Hardwick Hall, more glass than wall.' The aim appears always to have been 'more light;' and transverse lengths of masonry, called transoms, became indispensable for the security of the large expanses of glass set up.

Our largest window is the east window in York Cathedral. This is seventy-five feet high—or more than the height of twelve men one above the other—and thirty-two feet wide. It rises to the full height of the stone groined roof, and is truly a majestic masterpiece. It is said to be the work of John Thornton, a Coventry glazier, in 1405. He had before his eyes the superb fenestration of the chapter-house, the house of houses, concerning

which Æneas Silvius wrote, its 'walls of glass are held together between columns very slender in the midst,' but still we must accredit him with a grand courage of construction. He made eight noble mullions which rise in straight slender lines to a wide transom, so corbelled out as to be wide enough for a footwalk, and thence pass upwards till they arrange themselves under three pointed arches, over which there are tiers of geometrical configurations culminating in the apex. There are about two hundred compartments thus formed, which are filled with stained glass depicting leading events in sacred history. Yet, notwithstanding this incomparable grandeur, many return to the five fine pale lofty slender lights in the north transept, called the Five Sisters, with undiminished pleasure in their grace and legends.

The east window of Carlisle Cathedral is a formidable rival of that of York. Looking at both, as we may now, within the space of a few hours, their points of agreement and diversity are striking. The Carlisle tracery is more branchy and leafy, more evenly distributed, and contrives to adapt itself more insinuatingly into the given space. This window measures thirty feet in width. The central division rises in leaf-like outline to the key of the arch, full of quatrefoils and leadlet forms; and the two outer divisions fall into the configuration of pointed arches, also filled with ogee-formed tracery. It is claimed for this design that it is the most beautiful in the world.

One who is accounted our leading art critic, however, has placed the west window of Dunblane Cathedral as the finest in the world. And the situation of Dunblane is so lovely, that if there is any foundation for the theory that the mind is acted upon by its surroundings, this supremacy could scarcely have been otherwise.

Apart from splendour of size and accessories of environments, many of our village churches have windows of endearing beautifulness. Sometimes they arrest us by their exquisite simplicity, sometimes by their consummate and venerable delicacy, always, of course, by their absence of pretence. There is a little silver-gray church, or chapel, at the foot of a wide hill on the top of which a tribe of ancient Britons have left a vast entrenchment, called Old Bewick, in Northumberland, which is a case in point. This little edifice lay unroofed, and consequently in ruins, for a couple of centuries or so, and thus acquired on the interior faces of the walls the same soft gray tones that weather alone generally gives to the exterior. It is now re-roofed and in use again. And in the apse at the east end is a tiny hoary loophole of a window, just sufficiently wide to admit a streak of light upon the altar—the same, we may be sure, that was put there by the early evangelists who reared the structure in the dim beginning. In Widdrington Church, in the same county, are five windows placed in the structure in those old knightly days when geometric configurations were giving place to more flowing forms. One of them, at the east end, is divided by mullions into three lights over which a cusped circle rests on two flowing quatrefoils. The others, which are in the mellow south wall, are square-headed with label mouldings over them, and likewise filled with trefoils having similar drooping essaying curves. Square-headed windows are not uncommon, as we may see in St Clement's

Church, Sandwich, and elsewhere; but of this particular transitional period they are rare. In the same county there are many other instances of beautiful windows in remote village churches, tall, stern, straight, admonitory lancets, appealing in the briefest manner to the highest thoughts; and others of softer and more persuasive influence fraught with tender curves and intertwinings: all the work of those who have lived before us and left them for our inheritance.

There is an old saying that it was never dark in Jarrow Church, which is believed to cover the claim made by historians as to glass being first used in the windows of that edifice. Until glass was introduced, the winds and rains were kept out by shutters, or by perforated stone slabs or panels. We may occasionally see some of these perforated panels retained in towers. There are some in Cromer Church, in Norfolk; and another in the tower on the island of Iona, not belonging to this early period, but survivals of their usance.

The windows of Carnarvon Castle may be taken as fair samples of military fenestration in Plantagenet times. Here, besides slits and crossbow loopholes, are long narrow shoulder-headed lights a foot wide, as straight as arrows; there, is a set of three couples of shorter square-headed lights forming but one; farther on, is a more curious arrangement of four smaller shoulder-headed lights, ten inches across, whereof the bases of the upper two are formed with the same shoulder-like outline, all cunningly strong and secure; and again we have the wider, lighter, more attractive double cusped lights with quatrefoils in the pointed heads, some with, some without, transoms. When we think of Edward I. and Queen Eleanor, bronzed perhaps by their expeditions to the Holy Land, or tired and harassed with their long journeys, looking out from them upon the mountains and streams they determined to call their own; of the Welsh princes looking up to them defiantly; of the bards who took the fact of their invincibility to heart; of the brave men who defended them from within, and those who assailed them from without—every stone is of interest. In some of the windows in the towers of Alnwick Castle there are stone seats built through the great thickness of the walls on either side of them.

Perhaps the most fascinating of all windows are oriel. Dormers are capable of much quaint and cosy expression, as we may see in such old-world towns as Ruthin, where some of the house-roofs have as many tiers of these 'eyelids' as those in old continental towns; but oriel are still more captivating. As the device was to the banquet in olden times, so is the oriel an extra enrichment to the already sumptuous feast for the eye in such buildings as Hampton Court, our old college buildings, and manor-houses. Whether they make central features over doorways and gateways, or light up odd nooks overhanging grassy quadrangles, or sunny gardens, or cool paved spaces, they always impart a surprise as well as a charm. Sometimes the name of oriel is given to bay-windows rising from the ground to the parapet of large halls. We are now referring, however, to the smaller projections at some height from the ground, supported on brackets, or on masonry gradually thrown out of the wall below for their reception. They are of varied forms,

but most frequently they are either semi-hexagonal, semi-octagonal, or semi-decagonal. There is a small oriel of three sides only at the topmost stage of a massive fortress-like tower adjoining Hulne Priory. This tower was built as an additional defence to the priory, besides its surrounding wall, wide enough to be manned in various places, by one of the ancient Percies. The oriel with its cusped lights and high parapet 'sits' upon large corbels which die into the face of the stalwart wall; and it watchfully overlooks the mount close by, fondly compared to Mount Carmel, the winding river, the distant hills, and all the convent buildings, now roofless and overgrown with ivy.

When we look into another aspect of the subject, and contrast the enormous lake-like sheets of plate-glass now in use with the old leaded diamond-paned lattices of bygone days, and not forgetting their jewel-like sparkle, picturesque appearance, and association with maidens' bowers, nor even their frequent setting of climbing roses, jasmines, and woodbines, we must own few things in daily use give a better gage of modern progress than our windows.

JOHN VALE'S GUARDIAN.

CHAPTER XXVI.

THERE was quite naturally a considerable hubbub and excitement in the district over a discovery which promised to change both the character of the inhabitants and the face of the country. Tobias felt himself to be the author of it all, and was windily eloquent in many bar parlours over eleemosynary rum and tobacco. What he did not know about the Great South Staffordshire Fault, he atoned for by a fluent invention, and he was looked upon in some quarters as quite a light of learning. Enormous crowds of sightseers flocked from the neighbouring towns to look at the outcrop; and on Sundays especially, Farmer Day's back garden was like a fair. At first he made an angry effort to drive the curious away; but learning, by the experience of a few hours only, how impossible that was, he surrendered himself to circumstances, and in the first week saw his garden trodden as clear of flowers and grass as if it had been a macadamised high-road.

After the necessary habit of the district, gangs of miners worked night and day. Some rough machinery was adjusted, and the foundations of an engine-house were dug in an adjoining field. Isaiah was a man of great importance, and was actually in conference with the traffic manager of the local line of railway with respect to a side-extension. Meanwhile, wagons drew the produce of the mine to the railway station, and the new coal being put upon the market was found to be of excellent quality.

The tide of good fortune touched Farmer Short-house with the rest, and bade fair to carry him into regions of prosperity which he had never so much as dreamed of inhabiting. He farmed his own land and owned the mines and minerals thereunder. Some one of his forebears had gifted the family with a pretty wide stretch of waste, and for this he was now offered what seemed to him extravagant prices. The offers warmed his

heart as well as if the money they represented had actually lain at his banker's. He had always been well to do, and was rather of a saving turn than otherwise; but under these new conditions he launched out a little, permitted Cecilia to buy new curtains and a new gown, executed a somewhat expensive change of horses, and gave himself the luxury of a new suit of clothes, blue cloth, brass-buttoned, cords with a primrose bloom upon them, and a pair of top boots. In his new raiment and his unexpectedly prosperous new condition, it came easy to the good man to think well of himself; and since to think well of one's self is with any honest and open nature the best of preparatives for thinking well of other people, the farmer was excellently satisfied with the world at large.

He was walking about his lands one agreeable afternoon, when, leisurely climbing over a gate, he beheld a trespasser. The trespasser had brought a camp-stool with him, had set up some species of framework in front of him, and was obviously engaged in some sort of occupation. It was impertinence enough that the man should have ventured on to the farmer's land at all in a place where there were no footpaths to warrant invasion; but that a man should actually set up his workshop, whatever his pursuit might be, on another man's land looked like the very crown of insolence. 'I'll have a talk to that feller,' said the farmer to himself. He took his walking-stick by the middle, and advanced at leisure, going softly and noiselessly over the grassy carpet. The stranger was so absorbed in his occupation, whatever it might prove to be, that he never so much as looked away from it for a moment. The farmer, indeed, was at his elbow before the man was aware of his presence. When he became so, he turned, and nodded with so sunny a smile and so evident and perfect an unconsciousness that his position there was in any way assailable, that the farmer was fairly nonplussed.

The stranger was painting, and the farmer, being a little puzzled as to how to begin his exhortation, stood by in silence, and speedily became so interested that he stood with rounded eyes and half-opened mouth and actually snored. The business was quite new to him, and the stranger, to his eyes, looked like an absolute master of his craft. There was a group of cows in the picture, and they looked like actual denizens of the fields. One of them, a white beast dappled with reddish spots, stood pensively facing the spectator, with its under lip awry, as if in the act of chewing the cud, and there was something so patiently and kindly bovine in its expression, that the farmer felt half inclined to caress it.

'How long has it took you to make that, young man?'

'Plait-il?' said the stranger. 'I beg pardon. What?'

'How long have you been over that bit of work?' He stuck out the point of his walking-stick towards the picture, and Jousserau warded it off.

'You must not—touch it,' he said. 'It is wet. I have been two whole day at that picture.'

'It takes a deal o' patience,' said the farmer.

'Oh no!' said the swarthy little man, looking up with his engaging little laugh. 'It takes not

patience if you are lover of it. It is the night, when I cannot work, that takes me patience.'

'Do you make a living at that sort of work, young man?' the farmer demanded.

'Yes,' responded Jousserau. 'It is my trade.'

'Funny occupations there is in the world,' said the farmer contemplatively, and again stood by in silence to look on. He became so devoutly interested that he followed all the dexterous motions of the brush with lollings of the head this way and that way, accompanied by elaborate motions of the tongue, as if by that motion he guided the movements of the artist's hand. When the little man had worked with great industry for perhaps half an hour, he laid down his palette upon the grass, and having rested the tips of his brushes delicately on its edge, began to roll a cigarette in his little brown fingers. This operation was also new to the farmer, who began to think that he had lighted on a creature altogether strange and remarkable.

'What do you reckon to get for a harticle like that?' he asked, pointing his stick once more towards the picture.

Jousserau put his head on one side and surveyed his own work critically. 'Not much,' he answered with candour. 'It is not worth much. At this I am beginner. There are many sorts of painting—many, and this I do for to amuse myself alone. To my own trade, I paint the face; that is my proper work.'

'Oho!' said Shorthouse, and instantly being genially filled with a sense of his own competence, began to turn over an idea in his mind. An idea, with Farmer Shorthouse, was something of a rarity, and it was always a bit of a wonder where it came from. The present notion was altogether novel and fanciful, but it tickled his brain agreeably, though it excited a certain bumpkin sense of bashfulness. The late Mrs Shorthouse, who had been a pretty woman in her time, as Cecilia's mother had an ample right to be, had been painted years ago by a travelling artist. Her portrait still hung in the seldom used best parlour, with a yellow gauze about the gilt frame to preserve it from the flies. It represented an amazing wooden simper, with a bulb of hair and a prodigious high comb on top of it, and on either side a short curl, like a neatly arranged black shaving. The subject was attired in a long bodiced gown, apparently made of court-plaster, with leg-of-mutton sleeves; and at the bottom of the picture a pair of hands which might have belonged to a magnified wax doll were mechanically crossed one over the other, with a chrome-yellow ring on every finger. The memory of this work of art came clearly into the farmer's mind, and the new idea was to have his own presentment put upon canvas as a pendant or companion to it. The two, he thought, would make an excellent heirloom for the girl. But if he were painted at all, it crossed him that he would like to be painted in his habit as he lived, and not in that cold stately company splendour in which Cecilia the first was represented. That was well enough for a woman, for it stood to nature that women should be fond of state and finery. For himself, he would go as far perhaps as the new blue coat with the brass buttons, but he would mollify that glory by the introduction of a jug of home-brewed with the foam upon it and a long clean

Brosely. Then he thought of the cords and the tops, and the longing seized him for a full length, but that seemed almost too much. There was a vanity of ostentation in it which frightened him. He would have it cut off somewhere about the finish of his portly waistcoat. And being on the question of waistcoats he thought of the red plush; that, with a gold Albert chain across it, would look no less than imposing.

'You mek a trade o' portrait-painting, eh?' he said after a long silence.

'Yes,' returned Jousserau, 'that is the work I do best.'

The farmer hesitated, fluttered, resolved, withdrew, resolved again, withdrew again, and then made the final plunge. 'If you don't happen to be particular busy,' he said, 'I'd like ye to come up to my house and have a look at the portrait o' my missus. It's been i' my mind for some time to have my own done to set alongside of it. I've got a datter as'd be glad o' summat to remember me by.'

'So, yes. I will come,' said Jousserau; 'I will come presently, in half an hour.'

'You're a foreigner?' said Shorthouse, after another pause.

'That is true,' said Jousserau, with one of his quick smiles. 'I am foreigner here. You would be foreigner if you were in my country.'

The farmer was staggered into silence by this amazing proposition: that he, a Briton born and bred, reared in the very heart of the English midland, could by any stretch of fancy be considered a foreigner anywhere was almost beyond him. 'I shouldn't belong to the country, to be sure,' he made answer; 'but as to being a foreigner'—

'It is only not belonging to a country,' Jousserau answered, 'that makes foreigners.'

That sounded as if there were something in it, but the rustic intellect was perplexed. Ideas were growing too common with it. The farmer was conscious of a plethora, a feeling of mental indigestion. 'There's different sorts of foreigners,' he remarked a little later, manfully wrestling with the new theme. 'There's no offence meant, young man, but what sort be you?'

'I am Frenchman,' said the little artist amiably. 'I come from Arles. You do not know of him? No?'

'No,' said Shorthouse; 'I never heerd of it.'

There the conversation ended; and Jousserau went on with his work for about the promised half-hour, and then, having packed his easel and camp-stool into a convenient little parcel, put up his palette and brushes, took his picture by a strip of canvas at the edge and announced himself ready.

'Be you a-living hereabouts?' Shorthouse asked, by way of renewing the conversation.

'Yes,' answered Jousserau; 'I am lodger with Mr Vintare.'

'Who's he?' asked Shorthouse. 'I know most of the folks hereabouts; but that name's strange to me.'

'Mr Vintare,' repeated Jousserau—'Mr Isaiah Vintare.'

'Oho! Ay! ay! Isaiah? I know him, of course; but you sounded the name so strange I could make nothing on it.—So you're living with Isaiah Winter, eh?'

That would be handy for the portrait-painting, if anything were to come of it, for Isaiah had set up his habitation within easy walking distance of Shorthouse's house.

The farmer led the artist to his house, and ushered him into the best parlour. It was a sombre chamber, chastening to the spirit in its gloom, its vault-like odour, and the prim, unused, and awkwardly regular array of its furniture. It was as unhomelike as an upholsterer's shop, but on company occasions among men of Farmer Shorthouse's class it is not *en règle* to be at ease. A little discomfort in respect to posture and shirt-collar would seem to be peculiarly desirable.

'Theer's the portrait,' said Shorthouse, when he had drawn the heavy curtains aside from the window and had admitted a little of the outer light. 'Now do you think as you could do anything like that?'

The artist stood looking at the work with a serious face. 'No,' he said; 'I do not think I could do anything like that, even if I tried. I will do you something a leetle better than that, if I do for you anything at all.'

'These things,' said the farmer, pointing to a daguerreotype on the mantel-piece, 'is good for nothing. I don't want to go down to them as may come after me mekin' 'em believe as their grandfather, or maybe their great-grandfather, was an 'Ottentot.—Look at that, now; who'd tell that for a pretty gell's picture? A pretty gell her is, though, though I say it. That's my dafter, and about as much like her as choke's like cheese.'

'Ah!' cried Jousserau, turning quickly, 'you are then Mr Short-house? Ah yes! I have met the young lady with my boys.'

'Like enough,' the farmer answered, not quite comprehending him.—'But now, tell me what you'd charge me for a picture of myself, drawn natural and coloured, the same size as that? I'm not a man to beat any tradesman down in his price, but I look to you to be reasonable.—I paid ten pounds for that un, and the man as did it sent it home without the frame. He said that was the way of the trade, and so it may be for all I know. I'm game to pay a ten-pound note for mine, that is if it's drawn and coloured natural. If it's as like nature as them cows, it'll suit me all over.'

Jousserau would probably have asked for a good deal more than the farmer was disposed to give, in which case the negotiations would have been brought to an immediate close; but the sight of the daguerreotype and the news that Cecilia was the farmer's daughter had an influence upon him. Truth to tell, this young southern gentleman was unusually susceptible, and Miss Shorthouse in a single interview had made a considerable inroad upon his fancy. It would be pleasant to meet her again, and that ox-like head of the farmer's would make an excellent study. The reflection decided him. He was in no immediate want of money, and he need not go about making a practice of painting farmers on their own terms.

'You'll oblige me with your name, if you please, young man,' said the farmer; and Jousserau produced and handed to him a card with a little flourish of politeness.

'Ah!' said Shorthouse, settling his glasses on

his nose to read it, 'that's convenient and comest-able.—Pretty handwriting.' He conceived the copperplate inscription to be the artist's own handiwork, and nodded over it approvingly. 'It's a sensible thing,' he said, 'when a man's got a funny name like that to have it wrote down ready. It's convenient to strangers.—And now let's settle about the time when it'll be handiest to have the work gone on with. If you're a early riser, young man, I'll give you from seven to nine every morning till it's done.'

'That will do,' said Jousserau. 'I will go to-night to the town and will buy a *toile*—what you call it?—a cloth, to paint upon, and I will begin to-morrow morning.'

'Right,' said the farmer. 'That'll suit me proper.—Mind you, mister, it's to be done on approval.'

'I shall paint your portrait,' said the artist, nodding his head with great gravity, 'and I shall paint it like you, and I shall paint it well. What I cannot make, I do not pretend I make.'

They went back to the kitchen, through which they had entered, and there found Miss Cecilia, bending interestedly over Jousserau's cattle-piece. He had placed it by chance in a good light upon one of the kitchen chairs; and the girl having drawn another seat towards it, was absorbed in its contemplation. She heard and recognised her father's step, and spoke without turning: 'What a pretty picture, father! Have you bought it?'

'No, my gell,' he answered. 'It's this young man's handiwork. He's made a bargain to paint my portrait, to hang up alongside mother's.'

Cecilia rose in a little becoming confusion, and Jousserau bowed to her, quite in the grand manner. Cecilia dropped him a little courtesy.

'Charmed once more to meet Mees Short-house,' said the artist.—'I must go now to buy my cloth. I will be here to-morrow.' He gathered up his belongings, bowed once more, and was gone.

'Why, Cecilia!' cried her father, 'you curcheyed to the young man as if he'd been a lord.'

'Mr Jousserau is a gentleman in his own country, father,' returned Cecilia. 'A real artist is a gentleman in any country.'

Here again was yet a new idea for Farmer Shorthouse. He said nothing, but he felt as if things in general were shaken and uncertain.

ENGLISH ELEMENTARY SCHOOLS.

WHAT is known as the Educational Code is a document of exceptional interest and importance to those who have any regard for the educational welfare of the kingdom. The full title of this document is, 'Code of Regulations, with Schedules, by the Right Honourable the Lords of the Committee of the Privy-council on Education.' Technically, it is known as 'The Code for 1889,' or more briefly still, 'The New Code.' Though it is a comparatively small pamphlet, consisting of only nineteen pages folio in large type with ample margin, with a dozen additional pages of Schedules, it includes in itself a whole code of laws closely affecting the most important interests of the nation. Under its provisions the largest army this empire has ever organised, lives, moves, and has its

being as an organisation. This army—to continue the simile—is commanded, in England alone, by three hundred field-officers, bearing the respective grades of Chief Inspector, Inspector, Sub-Inspector, and Inspector's Assistant. Of commissioned officers, in the form of certificated teachers, there are forty-four thousand, with another eighteen thousand of subordinate rank as assistant teachers, and three thousand five hundred cadets, or students in training. The non-commissioned officers, technically known as pupil teachers, number thirty thousand. The full complement of the rank and file is five and a quarter millions, of whom over four and a half millions are enrolled, while fully four and a quarter millions are paraded at the annual examination, these being divided among thirty thousand different companies or 'departments.' To maintain this vast army, fighting against the powers of ignorance, the nation expends annually three and a half million pounds.

The Code* deals with everything pertaining to the educational life of this army. No interest is too important, no detail too insignificant, for it to take cognisance of. It inquires into the date of birth of the youngest toddler who for the first time crosses the threshold of a school, and is equally curious as to the exact university degree of the wrangler who may be appointed an inspector. All sorts and conditions of schools come under its authority. The struggling village school in the most remote dingle where the modest successor of the poor 'hedge schoolmaster' of a past generation rules as absolute monarch over three or four dozen children; the enormous institution in the metropolis, with its palatial block of buildings, providing accommodation for two thousand children; and the still more imposing 'higher-grade school,' every member of whose staff boasts a university degree—all alike acknowledge the sway of this terrible 'Code.'

So important a document as this is not to be lightly conceived, nor, when once prepared, to be heedlessly or without careful consideration adopted as the educational law of the land. Due formalities have to be observed in its production. Minds specially trained by long experience of official life draft it, legal luminaries revise it to make the confusion of its multifarious provisions worse confounded by technicalities and wordy ambiguities. Having received the imprimatur of two members of the ministry of the day, it is then presented to both Houses of Parliament by command of Her Majesty. Here it lies on the table for a month, subject to the criticism of friend and foe, and open during that period to revision or amendment. This ordeal having been passed, the Code forthwith becomes the law of

the educational world, and, like the laws of the Medes and Persians, cannot be changed—for twelve months. There is an annual reissue, and each fresh edition contains more or less numerous and important amendments or modifications upon the preceding one, so that what may be enforced one year may be forbidden the next, and what was a virtue in 1888 may be a delinquency in 1889, and *vice versa*.

It will be evident, therefore, that the annual appearance of the Code—which this year comes into force in August next—is watched with both interest and anxiety by a large and important section of the community. For a period of over two years a Royal Commission has been engaged in inquiring into the working of the Education Acts in Southern Britain; and pending the appearance of their Report, the annual tinkering to which the Code was wont to be subjected was to a great extent suspended. Advantage was also naturally taken of the inquiry by a number of different educational organisations to place their views before the Commission.

As the present issue of the Code is the first which has appeared since the Commission presented its Report, it can readily be understood why its publication was so anxiously expected, its provisions so eagerly scanned, and why there is in the country such general interest displayed in a document so purely formal.

Few, however, of the general public would be able to benefit very much by a perusal of the Code itself. Its ramifications are so intricate, the bearing of one clause or section upon another with which it appears to have no necessary connection so important, and its technicalities so numerous, that it requires a trained mind to understand its real significance. Even a lawyer accustomed to the verbosity of legal documents would find himself at fault if he endeavoured to interpret the Code without some technical knowledge of the subject as a specialist. A celebrated judge before whom was recently tried a case turning upon the interpretation of the Code, declared in open court that its intricacy utterly baffled his powers. In further illustration of this fact, I may say that an important organisation which had placed evidence before the Commission, and expected to find effect given in the Code to the recommendations contained in the Commissioners' Report, were grievously disappointed at the small amount of concession granted in the Code. They entered a strong protest, backing it up by organised parliamentary pressure on the Department. Now, though this organisation numbered among its leaders several members of the legal profession, together with ex-inspectors of schools, principals of training colleges, elementary schoolmasters, and others who had spent years in working under previous Codes, and to whom the interpretation of the document might be supposed to be a matter of comparative ease, they were all baffled; for, on approaching the Department with their complaint, they found, to their no small surprise, that by the comparison of two widely separated articles in which a few verbal alterations had been made, changes so important had been introduced as amounted to a concession of nearly all they had demanded!

It is satisfactory to note that there is in the

* It will be understood that the Code spoken of in this article, as well as the figures above given, have reference to England and Wales alone, and not to Scotland, which has an educational system and Code of its own.

present Code an evident attempt to bring common-sense to bear upon the school requirements. For instance, in the infant classes—for children under seven—where certain specified courses in reading, writing, and arithmetic used to be required, Kindergarten amusements are now largely substituted, and the child is amused instead of being abused while undergoing instruction. The perceptive faculties are trained while the memory is not in danger of being overburdened or the brain over-taxed. Formerly, too, it used to be the custom to compel little boys to become so many infant tailors, by requiring them, while still under seven years of age, to make daily use of needle and thread, and to pass in sewing at the annual examination! There might have been some reason in this, from a bachelor's stand-point, if the requirement had extended to the period of adolescence; but to compel a boy to use needle and thread up to seven years of age and then to discontinue the practice for ever, was irrational. The absurdity has evidently been brought home to the framers of the present Code, and these infant tailors are disestablished, the lads being now engaged in elementary drawing upon slates while their sisters are employed in sewing. Another very practical feature in the Code is the special encouragement given to the study of cookery both theoretical and practical, and the arrangements whereby a number of small schools may combine in supporting one central class for instruction in science. All these are features which will recommend themselves.

But the pupils are not alone interested in the Code; the teacher is affected by it too. Let us suppose, for instance, that a parent wishes to bring up his boy or girl to the scholastic profession, the question naturally presents itself how shall this be done?

The course of preparation nominally begins at thirteen years of age, but really two years earlier. A boy or girl being over thirteen years of age, wishing to become a pupil teacher, has to undergo an examination. This is of a very elementary kind, and consists of reading a passage from one of Shakespeare's historical plays or from some other standard author; writing a short theme or letter on an easy subject; working correctly a few sums in vulgar and decimal fractions, simple proportion, and simple interest. Formerly, it was necessary, in addition to passing this examination, also to pass satisfactorily an examination in English grammar and in geography or history. In place of these, however, there will now be accepted a certificate from the managers of the school that the candidate has been for the two previous years instructed in any two of these.

This preliminary test having been successfully borne, the youthful aspirant is registered as a 'candidate,' and has then to undergo a probation of twelve months. During this year of probation, the lad or lass of thirteen is supposed to have charge of a class of twenty children. At the end of the year, another slightly more difficult examination has to be undergone, the chief difference being in the increased requirements in arithmetic. A certificate is also demanded from the managers as to the necessary instruction in some two Class Subjects.

Assuming this second examination to have been passed, and the year of probation to have proved

satisfactory, an indenture of apprenticeship is drawn out, changing the 'candidate' into a 'pupil teacher,' and binding him or her to serve for four, or in some cases five, years at an annual salary agreed upon between the parties. During this term of apprenticeship the pupil teacher counts on the school staff as sufficient to teach thirty scholars. At the close of each year the pupil teacher has to undergo a fresh and more difficult examination, greater strictness being observed by the inspector at the end of each of the first two years. If a pupil teacher fails to pass satisfactorily in the subjects of the first and second years, he or she may, with the consent of the Education Department, be re-examined once, when, if the pupil teacher ultimately fails, the engagement is peremptorily terminated, and the disappointed candidate for scholastic honours must seek an opening in some other profession. Formerly, the pupil teachers of a district were wont to be summoned together to some common centre for the purposes of this annual examination, and in the case of remote country districts, this often entailed no little hardship. Now, this is no longer necessary, the teachers being examined at the schools in which they are engaged. While this favours the pupil teacher in one sense, it entails a corresponding hardship upon the head teacher, and even upon the pupil teacher; for the former has to cope with the difficulties of the exceptional circumstances of an examination day without any assistance from his ordinary staff; while the pupil teacher, being engaged in working his own examination paper, is prevented from superintending, as he was wont to do, the examination of the class he had been teaching throughout the year, and is consequently deprived of the opportunity of seeing with his own eyes the weak points in the instruction which may appear under a searching examination by a trained inspector.

The apprenticeship being happily terminated, there is yet a further ordeal before the doors of the profession are finally thrown open to the applicant. Three courses are now open for the candidate, who may choose either to become a student in a training college, to undergo two, or in exceptional cases three, years' further preparation for the profession; or to seek employment as an assistant teacher in an elementary school; or to take sole charge of a small school of less than sixty children. Until recently, these last two courses were open to all pupil teachers who had passed their fourth year's examination satisfactorily; now, however, they must also pass what is technically termed the 'entrance examination,' which is held annually in July at a number of centres, and which lasts for three or four days. Those who do well at this examination enter the residential training colleges, where they are lodged and boarded for a nominal sum, and receive their tuition free as 'Queen's Scholars;' or they may be enrolled as students at day training colleges or university colleges, where their tuition fees, together with a small sustentation allowance, are provided for them by the Education Department. This last is a new and much valued provision, which, though it has long been in force in Scotland, is now for the first time introduced into the English Code. As the colleges naturally choose those who stand highest in the pass lists, and as

the accommodation at these institutions is necessarily limited, a large number who may be able to pass barely, will find themselves excluded from the training colleges. For these, as well as for those whose limited means make it impossible for them to spend two years earning no wage, the remaining avenues of assistantships, and of teacherships of small schools, afford means by which they may yet attain the coveted teacher's certificate. Whether they be students in training, or acting teachers perfecting themselves for the profession by a course of self-culture or private study, two more examinations await them. These are known as the first and second year's college examinations. The present Code demands that each candidate for a certificate should pass both these examinations; whereas, formerly, if either of the two were successfully passed, a certificate of competency would be issued. Admission to the profession is thus rendered increasingly difficult.

The would-be certificated teacher's trials are not yet over. Even after passing the long and imposing array of nine examinations in as many consecutive years, the last hill has not been climbed. There yet remains a period of at least two years' further probation in actual school-work, when, if the inspector reports favourably upon the teacher's practical skill, and satisfactory results are obtained by the school or class under the probationer's charge, the much-coveted 'parliament,' as the certificate is called, is finally issued, and the youth or maiden is henceforth classed as one of the forty-four thousand certificated teachers approved by the Education Department.

Taken as a whole, the present issue of the Code, while retaining some objectionable features, may be regarded as a fair and honest attempt at solving the educational problem for England and Wales. The use of the word 'Wales' in this connection reminds us that the inhabitants of the Principality will probably give it a warmer welcome than will any other part of the kingdom. It appears that the Celtic tongue is still spoken by fully two-thirds of the million and a half inhabitants of that portion of the empire, and the native language is now for the first time officially recognised as available for school purposes. Managers of schools are allowed, if they think fit, to teach Welsh reading, writing, and grammar, with the geography and history of Wales, by means of bi-lingual reading books. This means a course of bi-lingual instruction, not only possessing exceptional attractions and interest for the Welsh people, but also of such high value as an intellectual training as should enable Welsh schools to turn out better material than is possible for English schools, restricted as they necessarily must be to a single language. The advantages, intellectually, of a bi-lingual training are too evident to need demonstration. This concession to what appears to have been a popular demand in the Principality, contains the germ of a principle which other districts would do well to emphasise—namely, that of granting districts widely differing in their circumstances and educational needs the right to decide for themselves their actual course of instruction. It is evident, for instance, that much of what might be suited to the needs and circumstances of a large and well-fitted school in such manufacturing centres as Birmingham, Man-

chester, or Sheffield, would be out of place for a small school in the Fens or in a remote Devonshire valley. Yet, under existing conditions, a child has to undergo precisely the same course whether he live among the peaceful surroundings of an agricultural neighbourhood, or in the ceaseless rumble of machinery in the manufacturing centre, or the murky atmosphere of a mining district, each of which possesses its separate and distinctive interests.

NABOTH'S VINEYARD.

CHAPTER IV.—CONCLUSION.

COLONEL SANDHURST returned to his hotel in a very thoughtful frame of mind. He was wandering in spirit through long-forgotten scenes, and ghostly faces rose out of the past to trouble him. Thirty years, twenty-five years—a long time ago, and yet it seemed only yesterday that he and Margaret Hay were together, before she learnt that wealth and position were better than love and honour. And yet she had shown no sign of repentance, rather had assumed the position of an injured woman. Perhaps he had been too impatient, perhaps some treachery had been at work. Again, she had treated him with such marked scorn throughout the interview. Altogether, he felt strangely small and humiliated; nor did he expect any extraordinary amount of sympathy from Ethel Morton or Frank in his unexpected defeat.

Nor was this gloomy anticipation a mistaken one, for the lady in question openly expressed her opinion that nothing could have turned out better; indeed, the loss of so much wealth was hailed with a positive expression of relief. The Colonel, who inclined to be somewhat angry, grimly inquired what Cresswell thought of the change in his fiancée's fortune. But that individual appeared to be in nowise distressed. On the contrary, he took the matter with a coolness that fairly exasperated Colonel Sandhurst, who was at length driven to retort.

'My dear fellow,' said the baronet, in reply to certain scathing denunciations anent this fatuous disregard of common prudence, 'Ethel is quite right, as no one knows better than yourself. Besides, it is a great mistake for young married women to have command of a lot of money. It creates a feeling of independence. And if we had all that abundance, we should only spend it, you know.' To which foolish not to say flippant speech Colonel Sandhurst deigned no reply.

The arrival of Mr Heath soon after dinner was a positive relief to all, and infused a brighter spirit into the somewhat solemn proceedings. 'A most extraordinary thing,' said he, when at length alone with the Colonel. 'You remember my telling you this morning that I had already commenced to draw the conveyance of Fernleigh? There are a lot of old deeds in the box, and in idly turning them over I found the assignment.'

'What! Amongst my deeds?'

'Amongst your deeds. At the very time that Fernleigh was mortgaged to you, the missing documents must have been hidden under those old parchments.—But,' continued the lawyer, lowering his voice, 'I found something quite as singular still—nothing less than a letter addressed to you, and evidently in Mrs Charlesworth's handwriting.'

'You are romancing,' returned the Colonel quietly, though he was conscious of a quicker throbbing of his pulses. 'There was a time when she might have written to me, but that is a quarter of a century ago.'

It was Heath's turn to look puzzled now, though he said nothing, merely drawing from his pocket the letter in question and handing it over to his companion. It was yellow with age, the ink faded to a pale red, though otherwise clean as it had been the day it was written.

The Colonel perused it carefully twice through, then turned to his companion. 'Heath,' said he with the same quiet inflection, 'had that letter fallen into my hands when it was intended to, Margaret Hay would have been my wife.'

'Your wife? I did not know that you ever knew her.'

'Nor did I, till I met her to-day. Perhaps it is singular that we never came together in all these years. We first came together during a London season. Up to a certain point, you will be good enough to imagine the rest. Her father did not like the idea; but one thing he agreed to. "If," said he, "you will not see my daughter for three months, or correspond with her, and at the end of that time she is of the same mind, I will give my consent." Need I say that I consented in my turn. We were young and romantic then—too much so, as subsequent events proved. At the last day of the three months she was to write to me and tell me to come. But she never wrote. I am not going to tell you any more, except that this is the letter I ought to have had. Read it.'

Mr Heath put on his spectacles and read the simple note:

MY DEAR GEORGE—The three months expired to-day. At five minutes past twelve midnight this letter is being written. Will you come to me and see if you think I have changed?—Ever yours, affectionately,
MARGARET HAY.

'How long, after this note was written, was it before Margaret Hay married her cousin?' asked Mr Heath.

'Two months to a day.—Rather a sudden change of opinion, you see.'

'Then, of course, Charlesworth got hold of it,' pursued the lawyer, ignoring the Colonel's implied arcasm. 'The very thing he would delight in doing. *De mortuis nil nisi bonum*, and all that sort of thing, but— When he got hold of the Fernleigh title-deeds, he must have laid the note there accidentally.'

'I wonder what she thinks of me?' said the Colonel suddenly.

'That you have behaved very well over this matter,' my dear fellow. And now that my hands are no longer tied, I don't mind telling you the same thing. You will find her very grateful for your intended kindness, which reminds me that I have a commission to execute. Mrs Charles-

worth is very anxious to see the young lady who would have believed so generously if she had had the opportunity. I am charged to ask you, as an old friend, to waive ceremony and take your party to Fernleigh to-morrow.'

'If he will not, we must go without him,' cried Ethel, who had approached near enough to hear the conclusion of Heath's message. 'And I don't think we shall have much difficulty in persuading Frank to join.'

'I daresay you would like to go without me,' said the Colonel with a pleased chuckle; 'but you won't, all the same.—Never mind the ceremony, Heath. I will send my man over with a note to-morrow morning, saying we accept Mrs Charlesworth's invitation with all possible pleasure;' to which Miss Ethel replied sententiously that wonders would never cease.

If there was one thing more beautiful to contemplate than the perfect weather on the following afternoon, it was the immaculate splendour of Colonel Sandhurst's attire, a fact that Sir Edwin Cresswell, himself no mean connoisseur in the art sartorial, did not fail to comment upon in confidence to the lady of his choice.

'Bingo the Earl, Chivalry's pearl,
Went a-philandering after a girl.'

she quoted, *sotto voce*, as they took their seats in the wagonette. 'Isn't it just too splendid? If we could only marry the dear old colonel to Mrs Charlesworth, we should have our romance complete.'

But for the exuberant spirits of Miss Ethel, and the quiet sallies of the equally happy baronet, the drive to Fernleigh would have proved a quiet one. Once within the gates, however, tongues were loosened, for the serene quiet beauty of the house brought an honest tribute of admiration to every lip; its peaceful silence seemed to soothe every heart and bear all unhappiness away. Even Ethel, as she found herself tenderly embraced by the mistress of Fernleigh, fell under the influence of the charm.

'We must all be friends,' she said. 'I feel very grateful to you all.—Gladys, why do you not speak to Miss Morton? There is no call for the usual formality.—Sir Edwin Cresswell, I once knew your mother very well. If you are anything like her, Miss Morton is a fortunate girl.'

The Colonel had already caught Vivian up in his arms, delighted that the child had remembered his soldier, Ethel looking at the boy in a sudden ecstacy of child-worship; while Gladys Charlesworth stood face to face with Frank as one who has found a pleasant dream to be the sweetness of reality.

'You have not forgotten me?' he asked.

'Oh no, indeed. Only, it seems so strange to see you here. The last time we met was all sickness and suffering; here, it is so peacefully quiet.'

'It is a beautiful place!' Frank replied, drawing a deep breath of admiration, and feeling almost dazed with the wildness of his own happiness. 'There is no wonder that you love it.' But tell me how it was that you left me so abruptly out yonder? Not even time to say good-bye, not even a moment to thank you for your angelic kindness.'

'Not now,' said Gladys hurriedly, with a quick frightened glance at the others' retreating figures. 'See; they are going into the gardens, my mother's favourite walk. Won't you come with them?'

But Frank stood perfectly still, looking down into the pleading face. 'Why did you leave me like that?' he repeated. 'Do you know that I have been searching all London to find your whereabouts?'

'Captain Sandhurst, I will tell you everything presently, only let us join the others now. Mother will be so disappointed if you do not see the garden with her.'

Captain Frank suddenly melted; he would have been something more than a man could he have withstood the wistfulness of those imploring violet eyes. So they went into the old-world garden; and under the avenue of ancient fruit-trees, Frank detailed to his hostess the story of his lingering illness away from home and friends—how an angel nursed him, and the manner in which that sweet divinity had been found.

'Your girl and my boy,' the colonel remarked musingly, as he watched the figures disappearing down the shady avenue. 'How strange it seems! It seems almost like the renewal of one's own youth.'

'It seems more strange that they should have met in such a way,' Mrs Charlesworth replied. 'They would make a handsome couple, George.'

The old name came so naturally that neither of them noticed it. The Colonel laughed lightly, wondering a little to find himself viewing such a contingency so complacently. Under the bending arch of the trees they sat, till the talk gradually veered round to old times long since forgotten, though none the less delightful of recall.

Meanwhile, Gladys and her companion had wandered on beneath the filbert boughs to a secluded spot, below which the sunny meadows sloped away into a far-stretching valley, beyond which rose range after range of wooded hills, crowned in the faint blue distance by the Malverns. In the quiet contemplation of this silvan beauty they were silent for a time, with that innate sympathy that exists between spirits of a kindred nature. There was a soft flush on the girl's delicate cheeks, a subdued content gleaming in her eyes.

'You look like happiness materialised,' said Frank at length.

She turned her glowing face to his, trembling with a sweet emotion. 'Almost too happy,' she replied. 'Yesterday was all dark and troubled; to-day is all joy and sunshine. Then it seemed as if we were going to lose home and everything almost that makes life worth living. I do not think I am very sentimental, but I have a passionate love for this place. Perhaps you cannot understand the feeling.'

'Yes, I think so. When I was ill, dying almost, out yonder I learnt to appreciate the meaning of home. I used to dream of it, more perhaps when you were by. When you left, I knew it *was* a dream. And that brings me to the old question: Why did you go away so suddenly?'

'What more had I to detain me? I had lost my brother; you had grown well and strong enough to do without me.'

'You think so?' Frank asked, with a dangerous

thrill in his voice. 'Perhaps I am the best judge of that. I was not strong enough to do without you, and I never shall be now.'

'I am glad you thought of me. It is pleasant to know that.'

'Thought of you! I have never forgotten you for a moment. Sweet hypocrite, dare you look me in the face and say it is not so?'

She did not look up, though a rosy smile trembled on her cheeks and ruddy lips for a moment. In spite of the tumultuous beating of her heart, there was in all the painful uncertainty an exquisite sense of pleasure which rendered it doubly pleasing.

'Gladys, if I may use the name again, tell me why you left without good-bye?'

For the first time she glanced up at him with her truthful eyes. 'I will tell you, then. In the first place, I thought you would despise me, and your regard was very dear to me.'

'Of course I should have despised you,' Sandhurst replied ironically—'the same as one would despise a heaven-directed angel sent to succour a despairing wretch. But, ah me, I quite forgot to do that because, you see'—

Gladys stretched out a trembling little hand imploringly. Immediately the bold soldier seized it and kept it imprisoned in his own warm grasp. At the touch of this strong masterful grip, all the reserve and coldness seemed to leave the girl yielding and helpless.

'But I thought you would,' she cried. 'I was only an hospital nurse; you are a soldier with a good name and fortune. I was always proud of being Miss Charlesworth of Fernleigh; but even then I did not know how long I could call myself so. And if you had met me some day, an obscure governess, or perhaps a shop assistant'—

'I should have lavished large sums on that blessed establishment in my excess of gratitude.—No; I will not release your hand, Miss Charlesworth of Fernleigh. You proud young person—isn't that the expression I should have to have used if I had found you in a shop?'

Gladys laughed, and said no more about her prisoned fingers. There was a wild flush on her cheeks, and a lustrous gleam in her eyes like unshed tears. As Frank looked down into them, a sudden flood of tenderness rushed into his heart, overpowering all other feeling. 'Gladys,' he said quietly, 'you were very cruel to me then.'

'Perhaps; but it was not without pain to me. I did not know'—

'That I loved you. I did, the first time I saw you. I do now; I shall as long as life is spared to me. Hear all I have to say. This is no passing fancy—remember, it is more than a year since we parted—and instead of growing weaker, my love becomes stronger every day. If I can do anything to make you happy, if I can—Gladys, my darling, will you be my wife?'

Then there came a long silence more eloquent than words, as heart went out to heart in a perfect understanding. It seemed as if the parting of a year had been washed away with its months of doubt and uncertainty, as she lay upon her lover's breast with his arms around her. Woman-like, Gladys was the first to break the stillness, with a broken laugh and a strangely happy face tinged with a shame at her own beatitude.

'I wonder what they will say?' said she. 'Mr

Heath told us yesterday that you and Miss Morton were expected to?—

'To fall in love with an obsolete family arrangement,' cried Frank gaily. 'My dear child, what chance could I possibly have with a full-blown baronet? Strange as it may seem, Ethel prefers Cresswell to me.'

'What shocking taste! And to console yourself, you came to me. I am afraid yours is only a secondary attachment.'

To which audacious speech Sandhurst replied by a rapturous embrace, in which Gladys' hat fell to the ground and her fair hair spread out in wild disorder. And, to add to the catastrophe, at this moment appeared the Colonel in company with the mistress of Fernleigh, eyeing the blushing culprits with an ill attempt at deep severity.

'I should like to know the meaning of this,' asked the Colonel, in his sternest parade voice. 'I should very much like an explanation.'

'It is simple enough,' said Frank coolly.—'Colonel Sandhurst, permit me to introduce you to my future wife.'

Mrs Charlesworth gave a little cry of astonishment, while the Colonel bowed with an exaggerated politeness, possibly to hide the pleased expression which somehow would manifest itself on his features.

'What shall we do with them?' he asked, turning to his companion.

'It is so sudden, so unexpected,' faltered the bewildered lady with a glance at the now collected lover.—'Gladys, what have you to say?'

'It is quite true,' said she, laughing and crying in a breath. 'He asked me to—to marry him, and I'—

'Well. And you?'

'Were obliged to say yes. He would take no other answer,' and Gladys kissed her mother once, and disappeared without another word, leaving Frank to bear the brunt of the paternal wrath, an impending punishment which he bore with enviable stoicism. Fortunately, the advent of Vivian at this moment served to distract attention from the culprit, who forthwith took the lad by the hand and set off in search of an imaginary wren's nest.

Mrs Charlesworth took a seat, the Colonel stood by her side.

'You are not displeased?' he asked with a shade of anxiety in his voice.

'Not exactly displeased; indeed, I think I am very glad. It seems so poetical that between our children there should be such a tender feeling. I think of this the more because there might have been'—

'As blissful a consummation for us.—Margaret, do you remember the time when you and I looked forward to such happiness, when at the end of three months you were to write to me?'

'And I did, George; do not forget that.'

'Yes, I know it now; but I did not receive the letter at the time. I waited for a month, but it never came. And then I thought you had forgotten me, so I troubled you no more.'

'And I thought you had forgotten me. How absurdly proud we must have both been not to—How did you find out afterwards?'

The Colonel took the letter from his pocket, and handed it to her. When she had read it, he told the story of its finding. But the history of

the treachery practised by a vanished hand he did not tell her, nor did she ever know.

It was blissfully quiet there, save for the song of birds and the light sound of voices on the lawn below. For a long time neither spoke, for the mind of either was back in the far past.

'Margaret,' said the Colonel at length, 'there is still a little fragrance over our dead romance. Can't we treasure up the remaining years to gether?'

'Last year's leaves are dead,' Mrs Charlesworth replied, blushing like a girl; 'their fragrance has gone for ever.'

'But the beauty springs afresh. I have been a lonely man; I shall be more so in the near future. The sunshine has gone, but its warmth still remains. If you can bear with me for a time, I shall be the happier.'

'Very well. It shall be as you wish, George.'

The sound of voices came nearer, till presently all the happy group had gathered round the colonel and his companion. When they became a little graver and the conversation had taken a more serious turn, he told them. They listened in respectful silence, while Vivian climbed on to the Colonel's knee, looking up into his face the while intently.

'What do you think of it all?' asked the narrator in conclusion.

'I think it will be very nice,' said the boy confidentially.

'You are pleased, Vivian?' asked his mother.

He looked from one to the other as if he saw them, then away round the garden, peaceful in the fading afternoon, pleasant, fresh, and sweet, as if the very guardian spirit of the place had blessed the garden and its denizens. A delicate light fell upon his face, filtered through the branches.

'I think it is the best thing that could happen,' he said in his quaint old-fashioned way; 'and I think,' he concluded, with a glance heavenward, 'that God has been very good to us all to-day.'

BIRD MIMICRY AND VENTRILOQUY.

UNDOUBTEDLY, the most perfect mimic amongst the feathered tribes is the American mocking-bird, a bird belonging to the Thrush family. On account of its wonderful powers of imitation, the aborigines of Mexico called it centeontlatolli—namely, four hundred tongues or languages. It is during the daytime that its imitative powers are usually exhibited; and so perfect is its mimicry of the songs of other birds, that even the most practised ear is easily deceived thereby. Although it has never been known to imitate the human voice, its powers extend to the mimicry of the cries and calls of other birds, the mewling of cats, the barking of dogs, cock-crowing, hen-cackling, pig-squeaking, creaking of hinges, and numerous other sounds.

The best imitator of the human voice is the parrot; but its powers as a mimic are so well known that we need not stay to enumerate them.

It must not be supposed that this faculty is confined to one or two species, for it is possible

that most birds are more or less endowed with it. Many of our British species are excellent mimics, and although by no means so proficient in the art as their foreign brethren, the term 'mocking-bird' might be very appropriately applied to not a few. The development of these powers frequently takes place when in confinement, the exercise of the faculty seeming to afford much enjoyment to the performer. Amongst the British birds which may be taught to utter words and short sentences are the magpie, jay, starling, and jackdaw. The first-mentioned of these, it is said, may be taught to speak almost as plainly as the parrot does; and the starling may be taught to say almost anything, as well as to whistle tunes. A goldfinch has been known to mimic to the life the chirp of the sparrow, the 'Spink, spink' of the chaffinch, the twittering of the swallow, the bell-like 'scold' of the blackbird, the notes of the oxeye tit, the bunting, the whitethroat, and the wren—in fact, any and every bird's cry that he had the chance of hearing during his ten years' confinement.

The bullfinch is a notable imitator of tunes, while the canary frequently reproduces parts of the airs that have been whistled or played in his hearing. There is on record a most interesting and curious case of mimicry by a canary. A gentleman having taken temporary rooms in a London lodging-house, was much disturbed during his first evening's stay there by the persistent striking of a clock (utterly regardless of time) outside his room. It became so annoying to him, that he opened the door for the purpose of calling his landlady, when, to his surprise, the sound suddenly ceased. Upon questioning the landlady, he found that the sound was made by a pet canary whose cage was placed in a window-seat outside his door. The imitation was so exact that it was impossible to detect the fraud by the ear alone.

Reculver Marsh, on the coast of Kent, is much frequented by lapwings and skylarks, the latter of which have adopted the peculiar and well-known alarm-cry of the plover. These birds are also imitators of the cry of the ringed plover. Professor Newton tells us of another imitator of the lapwing—the starling, who, moreover, has been heard to imitate the twittering of the swallow. Jays, again, are said to be able to reproduce the peculiar notes of the carrion crow.

There are very few persons who have intruded upon the nesting-ground of the lapwing who have not been deceived by the piteous cry and painful fluttering of an apparently wounded bird; for the plover is an excellent mimic in this respect, and by these means succeeds in drawing off the novice from her nested treasure. Titlarks, wild-ducks, wagtails, and sandpipers also thus exercise their reasoning faculties and powers of mimicry.

Death-simulation is a species of mimicry or fraud not unfrequently practised by birds when suddenly alarmed. The following is one out of numerous instances that might be cited: Some ten yards from her nest on Lough Neagh, a water-hen was discovered lying on her side, partly in the water, her head being concealed by one of the large loose stones which lay about the spot. The bird was picked up by the tip of the wing; and as its limbs were relaxed, and to all appear-

ance it was quite dead, the holder was about to drop it to the ground again, when, to his intense astonishment, the mimic suddenly flapped its wings and took to flight. The landrail has been known to simulate death in a similar manner, and under the closest examination it showed not the slightest sign of life. The pretence was continued until some time after it had been stowed away in the captor's pocket, when, with a sudden effort, it escaped from its prison and flew away as if nothing had happened.

Not only are certain individuals of the feathered tribes true mimics, but it is possible, nay, probable, that some few also are ventriloquists. Mr Rigby Withers tells us that during his wanderings in the forests of Brazil he discovered a bird-ventriloquist which has a peculiar shrieking cry as loud as a peacock's, and which is known as the Bell-bird. He thus writes about it: 'It is seldom seen in its wild state, being, like the musical frog, a ventriloquist of very high powers, and as a sun-loving bird, a frequenter of the highest tree-tops, where its snow-white plumage and transparent wings render it almost invisible even when in motion.' From a description of this bird's performances in confinement, it appears that its notes were heard in every quarter of the small village, and seemed at times to come from the mountains at the back of the village, fully a quarter of a mile away.

Mr Bowdler Sharpe tells us that one day in early spring, when in a wood near Mongeron, France, his ear was arrested by a loud and not unmusical cry like that of a titmouse. As the sound appeared to be close to where he was standing, he searched all the trees in the immediate neighbourhood, but could find no bird of the Tit family. At length, however, he discovered that the notes were produced by a creeper which was busily engaged in search of insect-food on a tree some ten yards away. The cry, he states, was ventriloquial, sometimes appearing to be uttered close at hand and sometimes at a distance.

Whether or not the cornerake is gifted with the power of ventriloquy, we do not know, but we well remember how frequently in our bird-nesting days we were deluded by this bird. Stealthily making our way along some hedgeside, we would be suddenly startled by the 'Crake, crake' of the landrail, seemingly close at hand. With 'cautious steps and slow' we would make our way through the long grass towards the spot whence the sound proceeded, when, as though the bird were gifted with the power of invisible flight, it would be transported to a spot some hundred yards away. Towards this we would cautiously proceed; but just when we appeared to be within a few feet, without a rustle, without a blade of grass stirring, and apparently without a pause, the monotonous 'Crake, crake' would be heard at a still farther distance. As we think of it now, we can distinctly recall the 'haunted' feeling we experienced as we stood in the meadow (it was evening) listening to the landrail's notes, which seemed to swell and die away almost to an echo, as does a peal of bells on a fitful breeze; and we are strongly inclined to think that the cause of the sound appearing to emanate from so many points almost at the same time is due to a ventriloquial power with which the bird is

probably endowed. The grasshopper-warbler and the ring-ousel possess similar powers, which are, doubtless, a means of protection to them, being used to lure away the intruder from their nests.

LONG JAKE'S TRIP HOME.

IN TWO CHAPTERS.—CHAP. I.

LONG JAKE had been indulging in his periodical spree. The fact first dawned upon him with the dawning day, when a heavy driving shower beat into the veranda and soaked him where he lay like a log. As the day advanced, the truth grew gradually sharper and clearer, and piece by piece he began to patch together those fragments of the past few days which still lingered, with blurred outline, in his memory. Yet, though his head ached again—perhaps from the mental effort, perhaps from other exciting causes—of the greater part of the time he was able to recall absolutely nothing. It was on Friday he had ridden into the township from his hut beyond Razorback, and, as a matter of course, parted with that thirty pound cheque to John Byrne, the publican: he was quite sure of that. It was now Tuesday afternoon, and John Byrne, the publican, had plainly intimated that the end of the spirituous tether which that cheque had secured was arrived at: alas! he was equally sure of this. But the interim was a nebulous void. Thus the knowledge that he had been four days drunk stole slowly into the blunted sense of Long Jake, as day steals into some cave deep in the mountains, forcing its laboured way through gap, rift, and crevice. But it was not until it came to catching and saddling his mare, with infinite difficulty and feeble vexation of spirit, that he fully realised and appreciated all that had gone on.

At last, however, he was in the saddle, sitting tight with thigh and knee, the upper part of him huddled into a ball. Not much of a man to look at, at any time; no grace of feature or of form; not even a really good seat in the saddle. Nothing of any account from head to heel. A small fresh-coloured face; crooked beard, turning gray; legs absurdly long in proportion to the rest of him, and that the shape of a bow. They called him Long Jake; for his ill-apportioned length was the man's sole individuality; and as for surname, it was never dreamed that he had one, either in this little township of King-parrot Flat or in the surrounding ranges.

'Well?' shouted John Byrne from the veranda that fronted his grog-shanty, as Jake rode round from the yard. 'So you're off, eh? And when shall we see you again? Not for another six months, I s'pose.—So long.' John Byrne spoke sadly, yet with the consoling certainty with which one augurs the return of summer while watching the falling leaves. For Long Jake was one of his regular sources of income—had been for years. To look at John Byrne as he stood there in his red shirt and cabbage-tree hat, tall and handsome as he was, you would never have taken him for a shark and a robber. On the contrary—though these terms, I assure you, would have been none too hard for him—you would probably have discovered in him a type of rugged, solid, honest manhood. At all events everybody else did—at first sight.

Jake muttered something profane but incoherent in reply, and flung a sulky nod to the knot of loafers in the veranda, who, having been drinking at his expense since Friday, returned it with an interest not dissociated from satire. Then he was off at a brisk canter, sitting, as some one unkindly observed, 'like a sack of coals;' and, though sitting close, swaying in the saddle every few strides, in clear indication that his balance was as yet imperfect.

Tenements, whether wood or canvas, were few enough at King-parrot Flat; but what there were lay wide apart on either side the broad bush highway, divided by clumps of gum and belts of wattle and wild fern; so that the township, which could have been set down in three or four acres just as well, extended from end to end nearly a mile. As Jake passed close in front of the opposition grog-shanty at the other side of the road, higher up, he was playfully hooted by a second—naturally hostile—knot of loafers. Outside Harrison's store, still higher up, the aged Harrison, who was sunning himself in front of the house, laid down his newspaper and broke into a cackle of senile mirth as the old horseman—whom he took for an Australian John Gilpin—thundered past. And little Martha Byrne, driving back the cows from the creek, made such an impudent, impish grimace in his very path, that Long Jake turned in the saddle with a more savage look upon John Byrne's child than he had hurled back at the grown men. Even the cows stood still to regard him with blank astonishment, as he clattered through their midst. There was only one house left to pass—a long, low, new building, more pretentious than any other in the township. It was the new store, lately opened by new arrivals in the colony; the bold venture of a young immigrant couple, and so far held in supreme contempt by the broad spirits of King-parrot Flat. Mrs Truscott—the township said unanimously—*might* be a fine young woman; they weren't so sure about that, however; but one thing they were sure about—she would have to get rid of those confounded 'old-country airs' of hers before they had anything to do either with her or her stuck-up husband. As for the latter, why, he actually thought he knew something about horses; as if a new chum in the colony *could* know anything about horses! And he had a young colt or two up there in his yards that he was breaking in, English fashion. Just fancy trying on that kind of 'rot' with bush-horses! King-parrot Flat thought it all an excellent joke, though one which—as men of 'savvy'—they could not help feeling strongly about.

Now the road to Razorback twisted abruptly round the corner of this Truscott's store; and after passing the store, Jake would be alike beyond the township and range of those arrows of ridicule to which an unsteady rider prescripts a gratuitous target. He therefore made no attempt to check his pace as he swept round close to the picket-fence in front of Truscott's veranda. Had he done so, he might have heard and understood the bounding thuds of a bucking horse, close at hand, before he doubled the angle of the fence and before it was too late to prevent a collision; for, Truscott had mounted a vicious young brute that was at that moment bucking furiously. As it was, before either rider could utter a cry, the horses met.

Jake was thrown clean and far; and as ground and sky whirled before him, the last thing he saw was the young horse reared, as it seemed, into the dark-blue vault overhead—trembling in the balance—falling backward.

Jake was only half-stunned by the fall, but he was more than half-sobered. In an instant he had picked himself up. The colt was just rising to its legs, apparently no worse; his own mare was cantering awkwardly away, with her near foreleg thrust through the reins; and on the ground, close to the stockyard rail, lay a heap of gray flannel and white moleskin and quivering flesh. At sight of this, alcohol seemed to reassert its sway in Jake's brain; it reeled; and he was hardly more conscious of what followed than of what took place around him while he was lying helpless and insensate at John Byrne's.

Twenty minutes later, the rushing air on his temples brought him once more to his sober senses. He was on the mare, and was riding swiftly back to the hut. Then, for the second time that day, Long Jake tried to piece together what had happened. But now all came back to him consecutively and with fearful vividness: How he had crept timidly up to the thing that lay so still, touched it, and started back; lifted an arm, and let it drop heavily. How he had taken the warm yet lifeless body in his arms, and, exerting all his strength, staggered with it round to the veranda, where a shrieking, laughing maniac had rushed out upon him. How, in spite of the madwoman, he had borne in his burden and laid it down as gently as might be. How, very soon, a noisy rabble rushed up; how he answered their questions as clearly as he could, and promised to return to the township if wanted; and was then suffered to break away. All as in a dream.

But that night, when safely back at his shepherd's hut, away on the sloping pasture-land beyond Razorback, when darkness fell over all things, and the white dead gum-trees towered like risen spectres on the side of the range—that night, Long Jake lay tossing on his bunk and making sure that this time, at last, delirium tremens had fairly caught him. For the moon, shooting her cold rays through the open door of the hut, cast a ghostly white shadow on the sandy floor—a gleaming ghostly shadow, sliced as with a knife out of the surrounding blackness, and taking the hideous shape of a coffin; and outside, the young saplings were nodding their heads like funeral plumes; and the crickets croaking a hoarse, monotonous, maddening dirge. Then anon the dead face of the man was thrust before his disordered vision; and anon the frantic face of the woman. So that at last he could bear it no longer, but tore himself from the bunk, and roamed through the night, half-dressed as he was, among the pale corpses of trees, until the morning dew upon his uncovered head, and the morning breeze upon his fevered temples, helped to cool and clear the poor bewildered brain.

Long Jake was in the habit of planning these systematic carousals of his with a deliberation that was little short of horrible. This time he had waited patiently until heavy rain filled the creeks and water-holes, so that his flocks had the best of feed and water close at hand; and

he had trimmed and mended the rude fences of the great paddocks, and left everything generally snug. Then he had obtained from his employer a substantial cheque, on the pretext of buying a horse at Wattle-town. For the projected 'bust' was by no means Jake's first since his installation in the hut on Razorback, and he was well aware that if he were found out—let alone the harm that might or might not befall the sheep during his absence—it would be at least as much as his place was worth: that was thirty shillings a week, plus rations, and in itself was of small consideration; he could get as much, perhaps more, from any squatter in the colony, as an experienced shepherd and boundary-man. But somehow, Jake had got to like the place for its own sake. He was content in his solitary life among the grim and sombre ranges. Indeed, this queer, reserved, nameless old fellow found the solitude of Razorback the best thing in life. I am not sure that he did not regard those 'busts' at King-parrot Flat simply as so many necessary life-tonics which he owed it to himself to administer with unfailing regularity. At anyrate the rude slab hut, the cats, the cockatoo, the very prints pasted on the walls—these simple signs grew by degrees to spell for Long Jake the word—'Home.' And until this time he had experienced nothing but thankfulness and relief on returning home, sick and wearied from his excesses.

But this time it was different. Home conveyed no comfort; he could not rest. He felt that which—out of a pretty lengthy experience of similar after-glows—he had never felt before—namely, shame. That was not the worst of it, however. The dead storekeeper was always before his eyes. And when riding through the bush, he found himself unconsciously looking over his shoulder, fearfully expectant of the wild face and uplifted arm of the woman whom he had been instrumental in making a widow. For brooding exaggerated the circumstances of the accident, until the brand of the primal murderer would burn on the brow of Long Jake in the dead of night and send the poor self-accuser wandering pitifully over the ranges.

Rough as the life was in the old days—the other time-honoured epithet is for the optimists—there were still coroners to be had for the sending, even in the ranges. And a couple of days after the accident, a messenger summoned Long Jake to the inquest at the dead man's store. Well, no blame was laid on poor Jake, except by himself; and he galloped back without speaking to a soul outside the store. The widow could not be brought to attend the inquiry, and she was not seen.

A part of the weight that pressed it down was now lifted from the mind of Long Jake, but only a slight part. In the distorted perspective of his own mind he was still blood-guilty; and could there be degrees in blood-guiltiness? He would have ridden into the home-station and laid bare his naked feelings to the boss, who was a kind and just man, and who, moreover, would certainly hear of the accident from other—possibly unkind—lips. But, unfortunately, the one rigid rule of Long Jake's life was, never to lay bare a fraction of his feelings to a fellow-man. However, after a few days, a journey to

the homestead, for rations, became imperative. It was high noon when, amid a loud barking of dogs, Jake led his mare into the rough stable and walked over to the store. Within, the young gentleman from England—who was obliging enough to acquire 'colonial experience' at a nominal salary—was whistling shrilly.

'Ha! it's you, Long Jake,' he cried as Jake entered. 'Rations? All right; in a minute; but—hang it!—shake a paw first, do.' He was evidently in tremendous spirits; and Jake was too perfectly colonised to be in sympathy with any such demonstration. He held out his hand sulkily; he intended to have his rations at once, and go. But the high-spirited young gentleman went on whistling noisily and packing emu eggs in sawdust, as if no one was at the other side of the counter waiting to be served.

'Tell you what's up,' he presently volunteered, pausing in his song; 'I'm off home! Sick o' this, don't you know—rough as blazes, and all that kind of thing. Yes, home to England! Jolly, eh?' A vivacious continuation of the interrupted tune, in another key, and then: 'Sail next Tuesday week; Blackwall liner; good business, eh?' Crescendo: the whole store filled with the volume of this young Briton's whistle.

'If it's a fair question,' asked Jake, when the tune had come to a blatant end on a wrong note, 'what might a passage cost?'

'Just the sort of question it is—ha, ha!—you don't see it, though!' laughed the other airily. 'Why, about seventy pounds, first-class.'

'Ah, but second?'

'Oh, about thirty, I should say.—Why? Are you thinking of going home too?'

Jake said curtly that he wasn't; and asked plainly if he might expect to be served that morning.

While the young man was busy with the scales, William Noble—the boss—came into the store and conversed pleasantly with his boundary-man without one allusion to King-parrot Flat. And before he left the homestead, Long Jake ascertained that he had still five pounds seventeen and eightpence standing to his credit in the station books.

'Thirty pounds!' he muttered strangely as he remounted the mare. He had 'lammed down' that sum at John Byrne's the week before! He rode home to the hut in silent thought; but when he dismounted at the well-known spot, he once more whispered, 'Thirty pounds!' This time the words fell naturally from his lips; they had formed the keynote of his reflections during the ten-mile ride.

THE CAUSE OF DROUGHTS.

In a clever little brochure lately given to the world by Mr Velschow of Copenhagen, the author, in treating of *The Natural Law of Relation between Rainfall and Vegetable Life*, aims high, for, in his short concise treatise, he endeavours 'to set forth a theory of the formation of deserts, notably those in Australia, and to give an explanation of the real cause of deserts and droughts; thereby indicating how far it may become possible to work against, and in many instances eventually overcome, the evil of drought.' If his theory and

remedy are correct, South Africa, which is a land of droughts as well as Australia, ought to profit by Mr Velschow's observations.

But he is not by any means the first writer who has propounded the 'general principle' 'that absence of vegetable life is the real cause of absence of rain,' though he seems to think that in so saying he will 'hardly find many followers.' Indeed, one might almost say the idea is as old as the hills. One very ancient writer, Critias (about 600 B.C.), speaks of the 'sickness of a country in consequence of deforestation;' and more than three hundred years ago, Fernando Colon declared that 'the rains in Madeira and the Canaries had become rarer since the trees had been cut down.' Humboldt and many others have given forth their notes of warning—alas! too often unheeded—with the consequence that, on account of the destruction of timber, vast countries are subject to drought.

This has not always been the work of the European settler only. In Southern Africa, we know that the natives have a regular season for setting fire to the long rank grass which grows in Kaffraria and in different parts of the various colonies and states, thereby frequently injuring large tracts of forest-land; and this custom was kept up by the early Dutch Boers; also that of chopping down all the mimosas, the thorny branches of which they use to make their sheep and cattle kraals. Dr J. Crombie Brown, when government botanist at the Cape of Good Hope, studied the subject deeply, and in his work upon the *Hydrology of South Africa*, says, speaking of bush-fires: 'In this way does the destruction of forests by fire tend to promote the desiccation of a country so far by combustion, and further by exposure of the humus to decomposition by the sun's rays destroying one of the constituents of the soil which exercises great retentive power on its moisture.' And again, in his book on *Forests and Moisture, or Effects of Forests on Humidity of Climate*, he says: 'There are cases in which an extensive destruction of forest has been followed by a marked desiccation of soil and aridity of climate, and some cases in which the replanting of trees has been followed by a more or less complete restoration of humidity; or the planting of trees where there were none has been followed by a degree of humidity greatly in excess of what had previously been observed.'

But South African writers upon this subject are too many to be enumerated. In a little book, written several years ago, *The Farm in the Karoo*, the chapter upon Karoo Deserts takes up the subject, also quoting a paper that Mr C. Brown had read before the British Association at Clifton. Mr Velschow's chapters on what he calls the 'air-cushion' are very interesting, and give a reason for that most distressing phenomenon we so often used to observe in Southern Africa in times of drought, namely, the coming up of clouds evidently well charged with moisture, and their gradual dispersion without apparently bursting or leaving a single drop of rain.

We have lived in the Karoo during a severe drought, when not only every blade of grass had long disappeared, and every leaf and twig of the Karoo bushes had followed, but the very stems and stalks of the plants were baked by

the hungry, starving sheep and goats; and well do we remember our all rushing out of the house in answer to the cry, 'There is a small cloud coming up from the sea.' How we watched that cloud! It came on steadily till it was nearly over our heads. Surely it would descend in a copious shower, for its aerial voyage was at an end, and it seemed stationary. Alas, although the cloud did not move on farther, all the same it was soon gone, and not a drop of rain had fallen on any portion of that thirsty land. It only rained *in* the clouds, and went towards helping to saturate what Mr Velschow calls the 'air-cushion.' He says: 'The sky over the inner plains of Australia is generally for weeks covered with clouds before rain ultimately sets in after a drought; and during this time, the clouds are constantly engaged in discharging moisture, until the air-cushion at last becomes saturated. Then the clouds no longer discharge moisture into the air, but on the earth's surface itself.' Thus showing that if the clear transparent air just above the earth were moistened by the evaporation from vegetation or forest-trees, the rain-clouds would pass through the air-cushion by amalgamating with the moisture already therein.

This is the reason of our having such great floods of rain after a drought in South Africa, when rivers are frequently rendered impassable for several days at a time. The water is there, although we do not see it; and when at last the air-cushion is broken into by some powerful electric disturbance, it falls to the earth in torrents so abundant that rivers rise to a height of forty and even seventy feet above their usual level; the greater part of the water rushing away at once to the sea, a comparatively small quantity being saved by dams and reservoirs.

The application of the theory in a practical form is, that when the land becomes cultivated and clothed with cornfields, vineyards, hop-grounds, and orchards, as well as having the forest-lands continually renewed, the rain-clouds, attracted by the evaporation which will inevitably ascend from all such growth, will be constantly distilling as rains the moisture taken up from the ocean, thus preventing the great air-cushion from ever becoming so dry and waterless that in satisfying its own great thirst, the dire disaster of drought is felt all through the land.

PRINTING INK FROM SPENT COTTON WASTE.

The utilisation of waste products, which has made such great progress during the last two decades, has experienced a further development in a department in which we are more especially interested. We refer to the process of Mr C. T. Bastand, of 38 Riley Street, Bermondsey, London, by means of which spent cotton waste is made to yield up all the oil and greasy matter contained in it, the latter being subsequently converted into that useful agent of civilisation, printer's ink. Cotton waste, as our readers are aware, is used *into* clean machinery of all descriptions. When spent—that is to say, used up—it is full of refuse oil and grease. Hitherto, it has been the practice to boil the spent cotton waste in a solution of caustic soda, by which process all the grease is extracted, to wash it, and mix it with

new waste, when it is again placed upon the market. The oils and grease are allowed to run to waste.

Mr Bastand proceeds in a very different and at the same time highly remunerative manner. He places the spent cotton waste in a closed cylinder heated by steam by means of an interior coil. He then pumps a solution of bisulphate of carbon into the cylinder containing the waste, upon which the chemical acts, separating the oil and grease. In their combined state, the bisulphate solution and oil are then run by him into another steam-heated cylinder. Here the bisulphate becomes vaporised, and passes thence to condensers, and is finally run into a stone tank, to be used over and over again, the loss of bisulphate being almost imperceptible. The cotton waste freed from oil is washed, dried, and sold again.

The far more valuable product obtained, the oil, is run from the second cylinder into tanks, pumped thence into a copper heated by a small portable furnace, running on wheels, and freed from all moisture. It is then pumped into a second copper, where it is converted into the varnish from which printing ink is made. When the varnish has been brought down to its proper consistency, the furnace is withdrawn, and the varnish is taken to the mixing-house, where it is incorporated with the necessary pigments and other ingredients necessary to produce the various shades and qualities of printing ink. When mixed, the crude ink is ground in a French buhr-stone mill, and, after grinding, delivered into a machine, in which it is passed between rollers a number of times, according to the quality of ink required. To obtain the lampblack used in the manufacture of printing ink, a portion of the recovered oil is used; and thus what was formerly wasted is converted into the medium which enters so largely into the diffusion of knowledge.

BURIED TREASURES.

'Tis true my later years are blest
With all that riches can bestow,
But there is wealth, wealth cannot buy,
Hid in the mines of 'Long Ago.'

There jealous guard does Memory keep;
Yet sometimes, when I dream alone,
She comes and takes my hand in hers,
And shows me what was once my own.

I revel 'mong such precious things;
I count my treasures o'er and o'er;
I learn the worth of some, whose worth,
Ah me! I never knew before.

And then all slowly fades away,
And I return to things *you* know,
With empty hands and tear-filled eyes,
Back from the mines of 'Long Ago.'

THAT STITCH IN TIME.

BY MRS LYNN LINTON.

THAT proverbial stitch in time is said to save nine. It might be said to save ninety and nine, and yet leave a few hundreds as a reserve in hand. Time and Opportunity have thick forelocks in front, and never so much as a solitary gray hair at their bare polls by which to seize them and compel them to halt when once they have passed; so, moments must be caught as they fly, and things, if they are to be done effectually, must be done promptly. 'Never put off till to-morrow what ought to be done to-day,' is a better rule of action than the Spaniard's lazy *mañana*, or Lord Palmerston's half-laughing, half-cynical dictum about the self-answering property of letters if left long enough unnoticed. Those who understand the true science of life take their Time emphatically by the forelock and leave nothing to mend itself. With them rents are sewn up, thin places strengthened, weak attachments tightened, missing bits supplied, all as soon as needed. Thus, preventable disaster never wrecks their lives, while premature decay of valuable material is unknown, and all things last to their natural term. But this can be done only by taking the fault at the beginning. The boy's finger stopped the little hole in the dike which an hour's neglect would have widened into a disastrous breach. The insignificant rent which a few delicate stitches would have brought together and made invisible, left to increase by time and friction, becomes absolute destruction of all usefulness or beauty; and the old nursery apologue of now, for want of a timely nail, the shoe, the horse, and the rider were successively lost, is exemplified in practice every day of every year.

If all life-lore could be concentrated into one axiom, that of the stitch in time would be the wise man's device. It spreads itself everywhere. Like the protoplasmic monad, it envelops every circumstance, and converts to its own law every

fact and every feeling. That stitch in time applies to emotions as well as to things—to persons as well as to events. It includes for one the misunderstandings which, be as careful as one may, will arise between friends. That 'something light as air,' that gossamer thread of suspicion, of displeasure, of mis-reading, detaches itself from the solid garment of affection, and incontinently the stout well-knitted fabric begins to unravel. The floating end is of the finest description, and a few stitches would fasten it back into its place and prevent all the after-results. But those stitches are neglected, and for want of them the entire fabric slowly and surely unravels into ruin. Of the former closely woven garment of friendship not a vestige remains; only a heap of unsightly thrums and ends, which bring as much annoyance as the former had brought pleasure. A frank demand for a frank explanation would have cleared away the misunderstanding, and would have been the stitch in time to save not only nine but the whole concern. That something light as air was a mere cobweb—a fancy—a suspicion—an idea—no more solid than the cloud which looks from a distance to be a solid entity, and when near at hand is found to be as unsubstantial as a dream. It could have been brushed away with a feather. The dropped stitch might have been fastened back with a hair: but the first beginnings were neglected; and that hole in the well-built dike through which the waters began to ooze, so gently, so slowly, that a boy's finger could stop them, became a breach which swept away farms and homesteads, brave men and noble women, cattle and little children, and left the whole face of the country scarred and desolate.

Quarrels follow the same law. That stitch in time, the 'soft answer which turneth away wrath,' has been neglected, and in its place rent added to rent, thrust for thrust and goad for spur, bring the inevitable result of total disruption, unmendable disintegration. Two irascible people make but short work of peace and amity. When they come together in the bonds of matrimony

they come only to part when the cat-and-dog life they lead has become insupportable. Had one of the two just so much respect for this old adage of ours as to forbear to snarl when the other growls—to stitch back the hanging hook, the loosened tape, before weakness of attachment becomes total severance—the thing would have worn into its fitting groove like many another angular marriage. But there was none of this wisdom; so, quarrels begat quarrels, and weakness became dissolution, and what a little forbearance and patience and foresight might have made a success, fell to pieces as a failure; and two people were left bruised and maimed and stranded on the shore of desolation, all for want of that stitch in time—that soft answer which turneth away wrath.

With habits of extravagance leading to debt, disaster, ruin, and perhaps dishonour, that stitch in time is of primal importance. It is needful to begin at the beginning of things if any good is to be done—to fasten back at the first unravelling, if the fabric of a man's fortune is to be preserved. It is of no use to let rents go on till almost all the original stuff has been torn away, till the gold has melted into vapour under the blowpipe of bills and IOUs. No readjusting can make an exiguous garment as comfortable a fit as it was when there was plenty of space everywhere. The material has been destroyed, and failing the fresh supply got by a lucky speculation, no more is at hand. A man's coat must be cut according to the amount of cloth wherewith he is supplied; and when he has only enough for a jacket he cannot make an ulster. If heed had been taken of the first rent and the initial hole had been stitched up, all would have been well. As things are, no power on earth can replace that which has been thrown away, and no alchemy of retrenchment can restore that which has been wilfully consumed. All future expenditure must be based on the narrowest line consistent with stability; and the pleasures which were once had daily by the bushel are now scarce at the half-pint. All for want of that stitch in time which ought to have sewn up the first unravelling and prevented the rent from growing larger!

What is true of habits of extravagance is true also of all habits of every kind. Human nature is at once plastic and rigid. It runs easily into a mould, but it sets as easily as it runs. That extra glass, taken once or twice for the nameless 'sinking' which impatience will not bear and for which imprudence demands a 'pick-me-up,' soon becomes a habit which has to be perpetually renewed and as perpetually increased. The little stitch in time, that small effort of self-restraint which would have been so easy in the beginning before the habit had rooted, becomes by time impossible, and the minute hole in the dike increases till it becomes a breach through which rush the strong waters of hopeless and irremediable drunkenness. The habit, so easy to have been checked in the beginning, becomes the overmastering and overwhelming controller of destiny; and destruction and disgrace follow on the failure to put in that stitch in time which would have saved all. So with gambling, so with indolence, so with evil-speaking, so with meanness, and on to the end of the cata-

logue. If cockatrices are to be destroyed, you must begin with the egg. If you let them hatch out and live till they are full grown, the chances are they will devour you instead. And is not this eminently true of health, as well as of habits which have a more moral side to them? That neglected cold, my friend, nearly cost you your life. You neglected the warning of that 'oppression on your chest,' of that cough which shook you to pieces, and thought that a brave heart and stout will could subdue inflammation without much ado. When you were lying between life and death, for twenty-four hours on the brink of the Eternal River, you learnt the value of that stitch in time which would have saved you more than the proverbial nine. Had you nursed your cold when only a cold, it would not have developed into double pneumonia. Had you crushed your cockatrice in the egg, those blood-stained blows of his would not have struck so near your heart. How much those little stitches, not taken up in the beginning, have to answer for when they are called neglected colds! Half the diseases on the list come from them. Also from those symptoms of overstrain, neglected and disregarded, do we plunge into sad issues. That dear valuable friend and mother, now lying at the point of death, would be still hale and hearty had she laid up when those first uncomfortable sensations pointed to the storm signals of her health. She did not heed them—thought she would work her way through the breakers and wear down the threatened dangers; and only when dropsy supervened and her poor feet would no longer bear her weight, only then did she consent to keep the bed wherein a timely lodgment would have saved all the rents that came. It would have been the stitch in time, and the rent would have been replaced with a patch as good as new.

So we go on, and the roll-call is as long as there are circumstances in human history. We stop the first evil reports, or of ourselves or of our friends, and the slander dies, like a upas tree cut at the root. To let it go on would have been to let it spread and propagate, till half a hundred scellings, half a hundred variants, all differing from each other and all false, had filled the ground and obscured the light of day. Who knows now how many of the slanderous tales sent home by unfriendly ambassadors in the days when no newspapers checked rumours and sifted reports, were true or false? The repute of those dead personages has been marred for all time by this word and that, set in the midst of confidential letters sent by trusty envoys sworn to fidelity and secrecy. From that word came all the rest. It was the first unravelling, and there was no friendly hand to stitch up the rent. Who knows? Faustina, Lucrezia Borgia, Catharine de' Medici—to mention the most salient three of history—perhaps they were the victims of slander, and their fair fame has been the unravelled fabric which the stitch in time did not save. It may well be so. Closer at hand and in these present days of fuller publicity, we have reports now of this prominent personage and now of that, which adherents deny and opponents repeat. Vague slanders float in the air. Kleptomania, drunkenness, madness, immorality—the little rent begins by some

imprudent gossip who has mistranslated, or more simply imagined, and the thing spreads. The 'Jacob's ladder' which defaces a shining garment spreads till it has ruined all, because the stitch in time of vigorous denial has been wanting. 'Small habits well pursued betimes, may reach the dignity of crimes,' says Mrs Hannah More. A match maliciously struck may burn down a palace. A masked torpedo boat, set afloat out of sight, may wreck the noblest ship that ever outrode a tempest and won a fight; and so a few words of poisonous import may destroy a character past all future rehabilitation—unless, indeed, we take heed of the beginnings, remember the old adage about the stitch in time, and put our heel on the cockatrice egg before it has hatched itself out and become the parent of a countless brood.

JOHN VALE'S GUARDIAN.

CHAPTER XXVII.

As a matter of course, the farmer's crónicas came to know that his portrait was being painted; and when at the end of the second sitting the head was put in, in a very firm and resolute fashion, quite a little stream of them dribbled in at odd hours to look at it. There were all sorts of doubts and surmises as to what was to happen to the unfinished parts of the picture, but about the live portion of it there already there was no doubt whatever. The actual Shorthouse seemed to look out of the canvas, ruddy and tanned and lined, honest, prejudiced, thickheaded, and kindly, a type of the old-fashioned rustic midland man, hardly to be excelled in value. The farmer knew nothing about schools of art; but he had gone to a passionate realist, and ignorant as he was, he could hardly fail to see some of the differences between the pale, timid, and stupid conventionalities of his wife's portrait and the masterly veracity of his own. The idea that Jousserau was, as his daughter had suggested, possibly a gentleman, had taken possession of him, and he called him 'young man' no longer. Where and when he had learned as much as that, he would have been puzzled to tell; but he was somehow aware that a Frenchman claimed the right to be addressed as 'mossoo,' and that title he bestowed on Jousserau, to the painter's great amusement and enjoyment.

When the antique silver flagon with its rim of foaming beer, the blue coat and the red waistcoat, the Broseley pipe, and the tumbler were all set upon the canvas, the farmer's self-congratulation was almost without bounds. Day by day, as Jousserau finished his morning's work, he put the canvas away in the best parlour, turning its face to the wall, and exacting a promise that no dusting should be done while it remained there. Half-a-dozen times in the course of the day the farmer would turn the work round, handling it as tenderly as if it had been a new-born child; and sometimes he would spend a whole half-hour in the contemplation of the work. The tankard looked as if one could actually lift it; the pipe was fragile and slender as it was in nature; the glass of beer, with its encircling ring of dying foam, looked drinkable. The red plush waistcoat was like plush, the blue coat like blue cloth, the brass buttons like brass buttons. The picture bade

fair to be a source of perennial enjoyment to him, and he thought that he had never laid out ten pounds to such advantage in his life.

The morning hours spent in the farmer's kitchen—for there, for the sake of the light, Jousserau insisted on pitching his easel—were not without their sentimental effect upon the artist. Monsieur Jousserau's experiences in affairs of the heart were varied, and his aspect toward the sex was variable and inconsistent. He was either over head and ears in love with some one of its charming members, and ready for her sweet sake to forgive all her sisters the faults he charged against them; or he was for the moment a confirmed misogynist, armed with epigrams by a hundred of his fellow-countrymen. His action in courtship was rapid and decided, and three or four interviews with any lady who took his fancy served generally to bring him to the point of declaration. No one of the dozen or two to whom he had proposed under these conditions had as yet found this brusque and lively method of wooing satisfactory, and the good little man had indeed been unfortunate in the fact that a fair half of the ladies of his choice had been already bespoken. Finding his offer set aside, he returned to his misogyny, and contemned all women for at least a fortnight.

Perhaps he was learning something from experience, or perhaps he was inwardly aware of something more serious in his conditions than he had hitherto observed. Be these things as they may, he made no matrimonial overtures to Cecilia, and it is possible that, like the immortal parrot of the story, he refrained from speaking because he thought the more. His one overt act was to hint to the farmer that it would be a pleasant thing to have a portrait of Mees Cecilia. Shorthouse took kindly to the notion, and the painter presented himself with a new canvas before the girl herself had been made aware of the project. She resisted it at first, but feebly, and gave her first sitting to a running accompaniment of blushes, which to Jousserau's mind became her especially well. The young lady gave her *séance* later in the day than her father had done, and the farmer absented himself from his affairs to play propriety. He would stand pipe in mouth behind the painter, watching him with untiring interest, and became more absorbed in the picture's progress than he had been even when he had been himself the subject. He had never known how pretty Cecilia was, and probably never would have known if nobody had come to show him; but she made a lovely picture, and there she was in actual flesh and blood evidence to justify the painter's reading of her. Jousserau had caught her with a certain half-pensive smile, which Farmer Shorthouse would never have had the eye to notice.

'It's thee to the life, Cecilia,' he would say a dozen times a day. 'I've seen thee lookin' like that hundreds an' hundreds o' times.—It's the very spit on her. It ain't like a picture; it's like another gell a-sittin' there, the very livin' image on her.'

The farmer paid, and Jousserau received with perfect gravity his twenty pounds for the two pictures, as if that sum had really represented the value of his work. But when the work was done and the visits to the house were all over, he became unutterably mournful and *distract*,

wandering about the yellowing lanes in solitude, and composing in his own language sonnets to his mistress' eyebrow.

The cronies who had come to see the farmer's counterfeit presentment came also to see Cecilia's. They were all critically admiring; but for the most part the merits of the Broseley pipe, the silver tankard, the red plush waistcoat, and the glass of beer pleased them better than the delicate beauty of the second work. The farmer was uncertain in his own opinion, and wanted a sound criticism to go upon. So one morning when the two works were freshly framed, and he stood in the best parlour surveying them and debating their respective merits in his mind, the voice of the vicar came like an inspiration to him.

Now, Parson Heathcote was a personage in those parts, being no less than first-cousin to my Lady Barfield. He was a man of wealth and taste, and everybody knew that the parsonage boasted a fine collection of pictures. The farmer hailed his arrival, therefore, and at once inducted him into the parlour to give judgment on Jousserau's handiwork. The polished cleric put up his eyeglasses with a fine want of interest, but had no sooner looked at the canvases than he changed his manner. 'Why, Shorthouse, Shorthouse! what are these? Where did you find the man who did these?'

'He's a Frenchman from foreign parts,' Shorthouse answered. 'I found him a-drawing and colouring the cows in one of my fields.'

'A wandering artist,' said the vicar. 'Come, this is interesting. What does he make you pay for these?'

'Ten pounds apiece,' said Shorthouse.—'I don't think it's out of the way, sir.'

'Rather curiously out of the way, to my mind.—Do you know, my friend Shorthouse, that you might pay five hundred and get no better work?—What's the man's name?'

'I've got it wrote out here somewhere,' said Shorthouse. 'I don't seem to sound it like he does. I can't get my tongue round it. It's wrote out on a piece of pasteboard,' he continued, groping in his waistcoat pockets.—'Ay, here it is.'

'Jousserau!' cried the vicar, 'Achille Jousserau!—What brings him over here? Why, he's the designer of the great memorial window for Lord Barfield, which is to be unveiled for next Sunday.—Let me tell you, Shorthouse, that he must be particularly fond of you to paint your portrait for ten pounds. He wouldn't paint mine for ten times that.'

The farmer began to think more than ever of the pictures after this decisive verdict.

'Father would hardly believe,' said Cecilia, who had followed to look and listen, 'that Mr Jousserau was a gentleman.'

'A gentleman?' said the vicar. 'Of course he's a gentleman. A man of very good family, and many accomplishments. A very charming little fellow, and a great friend of mine.'

The farmer felt horribly abashed that he should have called a friend of the vicar's, 'young man,' and that he should have patronised him.

'Dear me!' he said. 'To think as he should be a friend of yours! Why, there's Zaiah Winter, as has known him for over a twelve-month, gives out as he lived in Warwick with a workin' foreigner there, quite poor and lowly.'

'Ah, yes, my friend,' said the parson; 'but the man he lived with was his fellow-townsmen. That is a great tie between Frenchmen who are living out of their own country.'

'The young gentleman dresses nohow,' said Shorthouse.

'Like an artist—like an artist,' said the parson. 'A bit of a bohemian, but a charming and good little fellow.—You're in luck, Shorthouse.'

'Excuse me, sir,' said the farmer. 'Theer's no offence meant, and I hope as none will be took.'

'I hope not.—What is it?'

'These here foreigners, I'm told,' said Shorthouse with great gravity, 'is papists, all and sundry. I shouldn't ha' thought as a papist would be let paint a window for a Christian church.'

'Well, that's a point, to be sure,' the vicar answered, laughing; 'but it happens that Mr Jousserau is not a papist. He's a Huguenot, Shorthouse, and as good a Protestant as you or I.—You'll see him in church next Sunday, I daresay.'

Here were more ideas. The world was growing embarrassing.

But the most amazing befuddlement awaited him on the Sunday. It was a soft gray morning after rain. The church bells were ringing, and from any little bit of rising ground the country-folk might be seen straggling towards the church in answer to their invitation in rather more than their usual numbers. In the old days, the Earl of Barfield had sat through the morning service of half the year round in the family pew; but since the late Earl's decease and burial, the Quality had left that part of the county, and their presence at church was a rarity. They were to be there that morning in honour of the inauguration of the great memorial window. The young Earl of Barfield was expected with the Countess, and Sir Ferdinand de Blacquire, the county member, with her ladyship his wife, who was as yet known to none of the good people of Beacon-Hargate.

Cecilia had started on ahead with the daughters of a neighbouring farmer, and Shorthouse was solemnly waddling along alone, when he found himself accosted by Snelling. They had seen but little of each other since the latter had taken his answer from Cecilia, and Shorthouse at first was a little embarrassed by his friend's greeting.

'I want a word with you,' said Snelling; 'and if you'll take what I'm going to say kindly, I shall be obliged to you. I've heard as that young Frenchman has been a good deal at your house lately.'

'Yes,' said Shorthouse, who was aware of the feud between Jousserau and his companion. 'He's been paintin' my portrait, and Cecilia's.'

'Faithful are the wounds of a friend,' quoted Mr Snelling; 'but the kisses of an enemy are deceitful. If Providence had blessed me with a daughter, Shorthouse, that's not the sort o' young man that I should allow to come anigh her.'

'No?' demanded Shorthouse.

'No,' said Snelling.

'And if not, why not?'

'Well, I'll deal square with you,' Snelling answered. 'The man's been taking away my character, and anything I say agen him might carry less weight than it would if I was supposed to have a likin' for him. But that won't hinder

me from tellin' what I know to be the plain truth about him: he's a low scoundrel, and has no right to cross a decent man's doorstep.'

'You're mistook in the young man,' said Short-house. 'Parson Heathcote claims him as a friend, and speaks most high of him.'

'I took you for a man o' sense, Shorthouse,' said Snelling. 'The idea o' you believin' a cock-and-bull tale like that!'

'Cock-and-bull, or no cock-and-bull,' Short-house returned, 'it was the vicar himself as told me so. I reckon he knows whether a man's a friend of his or whether he isn't. He said he was. Parson says he's a gentleman. You've quarrelled with the man, and you're willing to lend your ear to anything.'

This staggered the vulgar traducer for the moment, and he saw that if Jousserau really had powerful friends, it might be wise on his own part to leave him alone. But a rather singular and altogether unlooked-for thing had happened to Snelling since he had taken his dismissal from Cecilia. He had proposed to marry the young lady's prospective acres rather than herself, and had looked upon her final acceptance of his suit as being almost certain. Except as an unusually prosperous stroke of business, he had hardly cared to think about it. But from the moment at which he had heard her answer, he had been growing more and more into a desire of her. It began first in a dull anger and resentment, in which he wished for nothing but the power to rule her, and bend her or, if need be, break her to his will. It was a natural part of the man's egotism to feel that a woman put the worst of possible insults upon him in refusing to marry him. He had not the faintest wish in the world to understand himself, or to trace to their source his own emotional processes. But if he had had the will and the power to do that, he would have seen resentment turn to hatred, and hatred in its turn change into some distorted semblance of love. So long as he had had but little doubt that she would take him, he had not cared for her; but now he saw how impossible she was for him, he began to hunger for her. And since any kind of real passion is more piercing and discerning, because more alert, interested, and observant than average feeling, his inert and sluggish mind woke suddenly to a new perceptive faculty. He was far and away too stupid and self-satisfied to trust to instinct; but instinct somehow told him that Jousserau was or would be his rival, and his own nature taught him to stab the rival before he had a chance to strike. It made matters none the easier for him to know that Cecilia would in all probability be a score of times wealthier than he had supposed her to be when he had still thought her property worthy of being joined to his own. The prize had turned out to be infinitely more valuable than he had fancied, and he had missed it. In spite of the girl's disclaimer, he believed that Jousserau had poisoned her mind against him, and he was not the man to submit to an injury without retort.

The churchyard was full from the lichgate to the porch, for nobody dreamt of entering until the great people should have arrived. The bells changed their measure, and then stopped, all but one, which tinkled rapidly, as if to hurry

up the delayed magnates. The carriage drove up at the last second, and from it alighted, amid a respectful and curious silence, the Earl of Burfield, who assisted the Countess to descend. Then came Sir Ferdinand, the county member; and all necks were craned for a first look at his bride, when, to the wonder of everybody who knew him, M. Jousserau descended from the carriage, glorious in lavender gloves, a silk hat, and a frock-coat, carrying those splendours with no embarrassment or look of rarity, and being in nowise moved either by the curiosity he excited or by the exalted company in which he found himself.

Snelling could scarcely believe the evidence of his eyes, and Shorthouse fairly gaped in his astonishment. As for Cecilia, who was a most honest and simple-hearted creature, she felt these great folks to be so far above her that to have been on terms of week-long intimacy with anybody who went familiarly about with them exalted her with wonder. The painter wore a kind of halo to her fancy. He raised his hat to her as he went by, talking to Sir Ferdinand in his own tongue. A moment earlier, he had worn the bright and pleasing smile she had seen so often; and on a sudden, as he saw her, there was a touch of sadness, humility, apology in his manner—she knew not what. She had no time to think of it, and in the midst of her astonishment, she had not even the wit to think of it; but there was something in his salute, and something in the look accompanying it, which seemed to say that though he was at obvious ease with these great people, he was less at ease before her. The girl's heart began to beat, and—she could not have told why for the world—but Jousserau, if he had only known it, had grown in that passing moment to be a personage in her eyes; and from that instant forward she never thought of him without the latent understanding that he was cleverer, handsomer, and more distinguished than the common run of men. Only that; and yet, if he had known it, that was something.

(To be continued.)

AN OLD SCOTCH BURGH.

JUST where the estuary of the Forth begins to widen, nestling beneath a stretch of wooded hill, lies the ancient royal burgh of Culross. A couple of centuries ago it was a scene of activity and life, when its 'girdle-makers' were a powerful craft, and its wares were famous throughout 'the north countrie'; but to-day, the grass grows green within its streets, and the clang of the hammer is an unknown sound. Culross has preserved its age in a way that few places can equal in those latter days, for the nearest railway is three miles off, and the bay is shallow even at high-tide. A more perfect retreat for the nineteenth-century lotus-eater could scarcely be imagined. Facing the water is the Town-house, with its quaint Dutch-looking spire; farther up, above the red-tiled roofs of the houses, appear belts of garden; and higher still, flanking the narrow walks, stand the gray terrace-walls, almost covered with branching fruit-trees. So, by various crooked 'wynds' and

narrow ways, the old town creeps up the hill, and at length lays the warm mellow colour of its ancient walls against the cool green of the trees that conceal all but the tower of the Abbey Church.

The Abbey of Culross was founded by Malcolm, Earl of Fife, about the year 1216, and though little now remains of the original structure, there are still proofs sufficient to show that it must have been of considerable extent. What was formerly the choir is now used as the parish church, and is entered through two very fine Norman doorways at the foot of the tower. In the manse garden close by is a large and well-preserved vaulted passage with groined roof and graceful arches. Behind this is a chamber somewhat similar; and farther back still, a flight of stairs, reached through another Norman doorway, leads to the roof. The monastery orchard has had an admirable southern exposure, sloping gently down to the shores of the Firth. Part of it is now comprised in the policies of Culross Abbey, a mansion-house to the east of the church, begun by Lord Bruce of Kinloss, and said to be designed by Inigo Jones.

Close to the Abbey Church is the family vault of the Bruces, where lies the heart of Lord Edward Bruce, who was killed in a duel with Lord Sackville, afterwards Earl of Dorset. The quarrel seems to have been about some lady, and the issue of the affair is fully detailed by Steele in several numbers of the *Guardian*. The meeting took place at Bergen-op-Zoom, in Holland; and 'there,' says Lord Sackville's account, 'in a meadow, ankle-deep in water at the least, bidding farewell to our doublets, in our shirts we began to charge each other.' Lord Bruce at first gained the advantage; but being much excited, he failed to parry a thrust of his adversary's sword, and fell, exclaiming: 'Oh, I am slain!' His body was buried at Bergen; but tradition affirmed that his heart, preserved in a silver case, had been carried to Scotland, and deposited in Culross Abbey Church.

In 1806 a search was instituted, and beneath a projecting portion of the wall two stones were found firmly clasped together by iron bands. On being separated, they disclosed a silver case shaped like a heart, bearing the name and arms of Lord Edward Bruce. When this was opened, it was found to contain 'a heart carefully embalmed in a brownish-coloured liquid.' Drawings were made of the shell, and it was again consigned to its position in the vault, where a brass tablet, with the Bruce motto, 'Fuinus,' now sets forth the tale of the silver heart.

To Sir George Bruce, an ancestor of the unfortunate duellist, Culross owed much of its early prosperity. He was a man of considerable enterprise, and started pans for the manufacture of salt; he also worked coal below the Firth of Forth by planting shafts and surrounding them with walls rising above the water-level. When James VI. visited Scotland in 1617, he invited his hunting-party one day to dine with him in 'a collier's house,' meaning Culross Abbey, the residence of Sir George Bruce. While the king was inspecting the coal-works, he was unexpectedly brought out at the sea-mouth of the shaft, and observing the water all round, his timid mind suggested foul play, and he immediately began to shout 'Treason!'

'The collier' quickly soothed his unkindly fears by showing him a well-manned boat lying ready for his reception.

Through the influence of Sir George Bruce, Culross was erected into a royal burgh in 1588 by James VI.; and this monarch also granted a monopoly of making girdles, or rather corroborated a previously given charter which had been disregarded. A girdle is a flat plate of iron upon which scones and oatmeal cakes are baked over the fire, and was formerly found in almost every household in Scotland. The girdlesmiths were a very powerful body, and their guild or corporation received a halfpenny on each girdle manufactured, in return for which they permitted the use of the trade device, a crown, a hammer, and the name 'Culross.'

At Preston Island, a low desolate piece of land, farther down the Firth than Culross, and at some distance from the shore, the manufacture of salt, already alluded to, was carried on; but it has long been discontinued, and the buildings have fallen into picturesque decay. From this island the view up the Forth is very fine; the hills beyond Stirling rise in the background; in the middle distance, long points of wooded land jut into the water; and the castellated tower of Dunmarle Castle appears over the dark band of trees that clothe the nearer hillside. A tradition exists that the mansion-house of Dunmarle is built on the site of Macdull's castle; but it is probable that the chieftain's stronghold was farther to the east. Culross Moor, inland from the town about a mile, however, was the scene of King Duncan's battle with Sueno of Norway, described in Ralph Holinshed's *Chronicle of Scotland*, where Macbeth and Banquo are said to have each commanded a division.

Dunmarle Castle was the property of Mrs Sharpe-Erskine, who died in 1872, leaving the house and its contents 'for the promotion and study of the fine arts.' The castle is open to the public certain days in the week, and contains a very fine collection of china, pictures, &c. In the hall are eight finely carved oak chairs, reputed to be by Albert Durer; and in the staircase window some beautiful stained glass of the sixteenth century, including a 'Madonna and Child' by Holbein, is exhibited. Among the pictures, the finest is a 'St Romaine' by Carlo Dolce; there are also good examples of Hobbema, Ruysdael, Teniers, Wouvermans, and others. Some family pictures by David Allan, a Scotch painter, chiefly known by his illustrations to *The Gentle Shepherd*, are of little note; but among them hang a very fine though unfinished portrait of Erskine of Torrie by Sir Thomas Lawrence, and a painting of the beautiful Miss Kennedy, afterwards Countess of Eglinton.

In the town itself there are many interesting old buildings to be seen as we stroll through its causewayed streets, that give a clattering importance to the movements of every passing cart. Beside the Town-house is a venerable pile popularly known as 'The Palace,' a name derived from a doubtful tradition that the house was at one time the residence of one of the Scottish kings. It properly consists of two houses, one on each side of a passage known as 'the Colonel's Close.' They were built by the great Sir George Bruce; and above the centre window projecting from the roof

his initials, G. B., are carved. The gray old walls have gathered their colours from the rains and sunbeams of many a year, till now their hues are 'mellowed into harmony by time.' Part of the roof is slated with thick old slates, purple, green, and lichen covered; other portions are patched with tiles that long ago have lost their youthful brightness, and taken on a richer, deeper tone more fitting to the dignity of age. The interiors have been richly decorated in their day; the ceilings, painted with scenes from the *Odyssey* and Greek mythology, still bear witness to the former grandeur of the ancient mansion. The old place, like Grumio's story, seems destined to die in oblivion; but it needs no strong effort of the imagination to picture some of the scenes its aged walls have looked upon in the stirring times when Charles II.'s fleet anchored in Leith Roads, and every little town in Fife bestirred itself to repel the invader. From the terraced gardens behind, with their trim close-cropped yews, some maid of old romance may have looked upon a morning 'bright with May,' and watched her lover for the last time sail down the Firth to meet the Bersekers and Flemings. In such gardens as these, Cowley or Cowper would have delighted; there is a staid dignity about the box-fringed walks, and an old-world air even about the flowers themselves—

Gold-dusted snapdragon,
Sweet william with his homely cottage-smell,
And stocks in fragrant blow,
Roses that down the alleys shine afar.

The summer day is drawing to a close as we wander down the steep old streets to the green beside the shore. Here the children are laughing and shouting at play, while their elders are engaged in a friendly game at bowls. The tide is nearly full, and from a boat in the bay the voices of girls singing steal over the waters. The blue smoke is curling upwards in the stillness of the summer twilight, over the red-tiled roofs, over the dark old trees, into the glowing dallidil sky above, where the rooks are flying homeward to their nests.

LONG JAKE'S TRIP HOME.

CHAPTER II.

MORE than three months passed before Long Jake was again seen at King-parrot Flat; and then, one fine afternoon, he dropped in upon the boys in John Byrne's bar without a word of warning. He was warmly greeted. John Byrne's handsome face lit up with an evil light as he clapped the newcomer on the back with demonstrative heartiness; Jack Rogers, already three parts tipsy, foresaw earlier consummation than he had dared to hope for; and Surgeon-major Wagstaff—late of H.M. Bombay Staff Corps—deemed it a promising speculation to begin business by pledging Long Jake at his, the surgeon-major's, expense. To the speechless amazement of all, this delicate overture was politely but promptly declined.

'No, boys,' said Long Jake quietly, in answer to the questioning faces that were turned indignantly to his; 'I ha'n't come here for a boose—not this time;' and he calmly seated himself on a flour-bag in the coolest corner of the store.

Jack Rogers feebly appealed to his stars to explain what this might portend; the old Anglo-Indian ripened with more than tropic rapidity from pink to purple, and muttered vaguely about 'outraged honour' and 'instant satisfaction'; while the proprietor of the bar confined himself to a peremptory inquiry as to why, et cetera, Jake came there if he didn't mean to take anything for the good of the house—adding that he, for one, as boss of the shanty in question, intended to know the reason why, anyway.

'Reason why?' said Long Jake reflectively, without looking up from the fig of tobacco he was daintily paring in his palm. 'Reason why? Why, to have a bit of a yarn. What else?' But before the menace that trembled on John Byrne's tongue could be discharged, he added adroitly, and with a quick upward glance: 'How's ever, though I'm not on for anything myself to-day—feeling just what you call below par, like—I hereby invites all present company to order their usual, if *you* please.' With that Long Jake added to the painful interest which his abnormal conduct had already created by shifting the clasp-knife to his left hand, thrusting his right deep into his trousers' pocket, and, apparently by accident, jingling a fistful of coins. Then he withdrew his hand without raising his eyes, and resumed paring the tobacco with an impassive face.

Coin of the realm being an almost unknown quantity at King-parrot Flat, where paper-money was in common currency, this master-touch of Long Jake's produced an instantaneous effect. John Byrne turned his back, partly to uncork a fresh demijohn, partly to conceal his emotion. The rest—including even the insulted surgeon-major—maintained a judicious silence. The man from Razorback reserved his final bomb until the first glass all round had been emptied, and until he had rolled his tobacco caressingly between his palms, and filled and lit his pipe.

'Fact is, boys, he then said, in the same calm deliberate tone, 'I'm going home!'

The silence that had preceded the announcement outlived it half a minute; then, as one man, the habits of Byrne's bar pulled themselves together.

'What! home to England?' asked John Byrne incredulously.

'Home to England,' said Long Jake.

'Gad! you don't mean this?' exclaimed Surgeon-major Wagstaff.

'My colonial oath on it,' said Long Jake.

'An' when yer goin'?' inquired Jack Rogers.

'Well, not *jest* yet a while,' said Long Jake.

This last reply, being distinctly anti-climacteric, disappointed somewhat.

'Going for good?' sneered John Byrne, veiling beneath a tone of contempt the reasonable annoyance incident to loss of a sure source of income. Jack Rogers, with a vinous wink, suggested: 'No; for bad.' A slight laugh greeted the maudlin sally. But Jake replied gravely: 'Only for a trip. I mean to have one more look at the old dust; that's all.—Fill up again, boys.'

The invitation was scarcely needed; and, under the influence of the whisky and Jake's manoeuvring, the conversation drifted; and he presently turned it into the channel he had all along in view by an innocent inquiry after Widow

Truscott. The gratuitous information respecting this lady which he elicited it would be to no purpose to relate at length; moreover, it would be unfair, since the epithets employed could scarcely have been meant for repetition. But it did appear that Mrs Truscott was, to put it mildly, no favourite at King-parrot Flat. Her airs were worse than ever. She thought herself too good for everybody. She was mismanaging the store, making a mess of everything, and doing no business—each substantive being duly qualified. There were plenty of good men ready to enter the business on the square footing, who would guarantee to make a paying concern of it. Yet she wanted to sell the place—sell a place whose good-will wasn't worth a red cent; she would look at none of them. Here the gallant Surgeon-major waxed peculiarly eloquent and pompous. It seemed that this oriental jewel had indeed gone the length of personally offering himself, body and soul, as a sacrifice at the shrine of this unreasonable woman. Only to be trampled on!

As Long Jake cantered homeward, he could not resist a curious glance at the dwelling of the terrible female. If she treated so maleficiently those estimable men, whose worst offence was a too great admiration for herself, how would she behave to him, Long Jake—as he persisted in regarding himself—the author of her widowhood? Might she not send a bullet through him as he passed? Surely she must be capable of that much. She happened to be in front of the house, training lovingly an infant creeper to the base of a veranda-post—honeysuckle, taken from its native northern soil only a few short months ago. She looked up swiftly at the cantering horseman. As it seemed to him, there was nothing forbidding in the glance; nor did she lower her eyes; but, instead, gazed hard at him with something very like interest in her sad face. Long Jake felt the blood mount hotly to his cheeks, and his hand tighten involuntarily on the reins. For an instant he wavered; then, turning away his head, he spurred the mare round the fatal corner. But he had not galloped a furlong before his first impulse of shame gave place to one of indignation, of which he himself was the object; he fell to cursing himself for a fool and a heartless wretch; and by the time he reached the hut, he had resolved that, next time anything took him to the township, he would not leave it before he had told the truth to the poor widow about that terrible day, now nearly four months ago.

It was a little curious that, barely a week later, Long Jake found another trip to King-parrot Flat necessary. He had never before visited the township twice in so short a space of time. It was more curious, however, that he ended by getting no farther than the outermost vedette of the straggling, weather-board houses—by calling, in fine, at Mrs Truscott's store and nowhere else.

'I must see the woman; I must make a clean breast to her about that day. I must tell her straight that I was blind drunk and riding madly; that if I had been in my sober senses, the accident would never have happened.' Such is a paraphrase and a condensation of Long Jake's conception of his duty, arrived at after hours of slow laborious thought. The logic of the con-

clusion was more than questionable; and as for the prompting that led to it, Jake was simply self-deceived. Even supposing any good sprang up from the unburdening of spirit, it would be reaped by the wrong person; a load would be lifted from Long Jake's heart, not a pennyweight from Mrs Truscott's. Yet, as he reined up at the store, Long Jake honestly believed that he was about to do the next best thing to reparation, which was impossible. Mrs Truscott sat sewin behind the green veranda-blinds—voluptuous extravagances hitherto unknown in the pure air of the Flat. The tall ungainly bushman trembled visibly as he stepped up the little path, crishing his soft wideawake between the twitching fingers of both hands. Instantly, however, the sweet, smiling smile with which the young widow looked up at his troubled face disarmed him; that ice-breaking sentence, so carefully prepared, so often rehearsed, went clean out of his head; and Long Jake, for one faint-hearted moment, would have given far more than his credit balance at the station to be safely back in his hut!

Yet a moment later the plunge was made—veritable flounder of incoherence. Then, coming up—so to speak—for breath, a series of verbal splashes followed, tremulous with rough pent-up emotion; for some seconds the words chase each other tumultuously from his hoarse throat, then ceased. And the widow knew all that had been on the poor fellow's mind for months past.

How did she hear it? Silently, at first; then, with a slight catch of the breath; then with quiet tears. And when all was said, she leaned forward on her low chair and pronounced, not forgiveness, but words of *thanks*. Thanks for his tenderness to *him*; thanks for his forbearance with her on that awful day. Thanks to him! The man recoiled, and shuddered, and refused to believe his ears. He felt stunned, when reproach could have stunned him! But a thin white hand was stretched over toward him, and whether he would or no, it buried itself in his great coarse fist. He dropped it quickly, drew a deep sigh, half of relief, half of bewilderment, wiped his shirt-sleeve across his brow, and without a word, stepped from the veranda.

Mrs Truscott called him back. He must stay a little while, she said kindly, and talk to her she never talked to any one, you see. Jake sat down humbly; he would have done anything she told him, just then; but what could he talk about? Silence. Jake shifted nervously. Some subtle instinct whispered that he would be even more disgraced if he left the lady to begin the conversation. So he stumbled into this: 'I'll goin' to clear out o' this soon.'

The widow looked up from her needle-work in surprise, as well she might. 'How do you mean?' asked she, not without apprehension.

'These here ranges: I'm going to leave 'em.'

'Yes?'—in a tone indicating interest.

'Yes'—in one betraying exhaustion of topic.

'And where do you go then?'

'Ha!'—with unexpected relief, and surprise, that he should have forgotten what was indeed his point—'home to England!'

Mrs Truscott dropped her work on her lap and looked swiftly up at the speaker. And for a single moment—in spite of her thin worn cheek,

in spite of the lines that had come ten years before their time—for that one moment the parted lips, the wide-open blue eyes, the sudden flash of strong interest, lit up the woman's face into beauty. The next, the blue eyes filled with tears, the chin drooped, the cheeks went paler than before, and a broken voice repeated in a wondering whisper: 'Home to England!'

'Yes,' said Long Jake softly; 'home! For a trip.'

But he had no sooner uttered the words than he jumped up clumsily without a word of warning and stepped hastily out of the veranda. Almost instantaneously, Mrs Truscott heard a shrill exclamation, followed by a volley of angry words.

'Why, whatever is it? Ah, dear, dear, dear!' she cried, rushing out, with something akin to a fresh pang in her heart.

'It's only this, ma'am,' he cried savagely, throwing out a dramatic arm in the direction of a dark little figure that was racing rapidly down the broad bush high-road towards the other houses: 'that there little snake has been a-hiding behind this here picket-fence and a-listening to every word you and me has been a-saying. Confound her!'

The widow turned; and, though the evening gloom was settling rapidly, it needed but a glance to assure her that yonder skeltering imp was the one human creature in the township in whom she took any sort of interest—little Martha Byrne, whom she had even attempted to teach to read. The hot blood mounted to the woman's faded face. She faced about. But Long Jake was gone. Growing momentarily fainter, his mare's rhythmical canter was borne to Mrs Truscott's ears as the strokes rang out from the flint-strewn track. The widow sighed deeply. Every breath she drew was a sigh; but this one came with new force from a new pain; or rather, from an ever-present pain re-awakened.

'Poor thing!' said Jake aloud, as the mare dropped into a walk at the foot of the steep winding track over Razorback. 'No signs of business, as I could see. Why, the place was never fairly started. Poor thing!'

Nearly an hour later, he put the mare into a canter at the top of the long gentle slope that stretched, through miles of timber, right down to the hut; and then he was thinking of that look of Mrs Truscott's when he spoke the word 'Home!' 'Ay, she'd go home too, fast enough; if she had the money,' thought Long Jake.

With the quickened stride of the mare, the rider's thoughts, too, came the quicker. At first he made no effort to check them; but presently he found himself spurring on the mare in order to leave them far behind. The grotesquely-twisted gums fled by on either hand, bowing mockingly in the evening breeze as he passed; then the round moon shot up and painted the narrow track an ashy gray, and threw into merciless relief, among a world of phantoms, one solitary mortal flying from a Thought. But the Thought was not to be run away from. It twined its tendrils about the man's mind, and grew and grew until he became hardly conscious of the trees rushing by; the long gray track reeling out beneath, the scent of the eucalyptus forest tingling in his nostrils. Suddenly a peal of harsh

grating laughter broke upon the silence. The rider instinctively pulled up. The hoarse diabolical peal was repeated; but this time it was echoed by a low chuckle from Long Jake. He had lived in the bush more years than he could count; yet here, forsooth, he was startled by the bushman's familiar, the laughing-jackass! The momentary sensation, however, had an immediate effect: Long Jake shook himself together and rode slowly and soberly onward. Not that the Thought was expelled; it was allowed to remain, but on a different footing; for now it was no longer resisted, but willingly, coolly, discriminately entertained.

Before starting on the rounds of his paddocks next morning, Long Jake made a calculation with the butt-end of his stock-whip on the sandy soil outside the hut door. When the sum was worked out, he stamped out the figures, as if ashamed. Yet he had merely satisfied himself that in three months' time his gross savings would amount to pretty nearly fifty pounds. 'And on that,' said Long Jake slowly, 'and what the mare brings, we might manage it.'

The spring months that followed were trying ones to Long Jake. He never went near King-parrot Flat. One or two trips he made over to Wattle-town, in order to negotiate for the sale of the mare with a storekeeper there, which ended in a bargain being struck that the mare should be delivered and paid for by Christmas at the latest; but on these occasions Wattle-town observed that the man from Razorback conducted himself very meanly, and that the little money he did spend was in hard cash. In point of fact he made it his first business to cash a small cheque at the bank on entering the township. Then, of course, there were the inevitable visits to the home-station. But only two circumstances happened really to break the monotony of life, which, after years and years of it, became actively unpalatable to Long Jake's temperament for the first time. The first of these was a visit from handsome John Byrne, who slept at the hut on his way to the home-station, where—so he said—he had business with Mr Noble; though, in fact—which he omitted to add—he paid Jake the compliment of travelling many miles out of his way in order to see him, since he came straight from the lair of a lynx-eyed congenial spirit at Wattle-town, and not from the grog-shanty on the Flat. The visitor, however, was too welcome for Long Jake to consider the visit mysterious; and as for sinister glances and cunning questions, Jake neither saw the first, nor was he even aware that the second had been put—and answered.

The other circumstance was this: one day he found lying in the station store an envelope addressed to 'The Boundary-man on Razorback.' It contained a few lines from Mrs Truscott, begging Jake to call at her store before his departure for England, provided he should consent to be the bearer of a message and a trifle or two besides. He spelt through the note with difficulty, then laboriously indited a reply and dropped it into the mail-bag. In his note a day in December was mentioned on which he would without fail present himself at Mrs Truscott's service. After that, with a feeling of satisfaction quite new to him, he inquired for the boss. Mr Noble, who had already heard with amusement of Jake's projected

trip home, was not surprised to hear now that he intended coming in for his cheque about the middle of December. Jake, however, promised to stay until a new boundary-rider should be sent out to the hut, which, it was in turn promised, should be done a day or two before that on which he wished expressly to leave.

As December drew gradually nearer, he grew daily wearier of his daily work. He became restlessly impatient; and his nights were broken by vivid, disturbing dreams. As a rule these dreams bore him back across seas of time and the world to a peaceful little hamlet in Somersetshire. But they invariably ended by the distant and indistinct image of the English village fading before the strong, convincing presentment of King-parrot Flat; or the two places would be fused fantastically together, as is the way with dream-locality.

When at length the great day dawned, Jake set out for the station at sunrise, riding the mare, and carrying all his personal belongings in the swag strapped across the saddle. At the station, Jake received his breakfast and his cheque; the latter—the account coming to a few pounds under fifty—being written for that round sum, thanks to a graceful bonus from the boss. Thus emancipated, Jake rode on to Wattletown with a heart of air, leading a station horse which Noble lent him for the completion of his roundabout journey to King-parrot Flat. At Wattletown, the mare was sold, according to previous arrangement, for twenty pounds down in cash. The cheque also was cashed—all gold; so that when Jake rode away from that prosperous settlement at four in the afternoon he had seventy sovereigns in the leather pouch on his belt, which was imprudent, in spite of his modest conviction that not a soul was concerned—and therefore, he argued, not a soul could be acquainted—with the movements of so obscure an individual as Long Jake.

After an hour's easy riding, Jake was once more on thoroughly familiar ground; for half-way between the Flat and his old hut that track was joined by the one from Wattletown. Never had this man's spirits been so high before, never had the sombre tints of the bush seemed so warm and gay in the glinting sunlight. The gray rough track had never bounded so lightly from the heels of the good old mare; though surely this heavy bony hack was not a patch upon her for speed and lightness. The excitement that had entered his spirit during the last months had given new life and animation to a narrow, silent, well-nigh animal existence. He was no longer the thing that repeatedly, for days, lay helpless at Byrne's bar, and returned to the hut he called home without a pang, without a regret, without a hope. And here it was, in these endless cloisters of smooth round trunks, that the Thought had come to him which had worked all this wondrous change—the Thought that was now at last to be put to the test, whether it was wise or unwise, good or evil!

'Ha, ha! Ha, ha!'

Ah! that could startle him *then*, but not now! Long Jake turned round in the saddle to look at the queer clumsy bird—surely a bird of good omen. But he did not slacken his steady canter.

'Ha, ha, ha!'

This time the laugh did not come from behind. Jake turned sharply. Directly in the track sat a

tall, motionless, masked figure on horseback; and a voice that Jake thought he recognised cried: 'Bale up!'

Bale up!—the seventy sovereigns! Jake's heart quailed and sickened for a moment. The long barrel of a revolver covered him, and glittered in the sunlight. Must he be robbed in broad daylight? With a wild cry of rage and despair, he buried his spurs in the sides of his heavy mount and dashed straight at the highwayman, leaning forward with his face on the horse's mane. The robber, being less heavily mounted, backed a pace; and as Long Jake came on unarmed and reckless, took deliberate aim at the chest of the charging horse. A firm quick touch on the reins caused the heavy brute to swerve; and with a loud ring the bullet struck the near stirrup-iron, thence burying itself in the heel of Jake's boot. The frightened animal thundered on; and in an instant they were past, nearly bringing the smaller horse to earth in their rush. A quick succession of shots and an even louder volley of curses filled the air; Long Jake felt a stinging, burning blow between the shoulder-blades; his brain sickened, and his body reeled in the saddle!

Just as the fiery sun began to dip behind the range, Mrs Truscott heard a furious clatter of hoofs outside. She rose hastily and ran out. So did Martha Byrne, whom the widow had tried in vain to get rid of all the afternoon. Staggering through the little wicket-gate was a strange figure, all dust and sweat and blood, and the ashiest face man ever reeled under. He made his way unsteadily up to the veranda, where he sank down with a deep sobbing sigh; and his head would have fallen back upon the boards had not the widow caught his shoulders and supported him. His breath came thick and short, his eyes seemed closing; yet his fingers fumbled feebly until they had unfastened a leather pouch from his belt. And then his hands were powerless to lift it!

The stricken man looked dumbly upward at the woman; he could just raise a trembling pointing hand to her, then drop it significantly on the pouch. His wan lips moved, and from between them came one faint word: 'Home!'

Little Martha had for once used her long thin legs to some purpose. After one quick intelligent glance at the pallid face of Long Jake, she had rushed like the wind to her father's shanty; and now she was returning, almost as swiftly, with a posse of its choice spirits. John Byrne was absent, and mysteriously absent, from the township; but foremost among them was Surgeon-major Wagstaff, carrying his instrument case and a vastly augmented pomposity of bearing; and devoutly hoping that, whoever the fellow was, he would live long enough to give him (Wagstaff) a show of getting his hand in once more. Jack Rogers was there too, and Paddy Welch, and one or two others. As they came up to the end of the store they could see right along the raised veranda. With the carmine glare of the setting sun behind them, the two figures that met their gaze seemed of carved ebony, both were so black and so rigid! As one man, the little party slackened its pace; Paddy Welch doffed his felt wideawake, and the others did the same; then they moved forward very, very slowly. And Jack Rogers said, just above his breath, 'but,

somehow, more gruffly than he intended to say it: 'He's gone home square enough now, boys; and for good!'

Yet darkness fell over King-parrot Flat, and the boys still lingered outside the widow Truscott's store. For the Surgeon-major said there was still the ghost of a chance; and the Surgeon-major was sober and on his mettle, and ought to have known, even if he didn't.

That day week they ran John Byrne to earth in the ranges. They dragged him back to the Flat, and would have lynched him in sight of his own bar, but for one circumstance. The ink was scarcely dry on an official bulletin nailed to the door of the now flourishing opposition shanty which set forth that the patient was at last definitely out of danger. And they found its author, the gallant and skilful Surgeon-major, already gloriously drunk after his week of enforced sobriety by the sick man's bed.

So Mr John Byrne, amateur bushranger, was taken over to Wattlestown and handed over, quite nicely, to the police. Thanks to a woman's nursing and a Surgeon-major's experience, Long Jake pulled through. Just when the days began to shorten, and camping on Razorback became mean work, the shutters were put up at the new store. A week later, Long Jake's trip home began. But Jack Rogers turned out quite right after all: the trip was confessedly 'for good.' Nor was it made alone.

* THE POSTMAN OF THE ATLANTIC.

'WHAT news, Pat?'

'Sorra a bit, sir;' and Pat proceeds to puff away steadily at his pipe.

The harbour-waters lie so quiet before us, that the lights of the shipping are almost as steady as those other lights which we know to shine from the hills. Beneath us, at the edge of the wharf, the engines of the tender snort and splutter, and, save Pat's pipe, this is the only sound to be heard. The whole world seems in silent waiting for the arrival of the Ocean Postman. Six days and some hours have gone since he sent word that he had started on his race from New York; and soon from the watch-tower of a western cape—upon whose slopes we lay idly, yesterday, watching the waves roll in below—there will be telegraphed word that, far out on the Atlantic, he has been marked steaming fiercely to the eastward with his letters for a hundred thousand homes. Until that message shall come, we must rest; for weary limbs remind us how, earlier in the day, we climbed the cliffs to their farthest verge to watch the great sea-steamers creep past and disappear in the haze of the west.

It is scarcely ten o'clock, yet the little town seems already asleep. A watchful revenue officer pauses to glance somewhat suspiciously, as we near the sheds he guards, but his face brightens when he recognises us.

'A dark night, sir.—Any news?'

'Not yet.—Good-night.'

'Good-night, sir;' and he resumes his lonely walk as we turn up the hill for home.

'Here; wake up; there's somebody below.'

'Eh?'

'Turn out; there's a knock.'

Our friend, well used to being roused at these uncanny hours, is at the open window. 'Who is it?' he asks.

The answer comes in a rich brogue: 'Me, sorr; and Pat says if ye'll please hasten'—

The night-air is cold, and we are unrobed, so the rest of the message has to be taken as heard in the noise of the descending window-frame.

We have little time to waste. Even as we dress, we know that the keen prow of the swiftest ship afloat is cleaving the dark waters in a mad race with time. Not a trace of dawn. We go down the hill through darkness that can almost be felt; for it is cloudy and the street lamps were put out long since.

At the quay, all is in readiness. The old gray-haired north-country sea-captain looks askance at us as we step on board the tender, and there is a significance in his tone as he draws out: 'Are ye ready now?'

'Yes, captain.—Go ahead.' We turn and walk aft.

The little vessel trembles, as the first stroke of her paddle-blade sends a great ring of foam spreading out into the night. Slowly she turns—labours for a moment, and then, as it were with a glad leap, speeds forward to meet the Postman.

Perhaps you may wonder why he needs to be met? While we steam into the outward channel, and along between the ghostly lines of anchored ships towards these sleeping forts that guard the harbour-month, you shall be enlightened.

The harbour of Queenstown, whence we are setting out, is not the harbour of the homeward-bound mail-steamers, which pass on to England. When, however, the tide threatens, as it often does, to keep the incoming mails waiting outside the English port, then, from Queenstown, the ocean steamer is intercepted by our tender, and the mails are transferred, to be forwarded by a special train, through Dublin and Holyhead, to London, where, perhaps, they may be delivered and read before the giant who carried them from the New World has crossed the harbour-bar at Liverpool.

Of those who come out with us to meet him, some are here by necessity, as our friend, who will receive the mails, and the Customs officer, who will see that nothing else is received. By necessity, too, comes the pilot, who, when the mails are discharged, will carry the giant on to Liverpool; and, by necessity also come the burly detectives, good-natured representatives of the powers that be. By courtesy come the news-boys, the railway agents, and the hotel guides; and sometimes the agent of the Central News drops in to steal an early copy of the *New York Herald*, and to ferret out, in the few minutes he will have, all the news that he can of the voyage—who was born; who died; what dangers have been passed, and what strange sights seen.

We are nearing the forts now, and for a moment are at rest, though the engines throb on to fight the incoming sea. Away towards what we know, despite the darkness, to be the land, the light of a lantern rises and falls. It is the boat of the harbour-pilot, who joins us that, in case of trouble, he may guide the ocean steamer to anchorage here. Nearer and nearer the surging light gleams. We can see the faces and arms of four stout boatmen labouring to carry their boat in the teeth of the

tide. Stroke by stroke they draw near until close by, and the pilot waits a wave that shall enable him to clamber on board.

We speed on again. To our left, from the cliff a lighthouse flashes and darkens, as it will flash and darken again and again until the sun by-and-by shall put it out. There is a gray tinge in the far east, and we can feel the little vessel rolling with a new and sickening regularity. We have entered the open sea. We draw our mufflers tighter and press our caps down as we face the mist-laden wind. No one speaks.

The engines move ceaselessly: pulse, throb—pulse, throb; and a long white trail fades away behind us. Every nerve is strained as we gaze to the west, where, we are assured, the ocean steamer's head-light will soon be seen.

'And a fine head-light she has, too,' says our friend proudly; 'we shall sight her miles away.'

Good-naturedly, yet contemptuously withal, the night-glass is handed to us; and somewhat unsteadily we guide it to what we think must be the horizon. Save the solitary lantern of the light-ship due south, not a trace of light is to be found.

The captain paces to and fro beside us, and, careless as he appears, be sure that his eyes scan the western sea anxiously. His voice is first to break the silence: 'Send away there.'

'Mind the sticks,' says our friend as he leads us to shelter. As we move, the rockets leap from the lower deck. Far away to the south-west is seen an almost imperceptible glimmer, the first faint gleam of the Postman's lantern, and, like tiny falling stars, his distant answering rockets flash across the black sky.

Pulse, throb—pulse, throb. The engines quicken. From below, the deck-hands carry up dry gratings, and place them in readiness to keep the mails from the damp deck.

Half an hour passes. The Postman's lantern is rising now like a planet from the waves. Through the glass we can distinguish a black hull dotted with tiny lights, and the white foam leaping from the prow.

We speed on. Very majestically the ocean steamer moves towards us in the gray light. With what terrible strength she comes! Woe to the vessel that should cross her path! Impetuous, like a living thing, she dashes past a quarter of a mile distant, though her engines were stopped long since.

'Go after her!' growls the captain, and our engines throb again until we are alongside.

'Stand here,' says our friend, 'and take care not to get in the way. Time is too precious for ceremony.'

What running to and fro! What casting of huge hempen hawsers to bind us fast to the giant, whose iron wall is outlined with faces of sea-tired passengers!

We slip on board. The saloon and the great palace-hotel that surrounds it are of less interest to us than the mails, and very soon we manage to leave our excellent detective guides, that we may creep quietly up to our friend as he stands by the gangway.

We peep overside. How the great ropes groan and tremble, and how the little vessel leaps beside the apparently motionless giant!

'Forty—two, five, nine; fifty—three, seven,

eight; sixty—one (steadily, there!), four, seven; seventy.' Bag by bag the deck-hands are hurrying the giant's letters forth. Some carry but one bag, some two, some four; and the officers at the gangway head tally with a precision born of habit.

Now the hundreds of bags lie snugly piled upon the tender's deck below, and the passengers with their luggage follow. The dainties for this morning's breakfast in the saloon have been carried on board; the last newsboy scuttles out, the gangway is drawn up, and the hawsers cast off.

'Good-bye—Good-bye.'

The friends of a week wave farewell from the receding ship. A faint cheer echoes over the sea; and the huge vessel, with the pilot on board, steams away into the glory of the rising sun.

As we turn back to the now visible hills, among which the harbour nestles, wonders such as only Turner could paint and only Ruskin could describe, flush the sky and gleam again from the sea—wonders of saffron and green, of red and of gold. The passengers as they stand to watch are mostly quiet and very pale. Here and there, some self-confident citizen of New York in a high-pitched tone 'guesses' little of the old country. What wonder! He has none of that strange home-love which, by-and-by, will force this pale-faced Irish lady to set her teeth, and cough ominously, and turn seaward to wipe away her tears.

The lighthouse has done its duty, and has gone to sleep, and along by the fort the flash of the sentry's bayonet may be seen. In the harbour, no one is yet awake; but the ships lie clean cut in the sunshine as we hurry on between their lines to the wharf.

'Stand back, please; stand back there—mails first.'

Passengers, visitors, tradesmen, all are set aside that Her Majesty's mails may pass by.

'One, three, five, nine, ten;' and so on as before.

The engine of the express train shrieks, the doors close, and away the mails go, overland, to distance thus their old friend the Ocean Postman, who has gone on to England by another road.

THE MONTH:

SCIENCE AND ARTS.

MR PRITCHARD MORGAN'S gold mine in Wales seems to have fulfilled the sanguine hopes of its promoter, for during the past year no less than thirty-six thousand pounds' worth of the precious metal has been extracted from it, in addition to a mass of quartz which awaits crushing, and which, if the yield should continue the same, must contain half a million's worth of metal. The average yield gives a profit of five pounds twelve shillings per ton, which is about one pound per ton more than the richest gold-fields of Australia ever brought to their owners. Improved machinery, facilities of transport, and other circumstances, will of course contribute to this result. It is to be hoped that the Crown royalties upon such property will be dropped, as the tax has an injurious effect upon such an enterprise. A correspondent of the *Times* points out that under the Mining Act of Ontario

all lands are free of royalties and duties in respect to any ores or minerals thereon, and that this exemption from tax has encouraged enterprise and labour, and has thus had a most fortunate effect upon the wealth of the country.

We are glad to note that, in connection with the Agricultural Show at Windsor, the Farriers' Company will offer prizes for the shoeing of horses. These prizes will vary in amount from one to ten pounds, and the competition for them will be limited to Windsor and the metropolitan area. Each competitor will have to fix a fore and a hind shoe, and must be prepared to answer questions with a view to test his knowledge regarding the anatomical structure of the horse's foot. This is a step in the right direction, and we trust that it will be followed by the granting of certificates for the practice of a trade which is too often left to unskilled and therefore cruel hands.

In many philosophical instruments, fine threads are employed. Thus, in the telescope, threads from the spinneret of a spider are used, and in some observatories a special kind of spider is bred, so that the supply shall not fail. In delicate galvanometers, again, the little mirror which, by a reflected beam of light, denotes its slightest movement, has to be hung by the finest fibre of spun-silk. Mr C. V. Boys has, however, shown by experiment how much finer threads than nature affords can be made artificially; how it is possible, indeed, to make one less than the ten-thousandth part of an inch in diameter. His method of production is as follows: He melts in an oxyhydrogen blowpipe flame a piece of rock crystal, which he draws into a rod; then, taking this rod, he once more melts it, and drawing a fibre from it, attaches that fibre to an arrow. Still holding the rod in the flame, the arrow is suddenly shot from a bow, and draws out with it a tiny hair of rock crystal which is hardly visible without a microscope. We may note that something of the same kind is brought about in nature during a volcanic eruption, when ejected stones often have long streamers of glassy character attached to them. This glassy filamentous matter is known as Pele's hair. It is produced in abundance at Kilauea, Hawaii. Mr Boys explained his method of producing these quartz fibres at the recent conversation at the Royal Society, of which he is a Fellow.

Another most interesting exhibit there was that of Mr Brereton Baker of Dulwich College, which indicates a significant discovery with regard to the gas oxygen. We have all seen the familiar lecture-room experiments with this element. In jars of the gas it is shown that sulphur, phosphorus, carbon, iron, &c., will defflagrate with great energy and with abundance of miniature fireworks. Mr Baker has proved that when the gas is thoroughly dried all these substances can be introduced into it in a highly heated state without combustion taking place. Hitherto, this inertness has not been recognised, save that we know that iron will rust sooner in a moist atmosphere than it will in one which is comparatively dry.

The *Lancet* informs us that the practice of hair-dyeing for the concealment of one indication of the approach of age is by no means confined to the wealthy, or to those whose attention to their personal appearance is one of the great occupa-

tions of life. Working women and even men have, we are told, recourse to hair-dyeing, for the reason that when gray hairs show themselves work is difficult to procure, it being a prevalent notion among employers that gray hair means a sure sign of age and weakness. This is, of course, a mistake, for most persons have among their acquaintances those whose hair has changed from its natural colour at quite an early age. The imposture is bad in itself; but the evil becomes intensified by the employment of dyes such as those containing lead, which may have a very mischievous effect upon the general health.

The possible removal of tattoo marks has often formed the subject of speculation, and it will be remembered that it came up during the celebrated Tichborne Claimant trial. Men who, during some idle moment, have permitted themselves to be thus marked, have often in later years, when in another sense they have become 'marked' men, wished that they could eradicate the blue lines upon their skins, and have tried various strong agents, such as vitriol, to burn them out. A writer in a French scientific journal gives the following recipe for eradicating tattoo marks with success. The skin is first of all covered with a strong solution of tannin above the marked places, re-tattooed with a needle, and then rubbed with a stick of lunar caustic (silver nitrate). Afterwards, the skin is treated with powdered tannin several times for some days, with the result that a dark crust is formed, which subsequently comes off, leaving only a redness behind. This, after a time, almost disappears. It is pointed out that only a small patch of skin should be operated upon at a time, so that the person treated can be free to work at his usual occupation without confinement.

Thoughtful persons who visit the Great Exhibition at Paris, and who will possibly ascend the great Eiffel Tower, will be apt to ask of what good is this curious structure beyond showing what iron girder-work can accomplish. That it will prove a great attraction to many visitors from all parts of the world is most probable, for the ordinary sightseer is always pleased with novelty, just as a child is delighted with a new toy. But this pleasing of the multitude seems to be a little thing towards countenancing such a huge undertaking. There is, of course, the commercial side of the enterprise to be considered, and if it be true that ten thousand persons can be accommodated on the various floors of this modern babel without inconveniencing one another, the returns from gate-money will yield a rich harvest. It is to be hoped, however, that anticipations of the usefulness of the structure as a meteorological observatory may be realised. Certainly, observations taken under such conditions have never before been possible, for we cannot compare a shifting balloon with a firm structure such as this presents. It has already been announced that three laboratories will be erected on the Tower, one for astronomical work, another for meteorological instruments, and a third for the periodical testing of the atmosphere. It is also stated that from the highest platform cloud-photographs will be taken daily, with a view to systematic study of cloud-forms over a wider area than has before been possible.

Some Roman remains have recently been

unearthed at the Beddington Sewage Farm, near Croydon, Surrey. These take the form of solid brickwork channels, which doubtless formed the heating apparatus for baths, and are similar in arrangement to structures which have been excavated elsewhere. It is thought probable that this discovery may point to the near proximity of a Roman villa. The site of such a villa was found about a mile from this spot in the year 1860.

Another interesting discovery has been made at Rochester, where, near the beautiful west front of the cathedral, have been found the foundations of an apse. It is believed by some that these remains may belong to a stone church built by Æthelbert in 604, being the year in which the sees of London and Rochester were established by St Augustine. If this be true, these old foundations would represent one of the first Saxon churches built of stone in this country. Archeologists will no doubt soon settle this interesting point.

A good cement for mending cast-iron which has become cracked through heat, as in the case of any kind of retort, is said to be compounded by mixing asbestos with a sufficiency of white-lead to make a stiff putty. Such a cement can be applied to a retort whilst hot, and it will soon set, and make a permanent and durable joint.

The idea has been mooted that India-rubber roads in London would be a desirable innovation; but we fear that unless some cheaper source for that material be found, the proposal cannot be realised. We may mention that for some years a short length of road has been laid with India-rubber at the *Midland Hotel*, London, to deaden the noise of vehicles passing into the great station.

It was stated some time ago by Dr Zenger, of Prague, that valuable contributions towards weather-predictions might be obtained from photographing the sun, provided that the plates used in the work were those known as isochromatic (a word which very insufficiently describes a gelatine plate which will reproduce colours in their true *tone* relation to one another). Such photographs, he tells us, will indicate with great certainty the coming of atmospheric disturbances of all kinds; for on the approach of storms, the pictures will show round about the sun rings of circular or elliptical shape. If this be the case, it is obvious that at all naval stations where storms are common, the necessary apparatus should be provided for taking daily photographic images of the sun. The recent cyclone, which was so disastrous to the American and German navy, might have been foretold by such means.

Mr A. H. Walker has invented an oil cartridge for use at sea in making rough water smooth. The cartridge is fired from any form of firearm, and is so constructed that, on touching the water, the oil will escape and spread over the surface. In connection with this question of the use of oil at sea, we may mention here that a correspondent of the *Army and Naval Journal* suggests that the ancients learnt the efficacy of the system from the habits of sea-birds. Fish-eating birds, it is stated, have the power of ejecting oil from the mouth, and they invariably do so when captured. This writer has seen such birds floating in spaces of comparatively quiet water, when all round the sea was rough. In both the

South Atlantic and South Pacific, he has noticed this phenomenon, and believes it to be due to the oil ejected by the birds themselves.

Professor Möbius, referring at a recent meeting of the Physiological Society of Berlin to the habits of so-called flying-fish, stated that it was quite an erroneous idea that these creatures possessed any such powers of flight as are characteristic of birds, because the anatomy of their fins and muscles is not adapted to any such action. The fish, frightened at the approach of a vessel, will jump out of the water, as other fish will, and is then supported on the wind by its outstretched and evenly balanced fins. Some have supposed that the fish exhibited true flight, because of the buzzing noise with which its movements are accompanied; but the Professor says that this same noise can be obtained when a current of air from a pair of bellows is directed towards the fins of a dead fish. The rising motion of the fish over the waves can be explained by the upward currents of air which are produced by the horizontal wind striking the curved surfaces presented to it by the water. He thus concludes that all the motions of the fish in the air are quite passive.

The phonograph has lately in the hands of Dr Pinel of Paris done good service in throwing light upon that curious condition called hypnotism, which, ever since the early experiments of Mesmer, has puzzled the thoughtful, and has been a fruitful source of wonder to the credulous. Dr Pinel finds that hypnotic patients will obey the directions conveyed to them mechanically by the phonograph as readily as they will obey living words. He argues from this, and it would seem with much good sense, that the theory of animal magnetism—that is, a magnetic current passing from operator to subject—must be entirely baseless, and that the real cause of the phenomena of hypnotism is due to a disordered mental state. Those who have closely watched experiments in hypnotism, and noticed the comparatively small number of persons who are 'sensitives,' will be inclined to agree with this view of the matter.

It has lately been suggested in France that the patients in hospitals who are suffering from infectious disorders might be placed in verbal communication with their friends at stated times by means of the telephone. The idea seems to be an excellent one, and would confer a privilege that would be much appreciated by both friends and patients. The expense would be trifling compared with the amount of happiness which a realisation of the scheme would bring about.

There will probably be a good deal of photography, both professional and amateur, going on at the Paris Exhibition, for the permission to take pictures is not to be sold as a monopoly to one firm, as is the case generally at Exhibitions. But certain stringent regulations must be complied with before a camera can be carried within the building or its grounds. The most important one is the payment of a fee of twenty francs for four hours' work. But a season ticket conferring the privilege of photographing during certain hours of each day during which the Exhibition is open can be purchased for three hundred francs. We publish these particulars because we have had one or two inquiries upon the subject.

The *American Machinist* recommends a convenient method of obtaining photographic records

of the patterns, or wooden models, used by iron-founders, so as to prevent them being lost sight of as they pass from hand to hand. A sheet of white paper is spread upon the floor, and upon it are arranged the separate patterns, each with a ticket bearing a number placed upon it. Above this paper is suspended a photographic camera, and a negative is produced. From this negative two prints are made, and while one is kept in the office, the other goes to the foundry. It is obvious that by quoting the numbers attached to the patterns in all future communications, mistakes would be impossible. The system is clearly applicable to many other trades.

Mr Neyer, of Ostritz (Germany), has patented in this country a method of preparing waterproof roofing which combines a chemical treatment of fibrous material with a dressing of tarry compound. The method of production is briefly as follows: The fabric of jute, flax, or other suitable material is first of all treated with tungstate of soda and ammonia sulphate in water, to make it incombustible. It is then dried and submitted to an asphaltting process, by being passed through a heated mixture of tar, asphalt, sulphur, and oil. The surplus of this mixture is now removed as the fabric is passed between iron rollers. It is next sanded, and the sand is incorporated with it in its passage between other rollers in its still warm and plastic condition. It is now cooled, and is ready for use.

A curious result of the high price to which copper has recently been run by speculators is seen in an important alteration which has taken place in the American Clock Industry. Most of the movements of these cheap and excellent time-keepers have hitherto been made of brass. But the price of brass being governed by that of copper, the compound metal became so dear that the manufacturers looked out for something cheaper. This they have found in soft sheet-steel, which, placed under the dies formerly used upon brass, gives excellent results. From this accident there is little doubt that most of the working parts of the cheaper kinds of clocks will be made of steel instead of brass, as heretofore.

An interesting paper on the 'Risk of Fire from Steam and Hot-water Pipes' was lately read by Mr A. D. Mackenzie before the Royal Scottish Society of Arts. Mr Mackenzie has made a number of experiments, as a result of which he is able to show that it is next to impossible to raise ordinary pipes used for heating purposes above five hundred degrees, and this heat he could only attain by hard firing and an additional load on the safety-valve. Most apparatus of the kind cannot be heated beyond four hundred degrees; and as paper, wood, cotton, &c., cannot be readily fired until the heat amounts to about double that figure, there seems to be less risk from hot-water pipes than was formerly believed to be the case. He put forward the theory that mice attracted by the warmth of the pipes would be apt to make their nests in close proximity to them, and these nests being of highly combustible material, might prove a source of danger from fire. We may assume, however, that the great proportion of mysterious fires which are not incendiary are due rather to overheated flues than to hot-water pipes. The latter are now considered such a necessary part

of even small houses, for the supply of baths, &c., that it is satisfactory to have an assurance that they are free from danger from fire.

White solid paraffin, which is now used so much for the manufacture of candles, is being made in Brazil from peat. The factory is at Marslin, where an immense deposit of peat more than one hundred and fifty feet in thickness is supplying the raw material. The industry is in the hands of a Company, and three hundred persons are at present employed on the works.

THE GREAT GUN 'PEACEMAKER.'

It is not perhaps known to the general public that in the early days of artillery improvements in the United States—nearly half a century ago—one of the first attempts to leave the beaten track and to construct a very large gun on a new principle was made by Commodore Stockton of the United States navy in 1842 and 1843; nor is it generally known why this gun was withdrawn and never heard of again. The reason is a sad one, and the story will now be told.

Commodore Stockton at the period named was in command of the *Princeton*, a fine man-of-war, and one of the first constructed with a screw propeller. Both propeller and gun were objects of great interest and much curiosity; so much so, indeed, that it was determined by the inventor of the gun to invite a party of about one hundred guests, including President Tyler, most of the cabinet ministers, a number of members of Congress, distinguished foreigners, and private friends, who were assembled on board the *Princeton* on the 28th of February 1844, then lying in the Upper Potomac river, to witness the working of the screw-propeller, and the firing of Commodore Stockton's newly invented wrought-iron gun the 'Peacemaker,' as it was satirically called. This gun carried a spherical shot weighing two hundred and twenty-five pounds, which was considered a prodigious advance on the long sixty-eight, which had held its own in the front rank up to that period. Commodore Stockton, the inventor and manufacturer of the new gun, was very proud of his novel idea, as placing him amongst the first leaders in the advanced movement for the improvement of the existing artillery. He was equally alive to the immense advantages of the new screw propeller, as giving complete command over the rapid movements of a ship in any required direction; and he had accordingly brought his ship to Washington to show what he had accomplished, and to exhibit some experiments before his assembled guests.

All being ready, the *Princeton* steamed away, passing slowly and grandly down the Potomac. The Marine Band was in attendance, the weather was splendid, and all went 'merry as a marriage bell.' When near Mount Vernon, luncheon was served. At the conclusion of the repast, everybody went on deck, all but President Tyler, who remained below to exchange some pleasantries with his affianced bride, Miss Gardner, her father, Colonel Gardner, having gone on deck with the rest. Commodore Stockton, Mr Gilmer, the Secretary of the navy, and Commodore Kennon took their stand on one side of the gun; Colonel Gardner, Mr Upshar, Secretary of State, and Colonel Maxey on the other; whilst Colonel Benton of

the Artillery went to the rear, in order to watch the exact course of the shot. The gun having been carefully trained and all being ready, Commodore Stockton gave the word to fire. A tremendous explosion followed, occasioned by the bursting of the gun into hundreds of fragments, which were scattered around with terrible force, spreading death and destruction on every side. On the smoke clearing away, a fearful spectacle presented itself. The space round the carriage of the gun was covered with dead and wounded. Mr Gilmer, Mr Upshur, and Commodore Kennon were struck by pieces of iron and instantly killed; and Colonel Maxey and Colonel Gardner also, by the extreme violence of the concussion produced by the explosion; whilst Commodore Stockton, Colonel Benton, and a member of the Senate named Phelps, were thrown prostrate upon the deck, deprived of consciousness, and very severely hurt; and many others were also badly wounded by flying fragments. Some of the killed were mutilated and disfigured by being struck in the face and breast by heavy pieces of the gun, and otherwise torn and injured. As nearly all the killed and wounded had wives or relatives on board, the scene of anguish and sorrow which followed this accident can be better imagined than described.

That the gun possessed great merits, and was constructed on sound principles, there can be no doubt; but it was clear that wrought-iron, with which it was made, was not strong or tough enough to bear the enormous strain put upon it by the explosion of a cartridge of powder sufficiently heavy to propel a shot weighing two hundred and twenty-five pounds. Subsequently, Captain Rodman's process came into use, by which guns are cast hollow on a core barrel filled with water, to assist the cooling; then Parrott followed, amongst other inventors of that period, with his huge and curiously shaped guns, which, from their singular resemblance, were irreverently called 'soda-water bottles.' As these were brought forward, they were quickly adopted, and readily employed in the United States navy.

The public were filled with dismay at the failure of this gun, from which so much had been expected, and also with infinite sorrow at the tragedy which had been enacted on board the *Princeton*, and the loss of so many valuable lives. Mr Gilmer and Mr Upshur were buried from the 'White House,' the President and most of the high state officials following the hearses with every mark of sincere respect and sorrow, the general public fully entering into and sharing these kindly feelings.

THE LOST ART OF WELDING COPPER.

The art of welding copper was well known to the ancients; but the secret by which two pieces of copper can be joined so as to present as perfect a union as that made in welding iron was by some accident lost, and many millions have since been spent in resuscitating it from oblivion. The lost art is stated to have been at last rediscovered by Mr James Burns, of Pittsburg. The economic value of the process lies in the fact that, even by the best methods now known to metallurgists, copper scrap cannot be economically utilised because of the difficulty in welding a mass of

pieces into one body. Mr Burns recently demonstrated before a critical audience that his process is not a mere sham. After flattening a rod of copper three-eighths of an inch in diameter, he formed a disconnected ring. The usual 'scarfing' process—forming a union by means of an oblique joint—followed; and then the operator, after sprinkling a certain powder over the piece, proceeded to make a weld which, when cooled, showed a perfect union. He next took the ring, which measured two inches in diameter, and submitted it to a strain until its longest width had been extended three-quarters of an inch, its shorter width being narrowed to a corresponding degree, a circle being thus changed into an ellipsis. This was a more severe test than iron is expected to stand, and demonstrated conclusively that the union of the two ends of the rod was not the mere 'brazing' of the coppersmith.

Mr Burns' discovery opens up a new field in working copper, and will in all probability cause great changes in some lines of manufacture. At present, to make a copper ring for fitting over a joint, or making a gasket or joint, it had to be cut round out of a solid plate, causing great waste. To repair broken or defective pipes, brass had to be used; and should an intense heat strike the brazed part afterwards, the brass would melt and ruin the piece. But by the Burns process the economic use of copper is assured, and copper scrap, now worth but one-third its weight of new copper, would be as high in value as ingot copper. It is said that the ingredients which form the powder used by Mr Burns in welding are very cheap.

A SUMMER SONNET.

It is the Summer-time; sweet odours rife
From flower-lips, breathing fragrance, fill the air,
For Earth's great heart is warm with rich, full life,
And golden sunshine lingers everywhere.
Bright blossoms crown the mountain's rugged brow,
And happy birds make glad the verdant wood,
Where, tinkling low 'neath overhanging bough,
A brooklet seems to murmur, 'God is good.'
Fair roses blush, as wooing breezes pass,
And roscate clouds wait on the radiant morn;
While, from her lowly home amid the grass,
The lark soars far above the ripening corn,
Singing her Maker's praise in strains sublime.
Sing too, sad heart; it is the Summer-time!

R. MATHESON.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

A DREAM IN SUMMER-TIME.

'NOBODY is in town,' says the fashionable world. But we, my literary chum and I, are not of that world; we belong to the three million and odd Nobodies who people at all seasons of the year the now so-called empty streets of London. The blinds may be down in Mayfair, Belgravia may be a howling wilderness given over to grimalkins and charwomen, even the sober regions of Portland Place and Harley Street may have only 'the Master' at home—notwithstanding this, in Kensington Gardens, on a dreamy August afternoon, there are plenty of children pelting one another with the fallen leaves, or sailing boats on the broad pond; plenty of loungers in twos and threes, who seem to find the world quite full enough for comfort and happiness; plenty, too, of lonely folk, who look as if 'the season' made small difference to them one way or the other. And these are all Nobodies! We are quite content to form a part of this negative population, and stroll on over the rustling carpet of leaves through the long straight avenues in search of some quiet shady nook in which to lounge and dream.

Through the branches comes soft summer sunshine, lighting up the greenness, until one could almost fancy that the year were young, and had just donned its spring mantle, so tender is the colouring among the tree-tops. Who first planned these wonderful avenues? and how many years is it since they were but lines of small saplings, swayed by every breath of wind? Now, they tower around us in their magnificent strength, and seem to mock the puny lives of 'poor humanity.' But a winter's blast or a summer storm could shatter their greatness in a moment; humanity lives on through the ages, ever rising, ever expanding, until, perchance, at last there shall come that perfection which— But metaphysics leads us to stone walls, and stone walls break heads, so we will come back into the sleepy sunshine of this everyday world.

When we reach the old Palace, it is quiet enough for the most devoted lover of solitude. We throw crumbs for the pert sparrows that are fluttering happily about careless of our invasion. The news spreads quickly of the feast provided, for in ten minutes numbers are hopping on the pathway in front of our seat, or quarrelling with their neighbours who have secured an unjustifiable share of the spoil.

How pleasant it is to get out of the dust and noise into this peaceful quietness! Yet people will tell you in perfect good faith, if you desire rest, that you must straightway convey yourself to the Sahara or Greenland, or some other spot equally inaccessible and uninviting, for that nothing in the way of repose can be found except in such desolate regions. Other persons less ambitious, but equally unpractical, will say: 'Take a holiday; have a run abroad. Nothing like a thorough change, you know, for setting you up.' And the unfortunate wretch who has perhaps but five shillings to spare for 'a holiday,' sighs over the well-meant advice and turns back hopelessly to his work. He cannot stand 'excursions' with their necessary row and hurry, and the five shillings would not take him out of town from even Saturday to Monday. So he grinds on, quite unconscious that he could find 'bits'—to use a painter's term—in these London parks of ours which are as resting and quiet as any solitude in the world. He could not get grandeur or perhaps perfect stillness; but there is enough of beauty; and the 'roar of London,' mellowed by distance, resembles but the humming of a swarm of bees or the murmur of far-off waves.

We leave our sparrow friends and saunter round to get a better view of the Palace. It looks very sleepy and decayed. The sunshine shows up its smoky stucco urns, and suggests that nobody takes much interest in its well-being. Somehow, as we lean on the iron railings and look across the smooth lawn with its bright flower-beds, it seems as if the old place had died with its former greatness and wanted burying. Even the empty sentry-box has a desolate air. Is it our imagina-

tion, I wonder, which always gives an appearance of decay to a place that has come down in the world? The lawn may be trim, the flowers gay, the windows shining; and yet there is a stillness that is not of life; it is difficult to fancy that people still are born and marry and die within its walls.

Suddenly the sun shines out brightly: free from its accustomed veil of smoke, the face of the Palace sparkles—it has grown young; the flower-beds are turned from 'ribbon-borders' into 'patch-work;' the trees have transformed themselves into peacocks, teapots, and all the odd shapes that adorn a correct 'Dutch garden.' And who are these quaint figures that have stepped out from the portrait-frames to promenade among the pleached alleys or over the smooth bowling-green before attending their royal mistress at supper in the great conservatory? Is not that the model waiting-woman, Mistress Abigail Hill, flirting with her future husband, and anon casting envious glances at her kinswoman whom she is so soon to rival, the haughty Sarah of Marlborough? That, surely, is the 'handsome Englishman, Malbrook' himself, who stands aside, listening with deaf ears to the gossip of Dr Trimmel as he angles for that bishopric which is not to be his just yet. The great Duke has something else to think about: his manor of Woodstock, with its fair mansion Blenheim; the municipal and official honours poured upon him; the thanks of a grateful nation for his many 'famous victories.' No thought of coming evil crosses his mind as he sees Mistress Abigail pounce upon Mr Speaker Harley, who has just arrived, and draw him into long and mysterious converse. And yet, not long hence, Marlborough and his haughty Duchess will be crashing to their fall, amid the bitter sneers of Robert Harley, Earl of Oxford, and Henry St John, Viscount Bolingbroke, the latter of whom is at this moment forgetting his state cares in a hot literary discussion with Mr Joseph Addison. This last has not as yet given the *Spectator* to the world, neither has he commenced his unhappy married life at Holland House hard by, concerning which it has been well said: 'Holland House is a large mansion, but it could not contain Mr Addison, the Countess of Warwick, and one guest, Peace.' But Mr Addison has just quarrelled with Dean Swift, and the great satirist's latest pamphlet is being severely handled in consequence by his quondam friend, who observes, in the course of conversation, that—

'Harry, my dear fellow, are you asleep? It is just six o'clock, and I have an article to finish for the *Scratcher*, and to review that idiot Smith's book on "Lunatic Asylums" and heaps of things besides.—Come home, old boy, come home. I'll bet a fiver you contemplate founding an Asylum—'or Decayed Vegetables—and intend taking that old greenhouse yonder as a model.—You'll never turn your mooning dreams into L. S. D.'

And my literary friend, who, in spite of his wild hair and general bohemianism, is much more alive to the prosaic facts of every-day life than my starched-looking self, hurries me off remorselessly to ignoble tea and chops in our distant Bloomsbury lodgings.

As we tramp homewards, my thoughts linger over the quaint vision which the sight of Queen Anne's Conservatory, built originally for a Ban-

queting Hall, and frequently used by Her Majesty as such, had called up; and I register a mental vow that, while my friend is making mince-meat of some unhappy rival in the *Scratcher*, I also will for once improve the shining-lamp-lit-hour, and turn my 'mooning dream' into a study in black and white.

JOHN VALE'S GUARDIAN.

By DAVID CHRISTIE MURRAY,

Author of 'VAL STRANOE,' 'JOSEPH'S COAT,' 'RAINBOW GOLD,' etc.

CHAPTER XXVIII.

PRESTO! A change from the yellowing lanes and whitening wheat-fields of late summer to a glistening field of snow. Trees and hedges bare of foliage, but sparkling thick with rime after a night of frost and fog. Snelling sat in his own room chafing his knees before a great coal-fire and staring into the shapes that formed there. One of the chance-presented faces bore a grotesque likeness to Tobias Orme; and Snelling, after glaring at it wrathfully for a second or two, took up the poker and demolished it with as much gusto as if it had been a living bugbear. Snelling knew by this time, what was known to the whole country-side, that the wretched Tobias had betrayed the secret he had meant to keep, and instead of enriching his patron and himself, had enriched the rightful owner of the land on which his precious discovery had been made. Within reach of Snelling's hand lay a letter; and when he had destroyed Mr Orme's imagined likeness, he took up this missive with an angry fretful jerk and glanced over it contemptuously. It was written in a somewhat shaky handwriting, which had once been clerky, and a good deal over-informed with flourishes, and it was couched in the most involved and polysyllabic phrases the writer could discover. It came from Mr Orme himself, and perhaps that fact had helped Snelling to identify his correspondent's inflamed countenance in the glowing coal. The letter announced the writer's approaching arrival.

'Plunged,' wrote Tobias, 'from the loftiest pinnacle of hope into the profoundest abyss of poverty, scarcely able to predict at the moment of time at which I indite these despairing lines by what providential opportunity I shall succeed in acquiring the wherewithal whereby to secure the necessary Queen's-head for its despatch, I venture, sir, with all fitting respect, but at the same time with all the energy of which language is capable, to beseech you to recall from memory the promise made in happier days. In the hope, sir, that that promise has not utterly escaped from your remembrance, I shall venture to present myself to-morrow morning at the hour of eleven, as near as I can make it, at your door—a door, alas! once hospitable, a door to which I have twice borne tidings of the utmost importance to its owner, but a door at which, I fear, I can no longer look forward to that warmth of welcome to which I once fondly dreamed that I might have a perpetual authority to aspire.'

Snelling was not an English stylist, and in spite of his bitter grudge against Tobias, a mournful admiration touched him. He knew for his own part that he might as well have tried to

fly as to write that letter. 'That's where drink can carry a man of learning,' he said half aloud, as Mr Orme's sordid figure and soddenn countenance presented themselves to his memory. 'Why, with a power of expression such as that man's got, he might ha' been anywhere at his time o' life if he'd only kept himself sober. I reckon I shall have to see him when he comes; but he's been bitter harm instead o' good to me, and he'll have to suffer for it. If he'd ha' kept his tongue betwixt his teeth, he'd ha' been a rich man this minute.' He turned and struck a bell which lay upon the table. 'Mrs Wilkins,' he said to the housekeeper who silently answered the summons, 'I'm expecting a person of the name of Orme. He's been here before, and you'll know him when you see him. He's pretty shabby, I reckon, but you'll show him in when he comes.'

He had not long to wait, for the housekeeper had scarcely retired a minute when she returned and tapped at the door: 'The person you expected, sir.'

Snelling wheeled slowly round and took stock of his visitor mercilessly from head to foot. The wretched Tobias wore boots that gaped; his coat was out at the elbows, and his trousers were broken at the knees. He had some dreadful kind of black stuff, grayed with dirt, wound about his neck and stuffed into the bosom of his waistcoat. The toper's glow had faded from his nose, the tinge of which had deepened under the winter cold to a pinched purple. He dangled in one hand a wretched relic of a hat, and looked altogether so piteous, that Snelling, who had fully made up his mind to give him nothing, could afford to be compassionate.

'You've brought your pigs to a pretty market,' he said, with well-fed, well-warmed complacency. 'You're better than a sermon agen drink, you are. This is what you've come to.'

'Yes, sir,' answered the wrecked Tobias, 'this is what I've come to.' He took a terrible old red handkerchief out of his hat and wiped his eyes with it. They were watering, half with cold and half with his inward spirituous pathos. 'You can hardly find it in your heart, sir, to be hard upon a man like me.' Here Mr Orme's knowledge of human nature at large, and of Robert Snelling in particular, failed him. It was precisely upon a man like him that Snelling could find it in his heart to be hardest.

'You said you'd come,' Snelling answered, 'and here you are. I wouldn't say I wouldn't see you, for I'm a man as likes to do things straightforward and above-board. If you think you've got anything in the natur' of a claim on me, let's have it in plain words. I made a bargain with you to give you two per cent. on the profits of the news you brought me last summer-time. Where are the profits? If I was to claim two per cent. on the losses up to this minute, you wouldn't fetch the money if you was rendered down and sold.'

'The losses, sir?' asked poor Tobias. 'I hope, sir, that I have led you to no losses.'

'It matters very little what you hope, my man,' returned Snelling, contemptuously dignified. 'It matters very little whether you hope at all, or whether you don't hope at all. D'ye know what your confounded news has cost me? Up to date, not a penny under seventeen hundred and fifty pounds. Whether I shall ever see a penny on

it again is more than I can tell, and more than any man can tell me.'

'But there's coal, sir,' cried Tobias; 'there's coal everywhere.'

'Yes,' said Snelling, nodding at him in a chill anger; 'there's coal everywhere, maybe. That ain't the question, my man—that ain't the question. There's coal there, like enough, but there's sand on top of it.'

'Sand, sir?' asked Tobias, meekly and feebly.

'Yes, sand—a dry, live sand as runs like water. You might as well try to dig a hole in a horsepond as sink through it. They're making a try to fathom it this very day; but for all I know, it runs down to the bowels of the earth. That's what your discovery has done for me, my man. It's landed me on a job as might break Rothschild. If you'd kept sober and brought me the news you could ha' brought me twenty hours earlier, you might ha' been riding in your own trap by now, like my man Isaiah.'

This intelligence seemed mentally to annihilate Mr Orme for the time being; he stared piteously straight forward, shivering a little with cold, but saying nothing, and except for his utterly dazed look, giving no sign that he felt anything. But in a while he began to whimper, his under lip protruded little by little, and his tears began to flow.

'Look here,' cried Snelling, on whom a display of this kind could be expected to produce but one effect, 'if you want to shed tears, go and shed 'em outside, where it don't matter. I won't have you crying over my new carpet.'

'O sir,' cried Tobias, roused once more to a knowledge of himself by his patron's voice, 'you can't expect to prosper if you leave me to starve.'

'Can't I?' said Snelling gruffly. 'I'll chance that, my man.'

'You can't! you can't!' Tobias moaned. 'I am the Columbus of this America, Mr Snelling. Nobody will ever do any good with my discovery if I am left to starve; I know they won't; I'm sure of it.'

Now, this view of things was natural enough from Tobias's standpoint, but less natural from Snelling's; and yet it struck the latter with an oddly superstitious feeling.

'I'll tell you what I'll do with you,' he said. 'You've got no more claim on me than I should have if I was to go to Barfield Hall and ask my lord for his title. But if you'll undertake to keep away and niver to bother me any more, I'll make a bargain with you. Provided I get news as this sand can be passed through, I'll give you a ten-pound note; and if it isn't passed through, I shall give you nothing. You've got no more claim to that ten-pound note than you've got on the clothes I'm wearing; but I'll do that much for you. In the meantime, you can sit i' the back kitchen and have a bite and a sup theer, and I'll give my housekeeper orders to see to you at once. That's the last you've got to look to, and that ain't certain, nor can't be for some hours to come.'

'If you would be so extremely good, sir,' said Tobias, 'as to allow me to wait and see—'

'You can sit i' the back kitchen if you like,' said Snelling; 'you'll be in nobody's way there, and you'll have a bit of a fire to sit by.' With that he rang the bell and gave pompous orders for the bestowal of his miserable guest.

It was out of no pity for Mr Orme's discomforts or disappointments that he did this; it was a kind of sop to circumstance or bid to fortune. Snelling would have scorned the open statement that there was any such thing in the world as that blind foolish deity of luck whom in his soul he desired to propitiate. A man's genuine belief is not by any means that of which he is logically persuaded. The absurd and unreasonable fancies which move him to action are beliefs more settled and profound than the most cherished dogmas which leave him inactive. So Snelling believed that the foolish deity might diminish or increase the obstacle which lay between him and his hope in accordance with his treatment of Tobias. It was like the gambler's consultation of the cards before the game, likelier than not to have its predictions falsified, and yet none the less to be regarded with hope and fear.

He had an appointment that day with Proctor, the renowned engineer, who had been called in to determine whether or not it were worth while to continue the operations. If the verdict went against him, it meant a clean loss of at least a thousand pounds. He had exaggerated things in talking to Tobias, and felt as if he were justified in setting off the figures of great sums against the background of that unfortunate's poverty. If the verdict went in his favour, he was no longer merely a man of solid substance but a man of wealth. He had no need for wealth, and knew as little as any man alive how to put it to any uses profitable to himself; and yet he yearned and burned and thirsted for it. The student of human nature finds himself confronted by many difficult problems, but there are not many of them so puzzling as that presented by the love of money for mere money's sake. Snelling did not propose to himself to do anything with his prospective riches, even to live better or lie softer. It would have been hard to exaggerate or increase by any amount of wealth his sense of personal importance and majesty, and except that he intended generally to make money breed money, he had no designs at all respecting it. And all the same he coveted it, as a saint longs after virtue, or a repentant sinner after forgiveness, or a young artist when he thinks of fame, or a lover who looks forward to his union with his sweetheart. There is nothing desired of men which creates or can create a more preoccupying longing for possession than money excited in his mind.

In due time he mounted and rode away towards the shaft at the bottom of which his hopes lay hidden in darkness. In the neighbourhood of Beacon-Hargate the whole country undulates gently into hill and vale, but the Beacon itself tops everything, and from its summit on a clear day there is an uninterrupted view of at least a dozen miles on any side. Snelling's road led him past its crest, and when he had reached the summit he paused for a moment and looked round on the familiar landscape. The discovery of the earth's hidden treasures had as yet done but little to alter its character, and the broad field of snow almost obliterated even these signs of change. Half-a-dozen pit stacks and an engine-house were in course of construction; but the hard winter weather had stopped the work, and they stood tranquil, with no signs of life about them. Day's farmhouse had vanished from the landscape, to

be sure; and near where it had used to stand, the furnace fires of the new engine sent up a column of smoke, and the panting of the engine itself throbbed faintly audible on the quiet country air. Gazing in that direction, Snelling half regretted his engagement with Orme. He would have given something to have been first in the field, and much to have gone swaggering with the proclamation that he was the first to have recognised the riches of the district. It was Tobias's folly which had robbed him of that splendid chance. Yet he dared not altogether be wroth with him just then, lest the foolish genius he courted should choose not to be propitious. He stifled his anger and rode on.

His own shaft lay at the foot of the Beacon Hill, and within two hundred yards or so of the local line of railway. As he trotted towards it, the engine began to pant and the wheel over the shaft to revolve, and thinking that somebody might be coming to the bank with news at that moment, he shook his reins and hurried onward. There were two or three loungers at the side of the shaft warming their hands at the fire heaped in an iron brazier made by the simple expedient of punching an old bucket full of holes.

'Any news?' Snelling asked as he dismounted.

'Mr Proctor's down, sir,' one of the men responded. 'One of the chaps was up just now. It seems the soundin'-rods was forgot, sir. Better leave the hoss inside, if you mean to wait, sir.'

There was a raw desolate hovel built for shelter, constructed of all manner of odds and ends, and into this Snelling led his horse. There were one or two clumsy stools overturned on the floor of beaten earth, and against one wall a primitive fireplace had been erected. The fire which lay in it filled the rough-cast room with smoke, and Snelling banged the door angrily open before he sat down. He waited for half an hour, and at the end of that time his impatience mastered him.

'Let Mr Proctor know I'm here,' he called; and the fire by this time burning clearly, he drew up to it and fell to brooding. The great mining engineer's entrance awoke him from his thoughts. There had been a misunderstanding, Proctor said. The man instructed to bring the sounding-rods had not obeyed his orders. A messenger had been despatched for them, and might be ready at any minute.

'Look here,' said Snelling, 'I've got other business than this to see to. Give me a Yes or No as soon as you can, if you please.'

'My dear-r sir-r,' the engineer responded, 'I can tell ye nothing till I get the sounding-rods. Then I'll let you know in an hour. In the meantime I've a bit o' business with Messrs Day and Winter. I'm due there in half an hour, and I must get away.'

'My affairs,' said Snelling surlily, 'are about as pressing as Messrs Day and Winter's.'

'Ay, ay, sir!' said the man of science. 'To you, sir, but not to them.' He buttoned up his overcoat and bustled cheerily from the place.

Snelling was left alone with his anxieties for an hour, and at the end of that time a messenger came to say that an accident had happened to the sounding-rods, by which they had been twisted. It would take three or four hours to put them into working order. The anxious man arose in wrath,

and an oath escaped him. He had not been guilty of such a falling-off from respectability for a score of years past; but his nerves, tough and dull as they were, were at a terrible tension. He sat torn between the dread of heavy loss and the expectation of unmeasured gain, and his suspense was almost unendurable. He went outside the hut and tramped up and down, up and down, up and down, wearing a long track in the otherwise unsoiled snow of a neighbouring meadow.

The engineer came back again, and they waited together; and Snelling, too proud to display his anxiety further, sat down in slow torment and scarcely spoke a word for hours. One of the men brought them some coarse food, and the engineer, accustomed to rough fare, attacked it cheerfully; but Snelling waved it voicelessly away.

At long last, as the winter dusk was falling, two men came down the road bearing a dozen lengths of jingling iron on their shoulders.

'Here they are,' cried Proctor; 'and now we'll know in a jiffy.' He made ready to descend.

Snelling felt that he could not bear to look on the slow work of preparation. He shut himself resolutely indoors and stared at the glowing coals. The hungry horse clamped at his bit and now and then gave a rattling shiver. Voices from outside told how the preliminary work was going on. Then the engine throbbed for a little while, and there was silence.

The next half-hour was an agony of covetousness and foreseen failure, but the man sat in the dark like a statue.

'If it's all a mistake and the money's lost,' he told himself, 'they shall see no sign in me.'

The engine got to work again and paused again; and Proctor, bearing a lamp, shouldered abruptly into the hut.

'Well?' said Snelling without turning.

'We've proved five-and-twenty fathom sand,' said the Scot; 'and I should just counsel ye to give it up and sink elsewhere. Ye might drop all ye've got into that hole and never see a penny of it.'

After all, Snelling was not without heroism in his way; he reared his great bulk and settled his coat about him. 'If that's so, it's so,' he said quietly. 'Good-night to you.' He shook hands, led out his horse, and mounted. There was a snow-light in the air, but otherwise the night was dark, without a star. He rode calmly enough for a while; but by-and-by his head and shoulders began to droop, and the horse, falling into a foot-pace, jogged on wearily, as if his master's depression touched him, as perhaps it did. Nearing the top of the Beacon, Snelling heard a wild clatter of hoofs before him beyond the ridge of the hill. He glanced up, and beheld the sky was ruddy. Even whilst he stared at it, a figure came galloping wildly over the crest, black against the wild glare of the sky.

'Look out!' roared Snelling. 'Where are you coming to?'

The rider pulled up with difficulty, and cried out in a breathless voice to him if that were Mr Snelling.

'Yes,' cried Snelling with a fierce foreboding. 'What's the matter?'

'The house is afire, sir. A lamp burst in your nephew's bedroom. Mrs Wilkins heard the crash, but she couldn't go in: the place was swimming

with fire. There's nothing will save the house, sir, and we can't find Master John nowheer.'

He heard the news without a word, and rode on. Was it possible that fortune had at last so far befriended him?

EPIDEMICS PAST AND PRESENT.

THE late epidemic of Yellow Fever at Jacksonville, on the Atlantic coast of Florida, caused considerable consternation on the other side of the water, and attracted special attention on this side owing to the well-known scientist, Mr R. A. Proctor, having fallen its victim. It is a terrible scourge to the tropical and subtropical regions of America, which are hardly ever entirely free from it, though it rages with special violence only at intervals. Its area, however, tends to become more circumscribed. It used to be common in all the eastern harbours of the United States as far north as Rhode Island; but during the present century it has rarely got north of Charleston except in connection with arrivals from southern latitudes. Its ravages have at times even extended to Europe. During the first twenty years of the present century there were constant and mysterious outbreaks of the epidemic in the principal Spanish ports, and year after year the southern and eastern coast towns of Spain suffered heavily. The last outbreak was in Barcelona in 1821; and since that date the country has practically been free from the scourge, though Lisbon had a serious visitation in 1857, when six thousand persons of all grades of society perished in a few weeks. Yellow fever has rarely visited England, though in 1865 an outbreak occurred at Swansea which was fatal to twenty persons.

The origin of the disease is by no means certain; but it had evidently a close connection with the slave-trade in the first instance, as all its best known seats in America correspond very closely with the ports at which slave-cargoes were landed. That yellow fever is not of African origin is clear; the disease is unknown on the Continent, except in connection with returning ships; and even in America it rarely attacks pure-blooded negroes.

The theory which at present finds most acceptance is that the disease began by the filth of slave-ships being discharged in the American harbours at the end of their voyages, where it fermented in the banks of mud, and spread poisonous germs through the air. Yellow fever is specially associated with seaports, and particularly with the lowest or most alluvial parts of them, and it rarely appears any distance inland. It is a contagious and malignant disease, often attended with a peculiar yellowness of the skin, a fact which gave rise to the name by which it is known. It attacks its victims very suddenly, the first symptoms being weakness and restlessness, speedily followed by faintness, giddiness, and chills. The crisis generally occurs within twenty-four hours of the first seizure, and the young and robust are particularly liable to be carried off by it. Much doubt still exists as to the nature of the contagion, some authorities considering it to be only conveyed by personal infection; while others hold it to be spread by

malarial influences, without direct or indirect contact with a previous sufferer.

Another epidemic, of which we have, unfortunately, had wider and more recent experience in this country, is that of Smallpox. Though this disease does not now commit such fearful ravages as it did in times past, it still remains one of the most serious febrile complaints, and while probably more contagious than any kindred disease, the nature of the contagion is not yet clearly ascertained. It is now pretty generally accepted that smallpox is propagated from germs carried in the air; but of what these germs consist and how they act we have no certain knowledge. Close contact with sufferers will convey the infection, and so will their clothing, even after weeks and months have elapsed; but it seems very probable that the disease is extensively propagated by means much more obscure and indirect. The medical books report a case from America in which germs crossed a river five hundred yards wide, and infected a number of carpenters working on the other side; and cases frequently occur in which it is impossible to trace the manner in which the infection is carried.

The history of the disease is also involved in considerable obscurity. It is believed to have originated in Asia, and was first noticed as a distinct complaint by Procopius towards the end of the sixth century; but the oldest accurate description of it which we possess is that given by Rhazes, an Arabian physician, who wrote in the tenth century. The contact with Asiatics occasioned by the crusades seems to have spread smallpox widely over Europe, and this country suffered from it very severely, especially during the thirteenth century. In 1517 it first appeared in America, where it committed frightful ravages. Like other contagious diseases, it seems most fatal when introduced among populations for the first time. Prescott estimates that in Mexico alone it destroyed three and a quarter million inhabitants; and in Brazil it extirpated whole tribes. In North America it was equally virulent; Mr Catlin in his work on the North American Indians speaks of six million red men being carried off by the hideous plague. The Duke of Argyll in his recent work on Scotland gives records of the terrible ravages it committed in that country in the seventeenth century, when the epidemic spared neither high nor low. It was particularly fatal to English royal personages about this time; William III. nearly died of it, and it proved fatal to his consort Queen Mary, to his uncle the Duke of Gloucester, and to the eldest son and youngest daughter of his predecessor, James II. The introduction of inoculation, and afterwards of vaccination, combined with the gradual importance of sanitary conditions, have considerably reduced its ravages, though the recent outbreaks at Sheffield and elsewhere show it to be still a serious evil.

We may, however, congratulate ourselves on being free from many of the epidemics from which our forefathers suffered; such terrible scourges as the Black Death, the Sweating Sickness, and the Plague, we now know only by name. The first of these is believed to have originated in China, and took its name from the dark spots which usually appeared on the person

of the sufferer. These spots were symptomatic of putrid decomposition, and their appearance was nearly always a fatal sign. Beginning with inflammatory boils and tumours, the Black Death produced stupor, mental affections, and palsy of the tongue, the last generally becoming black, as if suffused with blood. The characteristics of the disease were burning, unslakeable thirst, pains in the chest, spitting of blood, and fetid breath. This pestilence attacked Europe in a mild form in 1342, and may be traced as moving in the wake of the numerous caravan routes from the East. Spreading from the north coast of the Black Sea to Constantinople, and from thence to Italy, it radiated from there by many routes over the whole of Europe. Wherever it appeared it committed such fearful ravages as materially to check the increase of population; in China the deaths from this disease were estimated at thirteen million, and the rest of the East lost nearly twenty-four million; whilst a moderate calculation puts the loss in Europe at twenty-five million. London and Venice lost 100,000 inhabitants each; and Paris, Florence, and Norwich half that number apiece. It caused so serious a decrease of population in this country for a time as to create a great dearth of workmen and labourers; and in consequence, a great rise in wages. Professor Thorold Rogers, who has investigated the economic bearings of this disease very thoroughly, states that the working-classes were at no time so well off in England as during the period which immediately followed the ravages of the Black Death in the fourteenth century. It is never known to have made its appearance since then.

A century later this country was attacked by another serious epidemic, the Sweating Sickness, which was so called because, in the words of an old writer, 'it did most stand in sweating from beginning to ending.' It first made its appearance in England, and was generally known on the Continent as the 'English sweat.' It was observed generally to spare foreigners in this country, and also to be specially fatal to Englishmen when it appeared abroad; and it was surmised that the immoderate use of beer, then so common in England, rendered its inhabitants particularly susceptible to the disease. Beginning in 1485, in the army of Richmond, afterwards Henry VII., it spread quickly over the country with most fatal results. It seems to have been a species of violently inflammatory fever, which suffused the whole body with a fetid perspiration, the crisis generally occurring within twenty-four hours of the first seizure. Like most other epidemics, it was specially fatal to healthy, vigorous men in the prime of life, and hardly one per cent. of such recovered. In London, where it raged with peculiar violence, two lord mayors and six aldermen died in one week. This first outbreak continued its ravages until the end of the year, its cessation being nearly coincident with a violent tempest on New Year's day 1486, which was therefore supposed to have caused its disappearance. Further outbreaks of this epidemic occurred in England in 1506 and 1517, when again London suffered severely; and in 1528 and 1529 not only this country, but also France and Germany, and, in a less degree, Holland, Sweden, and Poland, were visited by

the same pestilence. The last appearance of the Sweating Sickness in England was in 1551, when the disease was particularly virulent in Shrewsbury and the valley of the Severn.

The Great Plague, which attacked Europe at intervals during the fifteenth, sixteenth, and seventeenth centuries, was a very contagious kind of malignant fever, probably nearly akin to what is now known as typhus, and was characterised by swellings of the lymphatic glands, purple spots, and carbuncles. It was a popular belief that persons who had survived one attack of the disease were not liable to another; but that this was quite groundless is proved by well-authenticated cases of individuals taking the infection several times. The first signs of pestilence were shivering, sickness, giddiness, and pains in the loins, accompanied by a feeling of intense weariness; in the second stage the tongue became dry and brown, the gums, teeth, and lips were covered with a dark fur, and livid patches and dark stripes made their appearance on the skin. In fatal cases, the pulse gradually sank, the surface of the body became clammy, and coma or low delirium set in, death usually occurring within five or six days of the first seizure. This disease has always been confined to temperate regions, and has been most fatal in summer and autumn, especially during the month of September. That it is largely due to dirty habits and bad sanitary arrangements is evident from the fact that its greatest ravages were in close, ill-drained towns: as sanitation has progressed the Plague has receded. Its last and most fatal outbreak in this country was in 1665, when London suffered so severely that business was practically at a stand-still. Every street, and in some cases every house in the street, was attacked, and more than twenty-six thousand died in the month of September alone; while the total loss cannot have been far short of one hundred thousand persons. For such large numbers, ordinary burial was impossible, and the dead had to be carted away coffinless and thrown into vast pits dug beyond the then existing walls. In 1720 the Plague destroyed nearly half the population of Marseilles; and seventy years later it raged with great virulence in Russia and Poland. Since that date, however, it has never visited Western Europe, though it still appears in Greece and Turkey, and occasionally in Russia.

UNDER AN AFRIC SUN.

A NOVELETTE.

By GEORGE MANVILLE FENN.

CHAPTER I.

'WELL, 'pon my word, Fraser!'

'What's the matter now?'

'I'm staggered; I am, really.'

'What about, boy?'

'To think I could be such an absolute noodle as to let you morally bind me hand and foot and bear me off into a desolate island in the Atlantic, to carry your confounded specimens; be dragged out of bed at unholy hours to walk hundreds of miles in the briling sun; to sleep in beds full of the active and nameless insect abhorred by the

British housewife; and generally become your white nigger, cad, carthorse, and'—

'Have you nearly done?' said Horace Fraser, with a grim smile upon his dry quaint countenance.

'No; that was only the preface.'

'Then let's have the rest when we get home in the shape of a neatly printed book, a copy of which you can present to me with a paper-knife of white ivory; and I promise you I will never cut a leaf or read a line.'

'Thanks, Diogenes.'

'Diogenes indeed!' cried Fraser with a snort, as his crisp hair seemed to stand on end. 'Now, look, Tom Digby; you are about the most ill-conditioned, ungrateful, dissatisfied English cub that ever breathed.'

'Go it!' said the good-looking young fellow addressed, as he flung himself down among the ferns and began to untie his shoes, after wiping his steaming brow and taking off his straw hat, to let the hot dry breeze blow through his crisp wavy brown hair.

'I mean to "go it," as you so coarsely term it, sir,' continued Fraser, crossing his arms on a roughly made alpenstock. 'I came to you in your black and grimy chambers, where you were suffering from a soot-engendered cold. I said: "I am off to the Canaries for a three months' trip. Leave this miserable London March weather, and I'll take you where you can see the sun shine."'

'See it shine? Yes; but you didn't say a word about feeling it,' cried the younger man. 'Do you know the skin is peeling off my nose, and that the back of my neck is burnt?'

'Don't be a donkey, Tom! I ask, did you ever see anything so lovely before in your life?'

'Humph! 'Tis rather pretty,' grumbled the younger man.

'Pretty!' echoed Fraser contemptuously, as he took off his hat, as if out of respect to Nature, and gazed around him at sea, sky, mountain, and hill, whose hues were dazzling in their rich colours. He then threw down his alpenstock, drew a large geological hammer from his belt, and seated himself upon the grass, while his companion brought out a cold chicken, some dark bread, and a number of hard-boiled eggs, finishing off with a bottle and silver cup.

'Look at that wonderful film of cloud floating toward the volcano, Tom! Look at the sun gleaming upon it! Just like a silver veil which the queen of mountains is about to throw over her head.'

'Poetry, by jingo!' cried Digby. 'Brayvo old stones and bones, I say! Look at the golden yellow of the hard yolk lying within the ivory walls of this hard-boiled egg; and at the— There; I'll be hanged if I didn't forget to bring some salt!'

Tom Digby made a sound with his tongue as he tasted some of the wine he had poured into the cup; then he made a grimace.

'I say, Horace, old chap, it was all very well for the old people to make a fuss about their sack and canary; but for my part a tankard of honest

English beer is worth an ocean of this miserable juice.'

'Don't drink it, then,' said Fraser, eating mechanically, as he gazed about him at the glorious pines around, and then down at the tropical foliage of banana, palm, orange, and lime, two thousand feet below, where it glorified the lovely valleys and gorges which ran from the black volcanic sandy shore right up into the mountains.

Then a silence fell upon the scene, which continued till the *al fresco* repast was at an end, and Tom Digby deliberately lit up and began to smoke.

'What an enthusiastic young gusher you are, Horace!' cried Digby banteringly. 'For a man of forty-one, you do rather go it.'

'And for one of twenty-five, you assume the airs of a boy,' said Fraser grimly.

'Well, I feel like one, old chap, out here. Why, it's glorious to breathe this delicious mountain air, to gaze upon the clouds above, and below at that wonderful blue sea, and at the yellow pines which look like gold. Yes,' he added, as he sprang up and gazed about him, 'it is a perfect Eden! What a jolly shame that it should belong to the Spaniards instead of us.'

'I daresay they appreciate it.'

'Must have done, or else they wouldn't have taken it from the—the—the—what did you call the aborigines?'

'Guanches.'

'What a chap you are, Horace! You seem to know a bit of everything.'

'I only try to go about with my eyes open, and take interest in something better than colouring a meerschaum pipe.'

'Severe!'

'Well, you do annoy me, Tom, you do indeed. A man with such capabilities, and you will not use them. Why, you haven't even tried to learn Spanish yet.'

'What's the good? You know plenty for both. I'm well enough off not to bother my brains about Spanish.'

'Ah, Tom, Tom! if you only had some aim in life.'

'Rather have some of those delicious oranges.'

'Eating again?'

'No, for drinking. Thirsty land, Horace, and I never knew what an orange really was before. And why should I worry myself about languages? I've a lively recollection of your namesake at school, and Virgil and Homer and all the other dead-language buffers.—I say, though, that's fine.'

They had come suddenly upon one of the gashes in the island known to the Spanish as *barranco*—a thorough crack or crevice in the rocky soil, with perpendicular sides clothed with mosses, ferns, and the various growths which found a home in the disintegrating lava of which the place was composed. Here the various patches of green were of the most brilliant tints, and kept ever verdant by the moisture trickling down from above.

'Mind what you are doing!' said Fraser, after stooping to chip off a fragment of perfectly black lava from a bare spot.

'Yes; it would be an awkward tumble,' said Digby, as he leaned forward and peered over the

'Five hundred feet, I daresay.'

'More likely a thousand,' said Fraser. 'The distances are greater than you think.'

'Ah, well, don't make much difference to a man who falls whether he tumbles five hundred or a thousand feet.—Going along here?'

'Yes; the track leads to a steep descent. Then we can get up the other side, and round over the mountain, and so back to the part where, after dinner, we can go and call on Mr Redgrave. I did send on the letter straight from London.'

'All right, old chap. I'm ready.—How many miles round?'

'Not more than ten. You will not mind the climb down?'

'Well, if it's like this—yes. Hillo, what's he doing?'

Digby pointed across the *barranco* to where, a couple of hundred yards away, upon the opposite rock-face, a man seemed to be slowly descending the giddy wall.

'After birds or rabbits, perhaps,' said Fraser.

'Take care of yourself, old chap!' shouted Digby; and then, as his voice was lost in the vastness of the place, he followed his companion seaward for a few hundred yards till the track led them to a zigzag descent cut in the wall of rock, down which they went cautiously and not without hesitation till they reached the little stream at the bottom, crossed it, and ascended the other side, a similar dangerous path taking them to the top.

'By George, this is a place!' cried Digby as they paused for a few moments.

'Listen!' whispered Fraser, stopping short; and there beneath them was a panting and rustling, followed directly after by the appearance of a dark face with a band across the brow, a man with a basket supported on his back by the band, to leave his hands free, climbing up from a hidden path among the ferns, and pausing before them to set down his load.

'What have you there?' asked Fraser in Spanish.

'Dust of the old people, señor Ingleso,' said the man, smiling. 'That is one of the caves below there where they used to bury them; and he pointed to an opening just visible amongst the growth where the side of the *barranco* sloped.

'Buried? There?' said Fraser.

'Yes, señor; there are plenty of such places as this in the sides of the mountain.'

'Curious,' said Fraser, eagerly peering into the basket of brown dust, stirring it with the end of his alpenstock, and uncovering something gleaming and white.

'Why, it's a tooth!' said Digby, stooping to pick it out of the basket, but dropping it suddenly. 'Ugh!' he ejaculated; 'why, they're bits of bone.'

'Yes; very interesting,' said Fraser. 'Dust of the Guanche mummies. I knew there were remains to be found.'

'Disgusting!' ejaculated Digby, recoiling.

'Why do you get this dust?' asked Fraser of the man.

'For my garden, señor. The potatoes and onions like it, and it is superb.'

'What does he say?'

'They use it for manure for their gardens.'

Digby seized his friend's arm. 'Come away,' he said. 'No more vegetables while I stay in Isola. Hang it all, Fraser, I hope they don't put it among the orange-trees.'

'Possibly! Why not? This is the debris of mummies, the remains of the old dwellers here, made of the dust of the earth, returned to the dust of the earth; and the salts here are taken up by plant-life by Nature's wonderful chemistry.'

'I say, don't preach science,' cried Digby. 'Come along.'

'Yes, we must go on now,' said Fraser thoughtfully; 'but we shall have to come and explore these caves. I should like to take back a few perfect skulls.'

For the next two hours they wandered on through scenes of surpassing loveliness, following the faint track which led them over the mountains till they could see the sea on the other side of the little island, as they began to descend. Fraser was always busy chipping fragments of pumice and lava; picking rare plants, and making a goodly collection for study at the little *venta* or hostel where they had taken up their quarters, when a rabbit suddenly darted out across the verdant path they pursued.

'Rather disappointing place as to game,' said Digby. 'Few birds, too. I say, I expected to see the place with canaries as yellow as gold singing on every bough.—Pst!'

He caught his companion's arm, and they both stopped short to listen to a sweet pure voice singing the words of some Spanish ditty, the notes ringing out melodious and clear, though the singer was hidden among the trees through which the path led.

'There's one of your Canary birds,' said Fraser in a whisper; and directly after there was a rustle among the bushes, which were thrust aside; and Digby stood enthralled by the picture before him, as a beautiful girl of about nineteen bounded down from a rocky ledge above the path, her straw hat hanging by its string from her creamy throat, and her sun-browned face turning crimson at the sight of the strangers, who made way for her to pass, laden with flowers, which she had evidently been gathering in the openings among the trees.

'Horace, old fellow, did you see?' whispered Digby, his eyes sparkling with excitement.

'Yes,' was the quiet reply.

'Why, you old ascetic!' cried Digby. 'An angel. Violet eyes—brown hair—a complexion of which Belgravia might boast. I did not think the Spaniards had it in them.'

'Yes,' said Fraser slowly. 'Some of the old race possessed that fair hair. Mary's Philip was fair.'

'But did you notice her mouth?—Fraser, don't talk of such a vision of beauty as if she were a natural-history specimen.'

'Well, don't go on like that about the first pretty woman you see. Only yesterday, you were grumbling about their plainness, and saying that though the women here had lovely eyes, they had men's moustaches—they ought to shave.—This way—to the right, I think,' he added, for the road had suddenly forked.

'And — Well, she is beautiful,' cried Digby. 'I wonder who she is.'

'A Spanish settler's descendant, whom, in all human probability, you will never see again,' said Fraser quietly; and they both went on for half an hour in a silence which was broken by Fraser.

'Going wrong, evidently,' he said; 'this can't be the way round to the town.'

'Well, I thought we were going up hill again.'

'Ought to have taken the other turning.'

This was so evident, that they turned back, retracing their steps till, close upon the spot where they had diverged, they came suddenly upon a tall, handsome, well-dressed man, who started and looked at them curiously.

'Will the señor direct us to the town?' said Fraser, in Spanish.

The haughty searching look gave place to a winning smile, and the stranger volubly indicated the right road, and then said laughingly in English: 'But do you understand me?'

'Yes, perfectly,' replied Fraser; 'and I wish my Spanish were as good as your English.'

Then punctilious words were exchanged, and the stranger passed on.

'Do you believe in first impressions, Horace?' said Digby, glancing back, and then uttering an impatient exclamation.

'No.—What's the matter?'

'That fellow was looking after us.'

'Well, you were looking after him, or you would not have seen.—What do you mean by your first impressions?'

'I don't like the look of that fellow.'

'Insular prejudice.'

'Don't care what it is; I don't like him, and I'm sure I never should.—Why, Horace, look there!'

Not twenty yards in front was the girl they had so lately met; and as Digby drew attention to her presence, he stopped and hastily picked up a twig of flowers such as he had seen her carrying, and which her despondent attitude suggested that she had dropped. For she was walking slowly on with her face buried in her handkerchief, evidently sobbing bitterly; and as they followed, she let others of the flowers she had gathered fall.

'Stop!' whispered Fraser hastily, as he caught his companion by the arm.

'Going to see if I can'—

Digby did not finish his sentence, for the girl had evidently heard the harsh whisper. She turned, gazing back at him in an affrighted way; and as they caught sight of the tearful convulsed face, she darted down a side-track, and was gone.

'What do you think of that?' cried Digby excitedly.

'A Spanish woodland romance,' said Fraser dryly.—'What do you think about it, Tom?'

'That I should like to go after that haughty-looking Spanish customer and ask him what it all means.—Shall I?'

'No. Be sensible for once.—Ah, you can see the town from here.—Come along.'

CHAPTER II.

The accommodation at the *venta* was of the humblest description; but the place was cleanly.

the hostess was attentive, and she was evidently proud of being honoured by those she termed the illustrious strangers, who had come from the main island to her unfrequented house.

The homely dinner was discussed, the cooking declared to be not so very bad, the Malvasia an outrage on the name of wine, and the magnificent view from the open window a banquet in itself.

'Yes,' said Fraser; 'I'd have braved a worse voyage to see what I've seen to-day.'

Digby, who was toying with an orange which he had begun to peel, and then left untasted, looked up sharply, and his face flushed a little as he exclaimed: 'Yes; wasn't she lovely?'

'I was talking about the scenery,' said Fraser coldly.

Digby turned impatiently away, and began to fill his pipe as he gazed out over the flat roofs of the houses among which the leafy crowns of stately palms arose.

'Don't turn like that, Tom,' said Fraser, after a few moments' silence; and he rose to lay his hand upon his young companion's shoulder.

'Turn like what?'

'Huffy, my dear boy. I wouldn't, Tom; let's be sensible. You must not be so inflammable. We have come to admire the beauties of Nature and to collect in this, one of the least visited of the Canaries. You must not try to work up a romance by taking a fancy to the first pretty Spanish maiden you see.'

Digby flushed more deeply, and as he gazed up in his companion's face, sober quiet Horace Fraser could not help marking what a frank handsome young Englishman he looked there, with the golden rays of the westerling sun bathing his countenance in its glow.

Digby's eyes for the moment looked resentful; but a smile came upon his lips directly. 'All right, Horace,' he said. 'I am an awful donkey, I know; but that girl's sweet face impressed me; and then seeing her evidently in trouble directly after that Spanish chap had left her, seemed to raise my bile.'

'How do you know that gentleman had just left her?'

'Eh? Oh, of course! I couldn't know, could I?—There; it's all over, and I'll return to my duty like a man.—Let's have a look at to-day's collecting; and to-morrow I'll swallow my repugnance, and we'll do some of your ghoulish ethnology in the mummy caves, eh?'

'And to-night, let's go up in the cool and call on Mr Redgrave. I want him to give us a few hints about what we ought to see and how to get a guide.'

'Right. Let's go at once, before sunset.'

The walk was delightful, the western side of the island being glorious in the glow of radiance in which it was bathed, while the sea and the islands around seemed glorified by colours that were almost beyond belief.

'Better than sitting in that stuffy little room, Tom.'

'Bless you, my son, for bringing me here,' said Digby merrily.—'Cheerful kind of growth to tumble among,' he added, pointing to the prickly-pears which abounded on one side of the narrow rocky path they were ascending, the

other side being furnished with an abundance of ragged-leaved bananas.

'There's a house in that nook yonder,' said Fraser; 'that must be it.'

'And this chap coming is our man, for a shilling,' said Digby, as a tall, sturdy, middle-aged personage came toward them smoking a huge cigar. 'An Englishman, by the way he keeps his hands in his pockets.'

'Hush!' whispered Fraser, as the man approached; and then, addressing him in Spanish, he asked to be directed to Señor Redgrave's house.

'Suppose you ask me in English, sir,' said the other bluffly. 'You are Mr Fraser, I presume; and this is Mr Digby?—Glad to see you, gentlemen. I had your letter, and was coming down to the *venta* to hunt you up. Don't often see a countryman here; so, before we say any more,' he added, after warmly shaking hands, 'I'll give orders for your traps to be fetched up here, and you can make this your home while you stay.'

But Fraser would not hear of it. 'We are in capital quarters,' he said, 'and will not impose on you.—But if you will have us, we'll come up pretty frequently for a chat.'

'You shall do as you like, gentlemen.—In here, please.'

'By George!' cried Digby involuntarily, as they passed through a gate into a lovely villa-garden, 'what a paradise!'

'Well, pretty tidy. You see, everything rushes into growth here with little trouble. I am a bit proud of my home, and make it as English as I can. It was my poor dead wife's favourite place, the garden.' He raised his hat slightly as he uttered the last words, and a silence fell upon the group.

'Forgive me,' said the host the next moment, as he looked in the eyes of his two visitors. 'You are Englishmen, and can sympathise with one who has lost a dear companion out here in a strange land. But there, that's fourteen years ago, gentlemen,' he said cheerily; 'and I'm not quite alone.—Here, Nelly!' he cried; 'where are you? Visitors from home, my dear.'

The sun was very low now, and it turned the porch, covered with Bougainvilleas and a lovely scarlet geranium, into a frame of gold, into which suddenly stepped, as it were out of the inner darkness, the picture wanting to complete the scene.

'My daughter Helen, gentlemen,' said their host; and both the visitors stood speechless, Digby even spellbound. For there before him, winning in her beauty, stood the lady of the semi-tropic wood, whose sweet notes he had heard, and whom he had seen in smiles and tears; while, as he gazed at her, the bright look of welcome in her eyes changed to one of pain, and it was as if a dark shadow had been cast across her.

It was no seeming. The edge of the sun was kissing the western wave, and the tall dark shadow of a man was cast across her as a click of the gate was heard, while Mr Redgrave turned sharply and said in rather a constrained tone of voice: 'Ah, Señor Ramon, you here?'

Digby and Fraser turned sharply, as if to seek

the cause of Helen Redgrave's troubled face. The Spanish gentleman they had encountered in the woodland was coming toward them hat in hand.

NORWEGIAN FOLKLORE AND SUPERSTITIONS.

THERE is perhaps no country in Europe richer in legendary lore than Norway. Until very recent years, the communication of the dwellers in the more remote country districts with the outside world was small indeed, and old-time superstitions have lingered long and die hard among these simple and credulous people. To listen to their tales of goblins and sprites, of trolls, gnomes, and other uncanny creatures, brings back memories of childhood's days and the nursery stories with which our youthful minds were both delighted and scared. The mountains and forests, the valleys, streams, and fjords are by their imaginations peopled with curious beings, endowed with supernatural power, and with whom it is well to keep on good terms. Can it be that in these superstitious beliefs there linger traces of the nature-worship of the earlier inhabitants of Scandinavia? During a short tour in Norway last summer we collected a few of the legends believed in by the people of the Sogne district, which have, we think, never been previously published.

There is a belief among the peasantry that the *seters* or upland farmhouses, which are inhabited in the summer by those who are banished at that season to the high and distant pastures to look after the cattle, are in the winter taken possession of by a race of little people, who are resentful of any interference with their privileges, and are offended if the cattle are brought up earlier or kept later than usual. The following tale was told us in the Aaral Valley. One fine autumn, a man named Knut Kvigne had kept his cows and horses at the *seter* a week later than usual, and he found that he experienced a great deal of trouble in collecting them together in the morning. One night, he was sitting eating his oatmeal with a wooden spoon cut by himself from a birch-tree, when he heard a knock at his door. Startled by such an unusual occurrence as the advent of a visitor in so remote a place, he called out somewhat timidly, 'Come in;' but there was no response to his invitation. Thrice was the knock repeated and thrice was the stranger bidden to enter; and then there appeared through the partly open doorway a hideous head with two long ears like those of a pig. Knut was a daring fellow, and he seized the creature by its ears and compelled it to enter. On being questioned, the visitor confessed that he was a *burga-trudel*, and said he occupied the *seter* hut in the winter, and demanded that it should be given up to him. High words were followed by blows; and in the struggle that ensued, although he was a strong man, Knut was in danger of being overcome.

He swore at the creature, and each time he did so, he found that his adversary grew stronger; and then he called to God for help. When the sacred name fell from his lips, Knut began to prevail, and ultimately he triumphed. He secured the creature, and would not release him until he had extracted from him a promise never again to interfere with the people in the *seter*, and always to drive the cows and horses close to the hut in the morning; and he ever afterwards kept his word.

There are in Norway large barrows on the hillsides, which have been found to contain swords and arrow-heads, the weapons of an earlier race of inhabitants. These have probably given rise to the stories which are current of the existence in former times of a race of giants, who in quite recent days have again occasionally appeared, and wrought mischief on those who fell into their hands. An inhabitant of Lærdalsoren, on the Sogne Fjord, told me a story which he said was generally believed. One night a man was riding a spirited horse along the valley at the back of the village, and on passing one of these barrows he pulled up and called to the giant who was supposed to be buried there: 'Come out, and let me taste your ale.' A huge figure slowly emerged from the hillside, carrying a great horn of ale, which he presented to the man, who pretended to drink, but really threw it over his shoulder, and put spurs to his horse, intending to keep the horn. The giant pursued, and there was an exciting chase; but eventually the man won, and retained the coveted horn. When he reached home, he found that some drops of the ale had fallen upon the horse, burning off all its skin and hair. The very intelligent man who told me this tale assured me that he did not give credence to giant stories, but that several strange things had happened to him which could only be regarded as supernatural occurrences. These stories, though trifling and somewhat puerile in themselves, are worth repetition, as they show how superstitious and credulous are even the more intelligent among the Norwegian working-classes.

My informant told me that once, when he was out walking, a white dog had appeared, and followed him for some distance; but suddenly, while he was looking at it, the animal sank into the earth and disappeared. On another occasion, when he was a boy, he had driven a cow home for an old lady, who promised him a *Kringle* cake for his pains; but she died suddenly without keeping her word. Lad-like, the loss of the cake preyed upon his mind for a time; but he had forgotten all about it, when one night, on his way home from the woods, the old lady, appeared to him, leaning upon her stick in the same way in which her lameness had compelled her to do in life. He was frightened, and ran away; but in his flight he lost his shoe. Not daring to go home without it, he returned to the spot, and again saw the old woman; but he could not muster courage to speak to her. Stories like these might, of course, be accounted for in lots of ways; but my informant could not be induced to look upon them as other than supernatural visitations.

In the Evil One and his works and appearances

upon earth the people have, or had within quite recent times, as strong a faith as had our own ancestors a few centuries back; and some of the clergy were supposed to be in league with him. There is a story told of a priest who lived at Dale, and was supposed to practise the black art. We visited his old church, situated near the picturesque village of Dosen, on the banks of the fjord. It is a curious old stone-built edifice, and in it is hung a picture of this severe-looking priest with his wife and seven children. He frequently indulged in nocturnal rambles, and the rumour was current that at such times he was not engaged in business that could bring any good; so his wife became alarmed, and begged an old man-servant to follow him. The idea entered the man's head that he would give his master a fright, and cure him of his love of strolling about alone at night; so he managed to procure one of his mistress's night-dresses; and having discovered the preacher standing on a flat rock by the roadside, he suddenly appeared in his ghostly disguise. The priest demanded who he was; and obtaining no answer, muttered some cabalistic words, and as a result of them, the man sank up to his knees in the rock. The priest repeated his question, and again there was no answer, so this time the man became entombed to his middle; and on refusing to disclose himself on the third demand, he sank to his shoulders. Thoroughly frightened, the poor fellow confessed all; but the priest declared that it was too late, as his master had claimed him; and the victim disappeared altogether.

We were also told of another priest who had dealings with the Evil One, and who was tried at Christiania and condemned to die. He begged hard for his life, and was only reprieved on condition that he would exhibit his supernatural powers by preaching the same day in Trondhjem Cathedral, some three or four hundred miles away. This he promised to do; and, summoning a bad spirit, said to him: 'How fast can you carry me to Trondhjem?' He replied: 'As fast as a horse can go.' But that would not do; so he called a second spirit, who promised to take him as quickly as a bird could fly. But his offer, too, was declined. A third spirit promised to take him as quick as a thought, on condition that he might have the souls of all who went to sleep during the parson's sermon. He hastily closed with the offer, and they started. The Evil One went round the coast, and when out at sea, endeavoured to make the priest repeat the name of God, knowing that if he did so he should be compelled to drop him. But the priest was too sharp to be caught napping, and only urged his unwilling steed to greater exertions. When they arrived at Trondhjem, the sermon was delivered; but so earnest and powerful was the preacher, that, contrary to custom, not a soul went to sleep, and the Evil One was cheated of his prey.

These are specimens of the tales believed in and told round the blazing pine-logs during the long and dreary nights of winter. Many more stories, doubtless, might be collected and preserved, if only some among the increasing number of summer tourists to this lovely land, which is now being brought so close to us by the fast and commodious steamers of the Wilson and other lines, would take the trouble to look out for and record them. Education is now compulsory in

Norway; ignorance is fast disappearing, and with it many of the old beliefs of the people, so that in all probability these old legends of folklore will soon be lost.

DEAN MALTON'S RESOLVE.

THE STORY OF A COLLEGE LIVING.

THE rector of Wilbury was dead. He was an old, old man, who had been born at the very end of the last century, and, after successively filling the posts of Scholar, Fellow, and Tutor of his college, with great credit to himself, his college, and his university, had in his old age, despairing of ever obtaining the Mastership, accepted the living of Wilbury. There in the little village, hidden away in a narrow valley that ran like a long furrow through the plains of Downshire, the brilliant mathematician had passed the evening of his life, forgotten by the world, buried in his books, corresponding with a few learned Societies, and giving his parishioners a kindly nod and word on week-days, and on Sundays a sermon which they valued all the more because they could not understand its learning.

The end had been expected for some time, and yet there was no little commotion in the Combination Room of St Martin's when his death was officially notified to the college; for it was a tradition that the living, although it was of no great value, should be held by a scholar of reputation and attainments. For nearly two centuries a succession of the most learned men in the college had retired to spend their last days in the old rectory on the edge of the Downs; and to have the refusal of the living was a high compliment, and an honour that set the seal to a notable career.

That evening after Hall, the Combination Room was fuller than usual; the younger Fellows, instead of looking in for a moment and then hurrying off to some musical party, or returning to wife and family in a brand-new villa residence in the outskirts, hung about in groups talking nervously and fidgeting from one leg to the other, avoiding the topic of the vacant living, and yet unwilling to go and leave the field to others. Not that there was any great choice of candidates for the Downshire rectory; most of the junior Fellows were laymen, and the senior Fellows who were in orders either held college offices or better livings than Wilbury.

The Bursar, the master-mind of the college, sat in his accustomed armchair by the fire, every now and then glancing with grim amusement at the unwonted assemblage, but uttering no word. Opposite to him sat the senior Tutor, a thin sly man, with a painfully nervous manner, whose habitual unrest was aggravated by the feeling that all men were thinking of him as the new rector. He sat twiddling his fingers and shaping the castles of his youth in the glowing embers of the fire with twitching lips and elevated brows. The younger Fellows stood in a wide circle round the hearth or by the table, discussing the situation in low tones, until the old French clock that ticked solemnly on the mantel-piece warned them that the occupants of the modern villas were awaiting their coming with impatience. One by

one they trooped out until only the usual three or four remained, and then at last the Bursar spoke: 'I suppose you will take the rectory, Bowles?'

The Tutor started guiltily from his day-dream. 'No, I think not,' he stammered. 'I am too old; I am unfitted; and I could not leave the college.'

'Well, well. Best have some leaven in the mass,' growled Roebuck, the Bursar, glancing contemptuously towards the door, which had just closed on the youngest Fellow.

'Poor old Cawthorn!' went on the Tutor after a pause; 'he was a clever man.'

'Born three-quarters of a century too soon. If he had deferred his entry into the world, he might have had as many "pups" and have made as much money as any "coach" in the university.—I think that is the correct form of words, is it not, Malton?'

The man addressed by the Bursar answered in a low soft voice rather laboured in its precision of accent and phraseology: 'I believe so: I have heard some such expression made use of by members of this college.'

'There are few men of his standing left,' said the Tutor, still thinking of the late rector. 'I suppose it will be offered to Thompson.'

'He won't take it,' said Roebuck; 'his own place is much better, and not such an exile.—You'll have to take it, Bowles.'

'I? Oh no. I should never make a parish priest; I could not live away from the college.'

'Then Malton must have it.'

Malton blushed. He was a man not much over thirty, with small eyes, no features to speak of, a complexion like pale yellow soap, and on each cheek a wisp of black whisker that looked as if it had accidentally slipped down from his hair. He hesitated, and muttered something about the offer being a great compliment. Here was a new idea, and one that seemed likely to be the ultimate solution of the difficulty. Somehow the suggestion seemed to have put an end to the conversation. They sat in silence, looking into the fire and turning the matter over in their minds, but without pursuing the subject any further. As usual, Malton was the first to retire, leaving the two elder men sitting by the fire, with the founder of the college, a chancellor, three bishops, and several noblemen looking solemnly down at them from the walls.

The Rev. Joseph Malton went back to his rooms with his mind in an unusual state of ferment. He lighted his lamp, which his gyp had placed ready for him, and seating himself at his desk, tried to take up the thread of his work as on every other evening. He was engaged on a learned treatise, which the undergraduates averred dealt completely and exhaustively with the subtler properties of the common pump; but his hand had lost its cunning and strange visions kept floating before his eyes. He sighed, put away his papers, and drawing his heavy arm-chair nearer to the fire, settled himself down to read—but to no purpose. The Bursar's suggestion that he should be the new rector of Wilbury had strangely agitated him. After all, why should he not take it, and—he only thought it in a whisper—marry? It was true he could marry as he was; but the position of a married

Fellow, with a wife and family in a draughty villa outside the town, did not appeal to his imagination; whereas the status of rector in a country parish seemed to him full of dignity and of all that gives interest to life. The book he was trying to read slipped from his grasp and slid into the fender; but he took no heed of it, he was so absorbed in his reflections. He was thirty-five, and Fellow, Dean, and Classical Lecturer of St Martin's. He had almost reached the summit of his ambition; but never till that evening had the idea of merging the college don in the country rector crossed his mind.

The entry of his gyp Turner to put out the tea-things and give a last look round interrupted his reverie. Turner was an untidy, shiftless creature, with a talent for breaking china, and with a Cockney accent ingrafted on the intonation of East Anglia. The undergraduates on his staircase were always at war with him on account of his forgetfulness and incapacity, and he lived in a constant state of expostulation and self-excusing. He did his best with the Dean, for he knew it was well to have the authorities in his favour; but the other resident Fellows agreed that only a man so little exacting as Malton could have stood Turner's peculiarities so long.

Turner finished his perfunctory look round the room, and having placed the tea ready, said: 'Shall you want anything more to-night, sir?'

'No, thank you,' replied the Dean.

'Good-night, sir.'

'Good-night, Turner.'

The door closed upon the gyp, and abruptly shut out a war-whoop that rang up the staircase to summon Turner to one of his indignant undergraduate masters.

The Dean picked up his book, made his tea, and resumed his reverie; but Turner's entrance had given his thoughts a new direction. His memory cast back to his boyhood, to his hopes and ambitions as a growing lad, to the work he had set himself to accomplish, and to the life, devoid of pleasure and almost of recreation, that he had led till within the last few years, when his mode of living had become stereotyped, and his nervousness in society confirmed. He saw himself once more a little boy in the house of his father, who had been a small tradesman in the town; and it was almost with a shock that he remembered how in those far-away days he had actually looked up to his shiftless gyp Turner, and had listened with awe and reverence to the stories of dons and undergrads that his playfellow used to retail. Five-and-twenty years ago Turner's father had lived next door to the Maltons, and the Turners held their heads high, for Turner was gyp, and his wife bedmaker at St Martin's; and they considered themselves as belonging to the university; whereas old Malton and his wife only belonged to the town. He remembered how he had envied young Turner his intimacy with the ways and traditions of college and university life, and with what absorbing eagerness he had swallowed all the accounts of the respect with which the Master and Fellows of St Martin's asked for and followed the advice of their gyp and bedmaker; and how he had always considered old Turner as virtual ruler of St Martin's, and as a personage to whom even the great vice-chancellor himself owed no small por-

tion of his glory. In his mind he ran over his entrance with Turner at the grammar-school, how he had worked and slaved even as a lower school-boy, with the hope of being able to win a scholarship, and see that glorious university life at first hand and with his own eyes; and how the idleness and mischievous tricks of young Turner had been the despair of the masters and the admiration of his schoolfellows.

The intimacy between the two had naturally lessened when Turner was taken from school and sent for two years as boots to a London hotel, before joining his father as a sort of assistant gyp at St Martin's. In London, Turner had further studied the art of giving the maximum of importance to a minimum of work; while Malton had been rising steadily to the head of the school, and had succeeded in persuading his father that he was not a useless dreamer after all. The Dean smiled a little sadly when he recalled the overwhelming rapture with which his election to a school exhibition had filled him, and his hopes and fears as he entered for scholarships at several colleges, finally becoming senior classical scholar of his year at St Martin's. Old Turner had been the first to bring him the news of his election, and the Dean well remembered the half-patronising, half-deferential manner with which the old man had congratulated him. He could have wished that his success had been gained at some other college, for the Turners were inclined to presume on old acquaintance and to be unpleasantly familiar with the new scholar; but as they all became more used to their respective positions, this feeling of awkwardness wore away, and there remained only so much friendship between them as could be expected to exist between a university man and a gyp.

Then another figure crossed the field of the Dean's recollections, the figure of the girl who had prompted the idea of marriage in a country rectory. Mary Andrews had been the only girl the Dean had ever so much as thought of admiring; she had been the Chloe and the Delia of his school and college compositions, and on her shrine he had secretly heaped all the well-worn and exaggerated compliments that are the stock-in-trade of lyric and elegiac verse. He had been very fond of her, or rather of the ideal he had created from her, in his quiet subdued way; but he could not help confessing to himself that Turner with his impudent assurance and fund of anecdote had been more in her good graces than ever he had been. It was with a sort of guilty feeling that he remembered that he had not even seen his Chloe for ten or twelve years, and that by now the little short-frocked maiden, with the laughing blue eyes and tangled golden hair, must be a full-grown young woman of twenty-five or twenty-six, if she were not long since married.

The Dean excused his remissness to himself by the reflection that he had always been too busy to think of love-making. He remembered how hard he had worked as an undergraduate in order to become Seventh Classic, and to get a place low down among the Senior Optimes; and since then how his duties as Fellow, Classical Lecturer, and Dean, had taken up all his time and thought. Anyhow, if she were still unmarried, twenty-six was a very good age for a clergyman's wife, especially for one who would have

to support the responsibilities which a country rectory entails. The Dean's mind was easier; he would accept the living of Wilbury if it were offered to him, and with that as a wedding gift, would go in search of a wife. Thereupon, he roused himself, made his tea, resumed his studies, and finally went to bed determined to sleep upon the matter.

When the Dean awoke next morning his resolution was unshaken. The project seemed as excellent by daylight as by candlelight. He shaved himself, and conducted morning service in the college chapel to a strange undercurrent of thought that perhaps he had only a few more weeks in the dear old place. The idea filled him with a subdued sadness; but when he returned to his rooms he noticed for the first time how dull a solitary breakfast is. He was not in love with Mary Andrews, he knew; he had not seen her since she was grown up; but he thought of the pretty little girl who had been the object of his silent boyish admiration, and determined that he would be a married rector without delay.

Turner seemed possessed with a spirit of uneasiness that morning while clearing away the breakfast; he banged the things about beyond his wont, and was more than usually reckless with the massive stoneware cups with which the Dean had in self-defence provided himself. The Dean marvelled at this agitation, but held his peace.

Old Turner had now been dead some years, and his son had, chiefly through the Dean's influence, been given the staircase, on which the widow still continued as bed-maker. When everything had been hurled into the gyp-room, Turner approached his master and coughed meaningly. Malton recognised the signal, and looking up, said: 'Well, Turner, what is it?'

'Beg pardon, sir,' said the gyp; 'mother's growing old.'

'Is she?' replied the Dean, who had noticed no alteration in Mrs Turner's appearance for the last twenty years. 'I'm sorry to hear it,' he added rapidly.

'Yes, sir,' went on Turner; 'she ain't what she was.'

'She's not ill, I hope?'

'No, sir; not ill, sir; but I was thinking she might want a little help. The gentlemen's beds is heavy, you know, sir.'

'Dear me,' said the Dean, 'perhaps she can recommend some one to the college?'

'Well, sir, yes, sir,' stammered Turner, blushing furiously; 'the fact is, sir, begging your pardon, I was thinking of getting married.'

'Dear me,' thought Malton; 'how very curious; just what I was thinking of myself; but he only said: "Indeed?—Oh, I see; you would like your wife to succeed your mother?"'

'That's it, sir,' cried Turner, greatly relieved; 'if you could speak for me, sir.'

'Certainly, I will do all in my power,' replied the Dean; 'you may rely upon it.'

'Thank you, sir, thank you,' said Turner, knowing that the matter was as good as settled.

'And when is it to be, Turner?'

'Directly, sir; and I took the liberty of sending her with mother to-day, sir, just to help, like.'

'Certainly, certainly. Is she here now?'

'Yes, sir,' replied Turner; and without more

ado, he opened the door and beckoned to some one outside.

The astonished Dean saw his rooms invaded by a woman, other than Mrs Turner, for the first time during his occupancy of them. It was now his turn to blush, as a stout young woman with rosy cheeks and a quantity of straw-coloured hair entered shyly and began courtesying to him. He quickly recovered his composure, however, and remarked: 'So this is your future wife, Turner? Well, I'm very glad to see her. And when is the ceremony to be?'

'We did think of next Sunday, sir,' said Turner doubtfully, and as if his banns had not been duly read for the three necessary Sundays.

'You must allow me to marry you,' continued Malton. 'I shall take it as a favour on your part.'

'Thank you, sir; I was going to ask you if you would be so kind.'

'And I will see that Mrs Turner is allowed an assistant. After so many years' service in the college, she has some claim upon us. You may depend upon me.'

With many expressions of gratitude, the gyp and his promised bride left the room; and the Dean prepared to take the Classical Lecture, all the while meditating on the curious coincidence that both Turner and himself should contemplate matrimony at exactly the same time. His gyp's success seemed a good augury for the prosperity of his own schemes, and he gathered up his books and papers and quitted his rooms more resolved than ever to accept the college living.

Turner had lost no time in making sure of his betrothed's position in the college. The Dean found the young woman on the staircase preparing to wash the stairs under the eagle eye of Mrs Turner. He nodded good-morning to the old woman, and as he did so the younger one stood aside to let him go past. The light fell upon her face, and something about her struck him as familiar. He stopped and asked her name. With an accent of surprise and reproach in her tone, she replied: 'Mary Andrews, sir!'

The Dean went down the stairs and across the quadrangle to the lecture-room. His castle in the air had collapsed like a house of cards. The Mary Andrews of reality was far from being his ideal; he had hardly recognised her. He felt that Wilbury rectory would never have owned her as its mistress had she been free. He sighed once over the grave of his hopes and passed on.

The Rev. Joseph Malton is still Dean of St Martin's, and his old schoolfellow and his first and only love are respectively gyp and bedmaker on his staircase.

THE 'DRY-ROT.'

DRY-ROT is one of the most dreaded enemies of the builder and house-proprietor. No one of all the fungus tribe is more insidious and deadly in its attacks. For in its very nature it works unseen and unsuspected, and its presence is only too frequently detected after its ravages have made irreparable inroads into the soundness and stability of a building.

The writer was recently called upon to examine a building erected only half-a-dozen years ago in

a most substantial manner, and elaborately fitted up and used as a Sunday school. But unfortunately, through some oversight or neglect, no adequate ventilation underneath the floor had been provided for, whilst the fact of its being only used regularly on one day a week would tend to induce stagnation of the air and prove favourable to fungoid growths. For some time a fusty smell had been noticed; and latterly, in certain corners the wood was observed to be decayed; so it was resolved to take up the floor and ascertain the cause. When this was done, the sight disclosed was marvellous, rivalling the ideal scenes of fairyland. In some parts the joists were completely clothed with a tight, cottony, cobwebby substance, hanging here and there in tassels and fringes. The dormant walls and ground underneath the floor, with all the rubbish of chips, broken bricks, &c., generally found in such places, were covered with the same ethereal-like substance, of the most delicate texture, white and fleecy as wool, rivalling the fairest unsullied snow in lustre. Indeed, in many places the deposit much resembled freshly drifted snow when it is blown through small crevices.

This represents the youngest or immature stage of dry-rot. When more luxuriant, it forms cobweb festoons in the corners, which are often traversed by threads of the most lovely orange, purple, and magenta hues, and distilling drops of an amber tasteless fluid. Sometimes it is aggregated in large masses several inches thick, of a pasty doughy consistency, retaining the impression of the touch, and clinging to the fingers when handled. It may be torn from the walls or beams in great sheets, strongly resembling cotton wadding—with the under surface felted into a paper-like texture—and traversed by branching anastomosing veins, like roots ramifying in every direction. The strong dormant walls which support the floor-joists are two feet thick, and built of stone and lime, yet they are so permeated by the fungus in every part, that when broken down, every stone is seen to be encircled and sheathed by the thread-like roots, often an eighth of an inch or more thick, and so tough and matted that they can be dragged out in ribbon-like shreds; and the mortar has become so friable that the walls can be pulled down by hand. The internal walls have been wainscoted four feet high with varnished pitch pine; and in various places the fungus has crept to the very top between the walls and the wood, and adhering to both.

So far has been descriptive of the *mycelium* or spawn, which is the vegetative portion of the fungus, analogous to the roots of ordinary plants, and is the part of dry-rot most commonly seen and noted. But I was fortunate enough to secure several magnificent specimens of the fructification or spore-bearing portion, analogous to the flower, fruit, and seeds. On some of the beams the fungus could be seen foaming along the apparently sound wood, the advancing crest showing a well-defined margin an inch in height of the

consistence and appearance of well-whipped white of egg. An inch or two from the edge of this frothy mass it became marbled with coloured streaks, soon merging into a uniform ruddy-brown hue. The texture becomes firm and leathery; and the surface is rugged, and corrugated with the most exquisitely wavy cell-like reticulations, excelling the most intricate fretwork patterns, and showing the most involved network of ridges with flexuous outlines, forming shallow cavities, but not true pores. These in the early stages are filled with fluid, but soon produce spores with an amazing fecundity; these are of a bright ferruginous tint, and in this case were so abundant that all the ground and every object for many square yards was completely covered with the brown dust, as if the place had been sown with ground cinnamon. These spores finding a suitable nidus, speedily germinate, and form independent centres, from which the disease spreads. This spore-bearing portion may be stripped off in sheets, when it has the most fantastic resemblance in every way except colour to a piece of tripe! When removed from the beam it leaves the wood fair and smooth and apparently uninjured; but it is only so in external form, for it has been saturated with the *mycelium*, which has devoured all the cell-contents, leaving only the external shell. The seemingly sound beam can be cut like a piece of soft cheese, and in a few months will crumble into an impalpable powder. And so the cycle of life goes on—one organism preying on another, and thus fitting it for the sustenance of a third.

Obnoxious as the attacks of dry-rot may be to man, it is only because he interferes with 'the balance of Nature,' and by endeavouring to preserve the monuments of his industry, prevents Nature from remoulding them in her great chemical and vital laboratory. The fungus which preys upon the dead or decaying tree only the sooner hastens its restoration back to its original elements, to again fit it for sustaining another and it may be a higher type of life.

So destructive are the depredations of dry-rot, that it may well be called the terror and despair of architects and carpenters. No care or precaution can be too great to prevent its entrance into a building, for if once it finds a lodgment, its eradication is a herculean if not an impossible task. Professor Burnett, a competent authority, graphically relates how a house he occupied was twice renovated in four years, and had ultimately to be pulled down. In the old era of oak-built ships, they were sometimes found to be unseaworthy before they left the stocks, with such celerity does it do its deadly work. As for remedial measures, prevention is the only certain cure. The selection of sound well-seasoned timber is as essential as the avoidance of damp, and the securing of adequate ventilation in every part of the structure. The most efficacious prophylactic is saturating the timber with creosote under high pressure, so as to thoroughly permeate every portion of the wood. This has been practically proved in coal and other mines where this destroyer runs riot, and its ravages entail much expense and insecurity, and where its wailing flakes of fleecy white have a most weird and ghastly effect in the 'darkness visible' of the pit. In certain mines in the north of England where

only creosoted timber has been used for the last thirty years, the extra cost has been amply repaid by the comparative indestructibility of the timber thus treated. In housebuilding, a wise precaution is the well smearing of all underground floor-bearing walls with tar or pitch, which prevents the *mycelium* finding a lodgment amongst the mortar in which it revels and disintegrates its adhesive property.

The popular name of dry-rot has no reference to its occurrence in dry places; on the contrary, a certain degree of dampness is absolutely necessary for its growth; but it refers to the fact, that it so completely extracts all moisture from the wood on which it feeds that it ultimately crumbles into dry dust. Its botanic name of *merulius* is essentially the same as *merula*, a blackbird—why, it would be hard to divine, as there cannot be much mirth or singing associated with the fungus, whatever may be the case with the bird. It may be because it loves darkness=blackness. The name was formerly applied to the genus now called *Morchella*, and we still have in common language moril, a mushroom, and merle, a blackbird. The specific name of *lacrymans* refers to the drops of fluid exuded by the plant when in full vigour. But it might more aptly be applied to the tears shed by the proprietor who suffers from its destructive attacks.

AN UNFORGOTTEN COUNTRY.

My friend, I may not see your face,
Nor watch each well-remembered grace;
But you will always hold a place

Within my memory, though we stand
So far apart. The sea and land
Divide us; and we clasp not hand.

Yet, dear, I know, though some forget
The past, you will remember yet
The country where we two first met.

Deep in your heart it will remain,
With all its mingled joy and pain;
The past is past, and not in vain.

We would not have it back once more,
From that far-distant, silent shore
Where there is rest for evermore.

Nay, rather let us turn our eyes
To where the future hidden lies
From us. Beneath the clear blue skies

The world may have for you in store
A gift we dream not of; ay, more,
Beloved, than it gave of yore.

But, dear one, you will ne'er forget
The country where we two first met—
The country that you love so yet.

UPON RED-TAPE.

THE redness of red-tape is itself a specimen of red-tapeism. Why should not a tribe of original lawyers and politicians arise who would 'burst the bonds of use and wont' and tie up their bundles in green or blue or yellow? But we pass on from that trivial inquiry to the consideration of the essence of red-tape; and we find it consists in the distribution of papers into ticketed parcels, each parcel being a distinct business. So far good. We see the spirit of order at work, and no man of affairs can laugh at the spirit of order. But when the spirit of order, having arranged his bundles, proceeds in a carnally lazy way to go to sleep upon them, then we are entitled to begin our gibes. 'Order is heaven's first law,' and the initial arrangement of papers into bundles and pigeon-holes gives a whiff of celestial air. But it is disgraceful to tie up our souls in the same bundles and put our faculties into pigeon-holes.

'Freddy, my dear, come and let me see whether you have learned your alphabet.—What is the first letter?'

'A, mamma.'

'And the next?'

'I tell you what, mamma! Let's call all the others A.'

The alpha of business is orderly arrangement. It is a bower adorned with red-tape; but we must not linger there; beta awaits us, gamma calls us, delta beckons us; we may not rest till we have planted our alpenstock on omega.

'Well begun is half-done,' says an old motto; but it is only true when the spirit of progress sits on the box-seat of the *Well-begun* coach. It is well to disturb the fatuous satisfaction with which we or others contemplate the first step of a right course, the stage of red-tape, the stage of bundles and pigeon-holes. For it is indubitable that reasonable contentment with ourselves upon taking that stage soon passes into somnolence. Some people's consciences are like cats; as soon as they are stroked the right way, they purr and—go to sleep.

The second form of the disease is a multiplication of the bundle and pigeon-hole system, a dread of free action, and a passion for routine. The elementary cell becomes a cellular structure. Pigeon-holes open out into pigeon-holes, like the 'Maze' puzzles that please children, and the rules of the game must be observed. To get to the heart of the maze you must find the clue; and to break through a wall or jump over it is treason. The aged monarch is burned to death whilst the order to pull him out of the fire is passed downward through the inverted hierarchy of servants.

A luxuriant example of this form of red-tape was exhibited by Captain Vivian to the admiring House of Commons some years ago in Committee on the Army Estimates. The initial fact was the need of a pair of bellows in the Curragh Camp. After a preliminary whetting of the appetite of the red-tape dragon by a lengthy correspondence, the operation of getting this pair of bellows proceeded as follows:

February 12.—War Department gives authority to the local commissariat officer to indent [that is, give an order] on the Royal Engineer Department for a pair of bellows.

Same date.—Local commissariat officer applies to district engineer officer for a pair of bellows.

Feb. 16.—District engineer officer applies to military store officer at Dublin.

Feb. 19.—Military store officer informs royal engineer officer at Dublin that he can supply the bellows on requisition.

Feb. 20.—Royal engineer officer at Dublin forwards this information to royal engineer officer at the Curragh.

Feb. 21.—Local engineer officer at the Curragh informs royal engineer officer at Dublin that he has no form of requisition.

Feb. 22.—Local engineer officer at the Curragh asks the local commissariat officer if the proposed bellows would do.

Feb. 23.—Local commissariat officer replies 'Yes.'

Feb. 24.—Local engineer officer informs local commissariat officer that he must apply to the

royal engineer officer, Dublin; and application is made accordingly.

Feb. 28.—Military stores officer at Dublin answers that he will supply the bellows on an order from the War Office.

Feb. 28.—Local commissariat officer produces authority from the War Office and reads it to local engineer officer.

March 1.—District royal engineer officer declines to have anything to do with a service not brought to his notice through the proper authority; and local commissariat officer refers matter to commissariat officer in Dublin.

March 2.—Commissariat officer in Dublin relegates the question to the deputy quartermaster-general, Dublin.

March 3.—Deputy quartermaster-general passes on the requisition to quartermaster-general, Horse-guards.

March 5.—Horse-guards refer to War Office, and War Office refers to commissariat-general-in-chief, London.

March 10.—Commissariat-general-in-chief asks director of stores to give authority; director of stores states that the commissariat officer should include the bellows in the annual estimate; and commissariat-general-in-chief writes to the Horse-guards and to the commissariat officer, Dublin.

March 20.—Commissariat officer at the Curragh writes to know why he does not get his bellows.

Whether he ever did get them, we do not know; but it ought to be some satisfaction to him to know that his need of a pair of bellows engendered a morbid growth of red-tape, which, for complexity and extent of diseased cellular structure, can hardly be surpassed in the bottles of any surgical museum. It is a beautiful case, and being a military specimen, it reminds us of that early piece of intricacy set by Gordius, king of Phrygia, to Alexander, and which was so hastily marred by the conqueror's sword. Masterful natures are apt to make short work of red-tape entanglements.

Another variety of the red-tape disease consists in words, phrases, functions, and ceremonial observances out of which the spirit has fled, or the understanding, or both. Our ordinary social life is largely built on structures of this material, as cities stand on vast thicknesses of chalk composed of the deserted habitations of countless myriads of tiny creatures long deceased. Our words are sepulchres. We cannot name the days of the week, or 'consider the heavens,' or buy an ounce of spirit of camphor, without treading on the graves of thoughts. But in such cases all the offensiveness of decay is gone, and the gentle wash of the tides of Time during many centuries has converted the products of decay into a pure and beneficent substance. But a nearer approach to the dissolution of thought and the giving up of the ghost by words is not so agreeable. A Hampshire vicar assured his readers some years ago that the well-known marriage service of the Church of England as uttered by his brides and bridegrooms exhibited curious deterioration. One of the sentences which Edwin has to utter was quite commonly rendered thus: 'With my body I thee wash up, and with all my worldly goods I thee and thou,' which was matched, and even exceeded, by Emma's variations of her part, in promising to

take her husband 'to 'ave and to 'old from this day forth, for betterer horse, for richer power, in siggerness else, to love cherries and a bay.'

Edwin and Emma knew they were being married, and that this marvellous coil of red-tape was somehow a necessary part of the function; but the attempt to explain how and why would have smitten them with paralysis. The distorted sentences, texts, hymns, thus repeated by thousands of good and simple souls daily would stagger us if statistics could be obtained.

Child-piety is a beautiful and simple thing, and is often in danger of being throttled by red-tape; but generally is lissome and buoyant enough to escape. In what sweet freedom of all meaning the scallop of a child's soul will dance over a sea of words, neither knowing nor caring for the profundities below. We confess it more frequently moves us to laughter than to grief, knowing that the real spring of child-piety does not lie in those twilight deeps where swim the solemn shadowy forms of the Fathers, the Divines, the Scholiasts, and the Commentators. Captivating specimens might easily be given as illustrations, but collections of them are so frequently going the round of the press that it is scarcely worth while. That it is not children only who are ready to gabble words without meaning, if they are supposed to be part of a function, was finely shown by the parish clerk's version of a notice entrusted to him by his minister. The notice was this: 'On Sunday next the service in this church will be held in the afternoon, and on the following Sunday in the morning, and so on alternately until further notice.' What really greeted the ears of the congregation was this version of the minister's message: 'On Sunday next the morning service in this church will be held in the afternoon; and on the following Sunday, the afternoon service will be held in the morning, and so on to all eternity.' The children may now make their bow to the parish clerk, and present to him the fool's cap with festoons of red-tape.

We conclude with that variety of red-tapeism which consists in the conservation of decrees, orders, customs, ceremonies, from which the *raison d'être* has perished, as the snails out of the dry snail-shells that roll about chalk downs. Even the dog is subject to this complaint when he turns round three times before lying down because his ancestors did so to make a bed in the long prairie-grass. 'Leave your stick, sir,' said a doorkeeper to a gentleman who was passing into an Exhibition.—'But I haven't got a stick,' the visitor replied.—'Then you must go and buy one; the orders is as every gentleman is to leave his stick.' The well-known instances of the two Russian sentinels are in point here. One stood at the entrance of a passage and cried, 'Keep to the left!' the other mounted guard in the middle of a grass plot. The origin of the first regulation was traced back, through a generation, to an occasion when the right wall of the passage had been painted; and the second sentinel quite unconsciously commemorated the advent, in a previous century, of an unexpected little snow-draw which charmed the Empress of that day, and was ordered to be guarded.

How stupid people can be if they try was illustrated by a circumstance mentioned to the

writer by a superintendent town missionary. He asked an army chaplain whether he ever spoke to the soldiers privately about their souls.—'No.'—'Why?'—'Because a chaplain is an officer, and the rule of the service is that an officer cannot speak to a private soldier except in the presence of a non-commissioned officer.'

What has Nature to teach us about red-tape? Well, having vilipended red-tape through all the foregoing article, we will admit that it has the merits of its defects. It has its uses. Bonds and freedom, steadfastness and progress, constitute a see-saw which we shall never wholly escape, and which has its analogy in the physical world. Automatic action is Nature's red-tape, and we should creep along very slowly without it. A series of voluntary actions result in automatic action, and automatic action is an economy of brain-power. It does occasionally happen that the reason, the final cause, of the action evaporates; but the action being automatic, is continued. This is Nature's red-tape. But she forthwith sets about the correction of the useless function, as the history of the divergence of species proves. It is reserved for man to perpetrate the absurdities and the costly vagaries of offices, sinecures, dresses, customs, from which all use and meaning have perished as wholly as the pious sentiment, 'God encompasses us,' has perished out of the sign of a metropolitan hotel known as the *Goat and Compasses*.

It is clearly the duty of Society to return dead things to dust as soon as possible, and not to bury them in oak coffins, resisting the kindly influences that make for dissolution. Life, we are told, is the sum of the influences that resist dissolution; there is therefore some life in red-tape, but it is not a wholesome life. Where a creed or custom is dead, call in the burying-beetles, and let them forthwith undermine it and inter it. It is dreadful that a thing be kept alive by red-tape after it is dead, like that wretched man in Poe's tale who was mesmerised *in articulo mortis*, and, when at last released, fell into the crumbling relics of a death of long-ago. We do not advocate cremation. There are always some devotees whose feelings would be harrowed by the visible smoke and flame; but do not deliberately obstruct dissolution. 'Earth to earth, ashes to ashes.' It is only worthless creatures like subscribers to magazines or newspapers who promise to pay up 'next Tuesday week if they are alive,' and, failing to fulfil their promise, must be dead, but are subsequently seen walking about, to save funeral expenses.

JOHN VALE'S GUARDIAN.

CHAPTER XXIX.

WE must go back a step or two to find out exactly what had happened. Isaiah in his new-found prosperity was not unmindful of old acquaintances. Motives were mixed with Isaiah, as they are with most people, and though he would never have dropped the Vignes under any conditions while circumstances put them within his reach, he was all the better pleased and the more willing to visit them when he could drive to their door in a two-horse brake of his own, and could pre-

sent himself before them stiff and shining in unaccustomed broadcloth.

The Vignes had gone to live, as necessity bade them, near the great establishment in which Monsieur had found employment. It was a grimy, dirty, and smoke-darkened district, and as little like their last abiding-place as it well could be. They were placed in the centre of a straggling street a mile long or thereabouts, where every here and there an unkempt field broke the line of houses, and left open to the eye an expanse of country dotted with pit-stacks and heaped with mounds of refuse. The mud of the street was black with coal-dust, the very brickwork of the houses was sodden with old smoke. Day and night, and winter and summer, a pall of smoke hung over the land, and a feeble haze of blue was a midsummer day's dream.

Vigne went to his new employment with excellent testimonials, and made better money there than he had ever earned before, so that the ugliness of his surroundings was not without compensation. He was in the midst of a French colony, too, and in that portion of the street in which he lived his native language was more commonly to be heard than English. Madame had taken upon herself the household arrangements, and had created a cheerful home over an undertaker's shop. Thither, on the afternoon on which Snelling sat waiting in the hovel at the top of that disastrous shaft of his, drove Isaiah, in the brand-new brake and the brand-new raiment behind the pair of horses, not too well assured in point of size, colour, or style, but glorious to their owner's eyes. The undertaker received Isaiah with respect, and sent out a boy to lead the equipage up and down, to prevent the horses from catching cold, whilst the visitor mounted to Madame Vigne's apartments. The good lady, who was already attired as if for a journey, gave Isaiah a cordial welcome.

'I shall tell you one thing, Mr Vintare,' she said, laying a hand on each broadclothed shoulder. 'I have seen Achille, and he has told me that to go to your new house you can pass by my boy. The road is only a little longer. Do, please, pass by my boy. I will not trouble you more than that. I will not want to see him or to speak to him; but let me go by where he lives. That shall content me altogether, because when I think of him he will not any longer be in no place. I shall have a place to put him in when he comes into my mind. He is often in my mind,' said the good creature, emotionally, 'for Anatole and I we have no children.'

'All right, mum,' responded Isaiah. 'It's only two or three hundred yards out of the way, and with a pair o' steppers like them, two or three hundred yards ain't much. Come and look at 'em.' He waved Madame to the window, and pointed a finger towards the muddy street. 'Look at that brace o' steppers, mum; ain't they prime?'

Madame, who had no notion as to what Isaiah was pointing at, lifted her eyebrows and laid the palms of her hands together in pure complaisance.

'I bought that pair of hosses, mum,' said Isaiah, 'for sixty-five guineas, money down, and throwed in a very old dogcart as the hoss-dealer took a fancy to. Call it seventy pound, and tell me it's a bargain; and if you can't say so in your heart of hearts, you're no judge of hoss-flesh.'

Madame being thus enlightened as to the identity of the pair of steppers, acknowledged their excellence volubly with her hands in the air. 'Ah, Mr Vintare, you have prospered.'

'Yes, I have, mum,' said Isaiah. 'And I'm humbly and respectfully thankful for it.'

'You will not forget my boy because you are rich?' she said, searching for a handkerchief to wipe her eyes.

'I don't think he'll grow up to forget me,' Isaiah answered. 'He'll be one of the richest men for miles and miles round before he's one-and-twenty. I shall have no temptation to forget Master John. Apart from which, I've got a kindness for him.'

'Oho!' said Madame, with her hands in the air again, 'you nice, dear, stupid, English people, who will sooner die than say you love anything. Come along to the pair of steppers; I am quite ready.'

Isaiah opened the door and led the way downstairs into the street. Two or three dozen slatternly women with babies had come out to see the show, and looked on whilst Madame mounted and bestowed about herself the plenteous supply of rugs with which the vehicle was provided. Isaiah assumed the reins, gave a crack of the whip, and drove away.

The purpose of his visit to Madame Vigne was to introduce that excellent person to his wife. Mrs Winter had heard much from her husband of Madame's virtues, and was, as a natural consequence, rather ill disposed to her. She had on several occasions flatly declined to encounter Madame; but had, unfortunately for herself, based her sole objection on the ground that the lady was a foreigneering Papist. This fgment having been dissipated by the vicar, whose authority was of course beyond dispute, Mrs Winter was left without defences, and was compelled, though sorely against her will, to accept the visit.

She had her compensations in the fact that she was by this time inhabiting a house which by its splendours could do little less than crush the female invader who ventured on her territory. Isaiah had always been a solid man, and within his own limits was intensely respectable, so that when his circumstances enabled him to do justice to his own conceptions, he furnished his house in a solid and intensely respectable way. He bought the stickiest and shiniest mahogany to be had for love or money, and had it upholstered in the stiffest and most uncompromising horse-hair, a stuff that would be glacial even in the summer-time, and penitential all the year round. The carpets and wall-papers were of the brightest patterns. There was a chest of drawers of brass-fitted mahogany in every room of the house; and in the drawing-room there was a rosewood pianoforte with a surface like that of court-plaster. Nobody in the house could play upon it, and that, considering the internal quality of the instrument, was perhaps rather a blessing than otherwise. Everything was rigidly and exquisitely uncomfortable, and Mrs Winter and her husband were proud in proportion to the distress their new surroundings gave them.

'You will not forget,' said Madame, belying a finger on Isaiah's arm when they were once clear of houses and had come upon the open country—'you will not forget to pass my boy's house.'

'No,' said Isaiah; 'I shan't forget. As a matter of fact, I've never done it yet, because I don't want to look like bragging over him. He given me the sack only a few months ago, and here I be as well to do as he is, or anyhow as well to do as I want. I've had good-luck, and he's had bad; and if I was to drive by him too often with a turn-out like this, he might tek it into his head as I was bouncing.—I don't care,' pursued Isaiah, with a defiant crack of the whip, 'what Bob Snelling teks it into his head to think about me; but I'll tek care, and jolly good care too, as he has no right to it.'

The afternoon shadows were growing deep already as they bowled along the smooth and well-kept country road. 'We're comin' to it,' said Isaiah in a while. 'It's the next house round the corner on the right-hand side. I'll slow down a bit, so as you can get a good look at it. Master John won't be at home yet a while, because the gaffer's sent him to school in Birmingham. He goes to the Grammar-school there, and wears a mortar-board atop of his head, like a parson. It's half-past five before he's at home, because he has to catch the train, and it's a mile from here to the railway station.—Look there; that's his bedroom.—No; not up-stairs; on the ground-floor. I used to sleep i' the same room afore Bob Snelling given me the sack.—He thought,' said Isaiah, lowering his voice, 'that he was going to hurt me when he did that; but if he'd never done it, it might ha' been many and many a bright thousand in his pocket.'

Isaiah's new house was within half a mile of Farmer Shorthouse's residence. Tea was laid out in lonely splendour in the arctic parlour, which even the generous coal-fire could not warm. But if it failed in that direction, it succeeded admirably in another, and brought out the odours of French-polish to perfection. Mrs Winter was pilloried in a stiff black silk, and was on such terms of ceremony with her visitor that no overtures of foreign good-nature could make a passage beyond her intrenchments. Isaiah nudged, frowned, and nodded, and once or twice offered a stage direction in a stage whisper: 'Brisk up a little bit, missus; don't spread the company-manner too thick.'

Madame's visit under these conditions was not likely to be prolonged. The hostess's best approach to geniality was made when she appraised the furniture. 'We warn't brought up to it,' she explained to her guest; 'and I doubt whether Providence will tek it kindly. I've no mind for show myself; but our Isaiah is a man as'll have his way anywhere, and allays would. It's his doings, and I humbly hope as worldly pride may not have a fall.'

'My boy will be at home by this time,' said Madame, when the chilling function was once more seated in the brake behind Isaiah. 'Let me see the house while he is in it; it will be more home-like then.'

Isaiah, anxious to atone for the cold magnificence of Madame's reception, assented willingly. 'It's pitch-dark now,' he answered, 'and the gaffer can think nothing of my driving by.'

A thin snow was in the air, and Madame Vigne veiled herself from it until Isaiah pulled his horses to a walk and touched her with the butt

of his whip. 'Theer,' he said—'theer's a light in his window.—Why, theer's Master John his very self!—Look! D'ye see him? He's pulling up the window.'

In effect Master John was there, in a glow of lamplight. He wore the college cap of which Isaiah had spoken, and a broad white collar over his jacket, and looked remarkably trim and healthy. He had opened the window, and had laid a hand on each of the outer shutters, when Madame called out to him: 'John, my dear!'

'Who's there?' he asked, peering into the darkness. The lamp of the brake gleamed redly through the winter mist, but he could see nothing beyond.

'You know me,' said Madame in an eager whisper. 'Come for a moment. Give me one kiss, and I will go.'

John climbed out at the casement, drew down the window, closed the shutters from without, and ran on tiptoe into the road. A minute later, he had climbed into the brake, and they were hugging each other to their hearts' content.

'Where are you going, Isaiah?' John asked in a hushed and cautious voice.

'I'm driving her home,' said Isaiah, with a jerk of his elbow to intimate Madame. 'It's rather better than five mile.'

'You'll drive back again, won't you?' said John. 'It won't take much more than an hour to do it with those horses. Uncle isn't at home, and he wouldn't mind much if he were. Let me go with you.'

Madame hugged him anew for the suggestion, and immediately began to pack her rugs about him. Isaiah, well pleased, whipped up the horses; and away they all three rolled together, Madame, prodigal of affection, with a fat and comfortable arm round her protégé's neck.

All this time, Mr Orme, sitting neglected and alone in the back kitchen, awaited Snelling's return. Once or twice the housekeeper passed through and treated him to an indignant sniff, at which the meek Tobias curled one foot round the other, and set his thumbs twirling in a feeble appeal against her judgment. She obeyed her master's orders, and set a copious jug of table beer and a joint of cold meat before the visitor. The plentiful good cheer and the fire atoned for ennui for an hour or two; but after a time, Tobias began to weary. The hours of waiting dragged more and more as the day went on, and he began to think himself altogether forgotten. Somewhere about three or four o'clock in the afternoon he fell asleep and allowed the fire to go out. When he awoke the room was dark as pitch, and he was chilled to the marrow. For the first minute or two he failed to remember where he was, and went groping about in some terror before he identified his surroundings. Even when he had done so, he had insane fears lest he had somehow been decoyed into confinement and left to perish.

In the course of his gropings he came upon the handle of the door, and found, to his relief, that there was at least no obstacle of escape. The house was silent as the grave; but the stillness hummed in his ears with a dreadful and disturbing noise. The door he had opened led upon a corridor which ran the whole length of the rear of the house. At the far end of this corridor

shone two distinct rays of light, one beaming apparently through a keyhole, and the other through a crack between the matted flooring and the bottom of a door. Tobias, with stealthy footstep and hands outstretched on either side, approached these friendly signs and listened. There was not a sound of life within; but he saw that the door was off the latch.

'If you please,' he murmured, and tapped humbly with a single knuckle. There came no response in answer, and he tapped again. Then he thought he heard within the murmur of a voice whispering in a peculiarly level and monotonous tone. He tapped rather more loudly than before and coughed apologetically. Still there was no answer, and he ventured to push the door a little wider and again to signalise his presence by a cough. A little scared by the continued silence, he pushed the door a trifle wider yet, and slowly and with extreme caution, guiding that fiery nose of his across the lintel, he peeped into the room. Not a soul was there; but to his surprise, the sound of the level and monotonous whisper still went on. After a moment's wonder, he traced this noise to the lamp, which kept up an unintermittent hissing as it burned. Tobias's nerves had never been of the best this thirty years, and he was shaken now by unusual privations, so that if his heart began to flutter and his blood to twitch and sting at the remote suggestion of a fiery serpent, there was nothing in the world for him to wonder at. A keen, swift travelling wind from some open door was wafted by him, and in a second the fiery serpent flashed into a fiery dragon. In fine, the lamp burst with a hideous shock of noise, and after a second's darkness, the whole room was ablaze with burning oil.

The most hopeful of men could not have expected Tobias to cover one half so quickly as he did the gap and he passed in his retreat. How he found himself in the open air he never knew; but he was at some considerable distance from the house when his lazy wits returned to him. He looked in the direction in which he supposed it to lie, and could discern nothing in the darkness; but as he stood, he heard scream on scream, as if from within the house; and a second later, the same voice calling 'Fire!' in the open air. There were distant shouts in answer; and shortly afterwards a dull glow spread like a red blot upon the blackness of the night, and died away again. It spread itself abroad once more, and grew, second by second, more vivid. Sudden jets and lanes of light began to dash through the red blot hither and thither; and in the intervals of the screaming voice he heard distinctly the crackle of burning wood. Then something which he judged to be the chamber window went with a loud crash and the night was alive with fire. The house was three hundred years old, oak wainscoted, and as dry as tinder.

Tobias turned and ran for dear life, not knowing in what direction he was going.

John and Isaiah had seen Madame safe home, and were returning. They were within a mile of the house, when they came easily to the top of a gentle rise, from which a large extent of country was visible in the daytime.

'I'll get down here, Isaiah,' said John; 'I can

get home in ten minutes, and you can go the nearer way. I don't want uncle to know that we have been together.'

'Hillo!' cried Isaiah suddenly, 'what's that?—That'll be a rick afire.—No; it ain't! There's a window. Look! That's the flash of a window. There it is again! Send I may live, if it ain't Bob Snelling's house!' He dragged John back into the vehicle, and flogged his horses to a furious pace. 'I can tell him as I give you a lift,' he shouted to John, ' afore I saw the fire. He can find no harm in that at such a moment.'

Three or four minutes found them in front of the burning house. The housekeeper was in hysterics in the lane, and one or two women from the neighbouring cottages had taken charge of her. Some half-a-dozen loungers in smock-frocks stood about smoking and staring at the fire.

'Where's the gaffer?' roared Isaiah.

'Sam Duke's rode off to fetch him,' one of the loungers answered. 'He's been at the new shaft all day long.'

'Well,' cried Isaiah angrily, 'can't none of you do anything? Isn't there one of you as has got the brains to know as fire don't like water?' He dismounted as he spoke, and marching his team to a field-gate at a little distance, tethered the horses there by the reins and came bustling back again. 'Lend a hand here, lads! There's summat to be done, summat to be saved.'

'What's the use on it, Mr Winter?' one elderly labourer asked him. 'The well's fifty foot deep. It taks two minutes to get a single bucket up.'

Isaiah stared at him for an instant and then nodded. 'It's a pity,' he said sadly, 'to see the old place burn; but that's all there is for it, I reckon.—My blessid!' he cried suddenly, 'there's the books!' Before a man could divine his intention or a hand could be stretched out to arrest him, he was half-way up the path towards the door of the burning house, shielding his face from the fierce heat with both arms as he ran. The door was volleying a red smoke, and he disappeared in the midst of it. John dashed after him with a cry, and stood powerless with fear at the gateway. There was an awful pause, and in the middle of it Snelling rode up with the messenger behind him. He saw young John standing at the gate, and he noticed that no man had an eye for him. Everybody was staring with fixed and breathless interest towards the door; and as he followed the general gaze, a figure came plunging through the volleying smoke and staggered down the pathway.

The handful of onlookers raised a husky cheer; and Isaiah, clinging to the gate, gave himself over to an heroic fit of coughing and sneezing.

'What's this?' demanded Snelling in a tone of wonder. 'What brought him there?'

'That's thee, is it, old un?' said Isaiah, recognising the voice and looking up with streaming eyes. 'I just happened to be passing. They told me you wasn't wile. I call, and I happened to bethink myself of the books, so I just went in and fetched 'em. Here's the deed-box and cash-box into the bargain.'

Snelling dismounted slowly. 'I was a bit of a fool, I reckon,' he said, 'when I quarrelled with a man like thee.'

'Sayest?' said Isaiah, holding out his hand.

He had risked his life to serve the man, and that meant death to malice.

Snelling took the proffered hand and wrung it hard.

'It was a lamp burst in your neven's bedroom, so they sayin', Mr Snelling,' said one of the bystanders.

'Ay, ay!' he answered; 'so I'm told.'

The boy was there still, and he himself was houseless by his own vile handiwork.

ROSE LEGENDS.

THAT the rose is queen among the flowers there can be no shadow of doubt, if we consider the amount of attention it has received in the past, and especially of late years. From the traditional period when, quite thornless,

High in Paradise,

By the four rivers, the first roses blow,

to the last exhibition of the National Rose Society, it has been in favour, and it now reigns supreme as crowned Empress of the fairest State in all the world. Whether it be the wild-brier of the simplest sort, as it luxuriates in the hedgerow; whether it be a more favoured variety revelling on some southern wall, and doing so with careless ease; or whether it be of the foreign kind, that after years of care doth 'down the alleys shine afar:' in either case, all less endowed or less attended blooms serve as accessories to lend the beauty of completeness to the scene.

Now the rose has some 'virtue to boast,' as Dr Watts put it, 'above all the flowers of the field,' or it could not have found so large a space in early legends as it has done. Saints Ambrose and Basil inform us that it had no drawback from its virtues in Eden; and Milton, following in their wake, describes the garden as being stored with

Flowers of all hue, and without thorn the rose.

Harpocrates, the secret-keeper, was bribed to silence with a rose; and Robert Browning had in his mind the legend when, in *Isobel's Child*, he used the phrase, 'Red as a rose of Harpocrate.' If, however, Sir John Mandeville were an authority on this matter of colour, the redness had a much later origin than the time of Harpocrates, for the author of the *Voyage and Travail* tells us that a Jewish maid of Bethlehem was beloved by a man named Hamuel, a brutish sot. She rejected his suit; and he, in revenge, accused the maiden of offences for which she was condemned to be burned alive. She was brought to the stake; but, by a miracle, the flames burned her accuser to a cinder, and did her no harm. The fagots by which she was surrounded became a garden of roses, the burning brands becoming red ones, and those that were not kindled becoming white ones.

Quite a different origin is given for the colour of the yellow variety. Mussulman tradition accounts for it in a very simple way. It says that when Mohammed was journeying from earth to Paradise, the drops of sweat which fell on the earth from the forehead of the Prophet became white roses; but that the drops of sweat which fell from Al Borak, the animal

on which he rode, became yellow roses. We must not lay much stress upon the tradition, for yellow roses did not come even from the land of the Prophet of Islam, but from Germany. Historic doubts, however, apart, it is pleasant to be told that this flower was sacred to Eros and Aphrodite, to Cupid and Venus, and was an emblem not only of joy and love, but a symbol also of prudence.

The doubtfulness of legend in this matter is of small moment when we come to consider that the rose has a history which goes a long way farther back than some of the traditions themselves. It was well known to the ancient Greeks and Romans. Herodotus, for instance, writes of roses in the garden of Midas, the son of Gordius, in Phrygia, that had sixty leaves, which grew of themselves, and had a more agreeable fragrance than all the rest. The Centifolia is said to have been existent with the Greeks, and a great favourite, not only for its beauty of form but also for its perfume. At feasts, the roses were lavishly used by both the Greeks and the Romans. Fabulous sums were spent to have them at all seasons. In the time of the Republic, the people had their cups of Falerian wine swimming with blooms; and the Spartan soldiers after the battle of Cirrha refused to drink any wine that was not perfumed with roses; while at the Regatta of Baia, the whole surface of the Luerine lake was strewn with the flowers. Nero at his banquetings showered rose-water upon his guests from a hole in the ceiling; and when he honoured the house of a noble with his presence, the host was compelled to have his fountains playing rose-water. Indeed, on such occasions the ground was covered with rose-leaves, garlands of the flowers decorated the brows and necks of the guests, and a rose-pudding found a place in the repast itself. The Sybarites slept on beds stuffed with rose-leaves; the tyrant Dionysius had his couch filled with them; Verus would travel with a garland on his head and round his neck, and over his litter he had a thin net with rose-leaves intertwined. Antiochus luxuriated upon a bed of blooms even in winter days and nights; and when Cleopatra entertained Antony, she had roses covering the floor to the depth, it is said, of an ell. We are told that Heliogabalus supplied so many at one of his banquets that several of his guests were suffocated in the endeavour to extricate themselves from the abundance; he drank rose-wine to help digestion; he bathed in the same sort of liquid; and he had the public swimming-baths filled with the wine of the rose. No wonder the ancients became unwell after breathing and eating and drinking and wearing and reclining on and walking over the fragrant flowers. But the worst of it was that when they became ill, they were given a rose-draught; and no matter what the ailment was, the same thing was prescribed in some form or other. Oftener than not, the poor patient would succumb under the delicious treatment, and he would cease from living in consequence of a ruined digestion arising from a surfeit of sweets,

Of quick effluvia darting through the brain,
Die of a rose in aromatic pain.

Doubtless, the immoderate use of roses by the ancients led in after-days to their being relegated

to their proper sphere in the garden; for although we have had the Wars of the Roses in our modern times, the flowers were only plucked as a symbol. Now, in the garden the rose is about as much at home as it is in poetry. In the garden, there is nothing more charming than the rose in bloom; and in poetry there is no poet worthy of the name who has not consecrated it and enshrined it in his verse. How charmingly this has been done! Let the author of the *Lady of the Lake* speak for them all when he says:

The rose is fairest when 'tis budding new,
And hope is brightest when it dawns from fears;
The rose is sweetest washed with morning dew,
And love is loveliest when embalmed in tears.
O wilding rose, whom fancy thus endears,
I bid your blossoms in my bonnet wave,
Emblem of hope and love through future years!

But the rose is really useful as well as beautiful, despite its misemployment by the ancients, and notwithstanding the artificial character of the course of its development. John Brown of Hadlington, a century and a quarter ago, said: 'Roses in general are delightful to view, agreeable in their smell, and useful in medicine'; and he states that, according to Tournefort, there were fifty-three kinds in his day. The medicinal qualities of the fruit of the rose are well known, for it has time out of mind been considered as an astringent; and Wiseman in his *Surgery* recommends 'fountain-water with rose-water and sugar of roses' as a cooling draught. Rose-vinegar is used for toilet and other purposes, and the conserve of the flowers is held in high esteem as a confection. The chief employment of the bloom, however, is in the manufacture of rose-water and otto of roses.

Rose-water is extensively made in India. At Ghazipore, in Bengal, there are hundreds of acres laid out for the purpose. The harvest is in March and April; and the result of the distillation is to supply about one quart of rose-water from each thousand of the blooms; but adulteration is very much resorted to, oil of sandal-wood being the medium; and the people of India do not seem to mind much whether they get the odour of the rose or the sandal for their money. It is comparatively cheap where it is made, costing two or three shillings a quart, even when unadulterated.

Otto or attar of roses is much more important and expensive. The origin of this condensed perfume is told in one of the romantic stories of the East. It is said that Noorjehan Begum, the favourite wife of Jehan-Geer, was walking in her garden, through which ran a stream of rose-water, when she noticed some oily particles floating on the surface. She had them skimmed off; and their aroma was found to be so delicious, that means were devised to produce the precious essence in a more regular way. The method is an extension of that which is used to produce rose-water, but it takes a thousand trees to supply about two ounces of attar, and its value is seldom less than twenty pounds sterling. At that price, and unadulterated, it is sold mainly to Europeans, while in a less pure form it is vended in the native bazaars. It is bought by the Westermans, however, for manufacturing purposes, and not to be used in its pure condition. Thus, Persius, in his *Elements of Materia Medica and Therapeutics*, declares that 'attar of roses is employed

for scenting only. In the shops, various fumes are sold which owe their odour to the attar. Thus, oil for the hair, sold as *huile antique rouge à la rose*, is merely olive oil coloured by alkanet and scented with the attar. Milk of roses also contains the attar. Several compound scents owe a portion of their fragrance to this oil, as lavender water.' So that Tom Moore, though not literally, was largely correct when he affirmed in his 'Twopenny Post-bag' that

Otto of roses,
Refreshing all noses,

Shall sweetly exhale from our whiskers and wigs.

Extensive rose-farms exist in Turkey, at Adrianople, Brusa, Ushak, and the low countries of the Balkan generally. In the last-mentioned district, seventy thousand ounces of attar are said to be produced in each season, and there it takes two thousand flowers to the drachm! Indeed, the queen of flowers is found in all the temperate parts of the earth, and even in the far north, and it will grow almost anywhere with a little needful care; but those of Cashmere surpass all others for beauty and fragrance. Our roses are bright, and there are roses of other lands which are claimed to be brighter, as, for instance, those of France and Damascus; yet

Who has not heard of the vale of Cashmere,
With its roses the brightest that earth ever gave?

UNDER AN AFRIC SUN.

CHAPTER III.

'Yes, my dear sirs, I cannot conceive a more delightful climate. Winter is unknown, and you can suit your taste by selecting the heat you prefer. Africa down by the sea-shore; Italy where you stand; a few hundred feet higher in the mountains, France; then England; and Norway and its snows at the top of the volcano. A man ought to be happy here.'

'And you are not?' said Fraser dryly.

'No, and yes. Of course, I'm happy in my garden with my child, but— There, hang it all, my dear boys!' he cried, in a good-humoured angry tone, 'how can a man be happy with a load of debt?'

Digby listened, but his eyes were directed to the garden.

'Yes,' continued Redgrave; 'I've been so confoundedly unlucky. Too speculative, perhaps; but I came out here twenty years ago as a speculation, and I'm a stubborn Sussex man, sir: I will not be beaten. But I've got hold of the right thing at last.'

'And what's that?'

'Sulphur, sir. I'm working up that at the top of the mountain. You shall see the place, if you'll come.—Ah, here's Nelly. We never ventured to import a piano, gentlemen; but we have a guitar, and I'll be bound to say if we petition rightly, we shall get a song.'

'Do you wish me to sing, father?' said the girl, colouring slightly as she met Digby's earnest gaze.

'Yes, my dear, if you are not too tired.'

'Oh no, she said hastily; and she crossed the room to reach down a guitar hanging by its ribbon from a nail in the wall.

The two Englishmen had been a fortnight in Isola, and, attractive as the place had proved with its wondrous vegetation, gorge, hill, and crater, Redgrave's pretty half-English villa seemed to be the spot which drew them to it again and again. The days would be passed in penetrating the most out-of-the-way parts of the island and adding to Fraser's collection; then they would return, tired out, to the little *venta*, where their dark-eyed moustached landlady had prepared a substantial meal; after which there would be chocolate and a cigar, followed by: 'I say, Horace, what do you say to a walk up to Redgrave's? He will not see much English society when we are gone.'

Fraser always looked uneasy, hesitated, and seemed on the point of refusing; but he invariably ended by rising to go, till it became almost a matter of course for them to find father and daughter standing by the rough gate between the prickly-pears, Redgrave smoking one of his home-made cigars, and Helen watching with a sadness of expression in her eyes which seemed to grow night by night.

Then there would be more chocolate out there, in the delicious evening, with the scent of orange blossom floating around, and the boom of the great Atlantic billows, softened by the distance, coming up like a bass murmur from far below.

Delicious dreamy evenings, with sea, sky, and shadows of the coming night, and the slowly developing stars, all tending to give an indefinable something to the place, which seemed to hold the visitors as in a thrall.

It had been so night after night, with the only drawback to the pleasure in the presence of Señor Ramon, who seemed to be quite at home at the villa, and polite and friendly, to a degree; but whose warmth never seemed to thaw the two Englishmen.

This night, Ramon was absent at his home, a quarter of a league on the other side of the little port; and as soon as the guitar strings had been tuned, Helen sang first one and then another of the old ballads of home, the room growing darker, and the faces of those present more indistinct, till suddenly Redgrave started up as his child's sweet sympathetic voice ceased, the last note of the guitar vibrating in the fragrant air.

'Room's too hot,' said Redgrave huskily.—

'Come and have a walk round, Fraser.'

'Poor papa!' said Helen, rising as he left the room, followed by Fraser with unwilling step.

'Is anything wrong?' said Digby, laying his hand upon the guitar, as if in protest.

'It was my mother's favourite song,' said Helen sadly. 'She used to sing it. I remembered the air, and found the words one day in her desk. I sang it to him one evening as a surprise, and his emotion frightened me; but ever since he makes me sing it whenever I take down the guitar. He says it brings him back the past; but it always makes him sad.'

There was a few moments' silence, embarrassing to both. Digby had words rising to his lips which he longed to speak; but he checked them, as he felt that he had no right.

'Let us join them now,' said Helen, trying to draw away the guitar.

'No, no; not yet,' cried Digby. 'One more song—will you?—may I ask you? the little Spanish song I heard you singing that day you were gathering flowers.'

Helen drew her breath so sharply that there was a sound in the darkening room as of a painful sob. Then there was silence as Digby sank back in his chair with a feeling of misery crushing down upon him such as he had never felt before.

'I'm an idiot!' he said to himself. 'What business had I ever to harbour such thoughts? But if it had been another, I should not have cared.'

He knew he was thinking a lie as he seemed to start back into consciousness, for the chords of the guitar rang out in a wild half-minor refrain, and before him he could dimly see Helen on the other side of the room, seated opposite the window, while the sweet pure notes thrilled him through and through.

But the song seemed different now. In place of the vivid greenery of the wood, and the face of the singer looking bright, happy, and surprised in the encounter, everything was dark and oppressive; even the song seemed sad, while it was as if a blow had been struck as the last note rang out and a voice from the window cried 'Brava! brava!' with the addition of hearty plaudits.

Digby sprang to his feet with the hot blood in his cheeks.

'Ah, my dear Señor Digby, I did not know you were there.—Is not Helen's voice delicious?'

Digby tried to speak, but bit his lip with rage, for the words would not come; and Ramon continued: 'Come, señor, confess she sings our Spanish songs in a way which throws yours in the shade?'

'Miss Redgrave's singing is a pleasure to hear,' said Digby coldly.—'Shall we join your father in the garden?'

'Thank you, Mr Digby; not this evening,' said Helen, her voice sounding as if it had caught the infection of his.

'But you will come, my dear señor,' said Ramon. 'I have brought you a few of my latest-made cigars.'

In the meantime, Redgrave had led the way up a path through his grounds, followed unwillingly by Fraser, to a seat cut in the steep stone, from which they could gaze right away to sea and over the sleeping town.

'Peak looks well to-night,' said Redgrave, pointing to what seemed like a faint cloud where the last rays of the departed day still lingered. 'It's a beautiful world this—a bad world.'

'Paradoxical,' said Fraser dryly.

'Yes, sir. We spoil it, and make it bad.'

There was a long silence, during which they sat and smoked; and from time to time, faintly heard, came the tinkle of Helen's guitar.

'You have been so friendly to us, Mr Redgrave,' said Fraser at last, 'and you seem so isolated'—

'Yes; this is Isola,' said the other with a half-laugh.

'A stranger among strangers, that I take the liberty of speaking,' continued Fraser, without heeding the interruption. 'You are in trouble?'

'To the very eyes, sir.'

'Can I, as a fellow-countryman, help you?'

'No,' said Redgrave shortly.

'I beg your pardon. I meant well.'

'Of course you did, my dear sir, and I thank you; but you can't help me.—I have two great troubles—debt, and my daughter.'

'A curse—and a blessing,' said Fraser dryly.

'Call it so if you like, sir,' cried Redgrave almost fiercely; 'but I owe that Spanish dog more than I can ever pay him. He has led me on in my foolish desire to speculate, tempting me to borrow of him, as if he were my best friend, and I could not see it. I have no means of proving it; but I feel morally certain that he has used his great influence as the richest man in the island to undermine me in my sales. And now he demands payment in full.'

'Well, sir; pay him.'

'I cannot.'

'You have not the means?'

'Yes, I have; but I cannot pay him.'

'May I ask why?'

'Because he will not take money.'

'What do you mean?'

'What did old Shylock insist upon having?'

'His pound of flesh?'

'Yes. I might borrow and pay him; but he insists upon my daughter's hand.'

'Ha!' ejaculated Fraser, as they sat there in the dark.

'And she hates him'—

There was a pause.

'As much as you, sir.'

'Ha!' ejaculated Fraser again.

'There; come back, and join the young folks, Fraser. I feel better, now some one knows my trouble.—Humph! there he is again.' For Ramon's voice was heard speaking loud enough, and directly after the four men encountered.

That night, Ramon and Redgrave walked part of the way back with the two visitors; and after they had parted, Ramon stopped short.

'Good-night,' said Redgrave.

'No, señor; it is not good-night,' said the Spaniard haughtily. 'How long do those English stay here?'

'I don't know; they are their own masters.'

'Yes, Señor Redgrave; and I am yours.—Their presence here displeases me. Let them go.'

He strode away; and as Redgrave walked slowly back, he struck the palm of his left hand a tremendous blow with his fist and said something English—only one word, but it was very English indeed.

CHAPTER IV.

Another fortnight had passed. Excursions had been made along the shore to where the huge billows thundered in. Digby had mastered his antipathy so far as to allow himself to be let down by a rope in company with Fraser to inspect the mummy caves, where, in the most inaccessible spots, the ancient inhabitants of the island buried their dead; and here Fraser had descended upon facial angles, prognathic jaws, width of cheek-bones, height of forehead, and the like, as he stood before Digby, Hamlet-like, holding an antique skull. Botanical specimens had been procured, geological examples collected, and packed in boxes for transit home; insects had been captured, and duly stuck; and the troglodytes of the island

visited in their cavern villages, where they dwelt dirtily and securely in caves, which were similar to those used in the past by the Guanches as catacombs, being really huge ruptured bubbles formed by volcanic gases in the molten stone, when the great mountain of the interior poured forth in eruption the rock-formed fluid of the interior of the earth. While ever, night after night, as if drawn by a magnet, the two visitors found their way to Redgrave's house, where the master was gravely friendly, as he noted how his child's sad countenance lit up as the familiar footsteps were heard upon the silvery pumice-path.

Ramon raged and stormed. Redgrave forgot his Canary-Spanish education, and grew more English, displaying a bulldog obstinacy.

Then Ramon threatened as he showed his white teeth. 'Mischief may come, my dear Redgrave,' he whispered.

In an instant Redgrave's strong hand gripped him by the shoulder, and his gray eyes flashed fire into the Spaniard's dark orbs. 'Don't try it,' he said fiercely. 'You have an Englishman and a Scot to deal with, sir, and those two together can beat the world, let alone Spain. Read your history, sir, if you don't believe. You Spaniards fight with knives; we Englishmen with our fists. Knives break, fists break too, but they break people's heads. That's metaphorical, Señor Ramon, but there's a good deal of truth in it, all the same. Don't threaten, sir. You've got me down, but I might be dangerous if you tempted me to kick.'

'My dear Redgrave, this is absurd,' said Ramon. 'You misunderstand me. We are the best of friends. I will say no more. We two cannot afford to quarrel. I look upon you as my father, yet to be.'

From that moment Ramon was smiles and good-humour combined. Placid as one of the volcanoes of the island, sleeping and covered by time with grass and flowers, with nothing to tell that they were not pleasant mounds, till a stick was thrust in deeply, and then a faint vapour arose, invisible to the eye, but diffusing an odour of sulphur that was strangely suggestive of heat far down below.

Redgrave was always friendly to the two men, but he made no proposals for trips in the island; he never invited them to come.

'I'll do nothing,' he used to mutter to himself. 'My attempts always fail. I'll leave everything to fate.'

'When are we to have this long-talked-of trip to your works?' said Fraser one evening, when he had been watching angrily the looks which Digby directed at Helen.

'Eh? Ah, when you like,' said Redgrave.

'To-morrow be it then,' said Fraser.

'A trip—a walk?' said Ramon, turning sharply.

'Yes; only to the works.'

'Ah, yes; very interesting.—You will take them to-morrow, Redgrave?'

The latter nodded.

'I wish you a pleasant day.—You will start early, as it is far?'

'Yes. Soon after sunrise.—I shall have everything ready, gentlemen, so be here in good time.'

Ramon smiled to himself as he went away in the best of humour that night, but he smiled too soon.

Redgrave saw it, and he was very thoughtful as he bade his other visitors good-night.

'Nelly, my darling,' he said as they re-entered the house, 'it is very cold up the mountain, and the way there is scorching and dusty; but if I had the side-saddle clapped on one of the mules, you could go with us.'

The sad aspect fled from Helen's face on the instant. 'Ah yes,' she cried.

'That's right,' said her father. 'Then be ready. Thick boots and cloak ready for the cold.'

Helen flung her arms about his neck, and hid her face for a moment in his breast before kissing him and saying 'Good-night.'

'I've seen him smile before,' said Redgrave to himself; 'and it means mischief. As soon as we were out of the way, he would be here pestering my poor girl. Checkmate there.'

'Treacherous enemy at least,' said Ramon, as he returned home.

'Tom,' said Fraser suddenly, as they two walked together down the steep slope.

'Eh? Yes?' said Digby with a start.

'What do you say to getting back to Santa Cruz and trying to catch one of the Castle bouts home?'

'No.'

'Eh?'

'I said No. I'm very bad, out of sorts, Horace; and this place is doing me worlds of good. Emphatically, No. Besides, you have not half-done the island yet. You said so the other day.'

'True: I did.'

'Then do it properly while you are here; and don't bother. Why, you are always wanting to go home.'

Fraser's countenance grew more sad as he gazed sidewise at his companion's happy face, and he sighed gently. 'Young—handsome—volatile,' he said to himself; 'and he loves her dearly; while she'— He seemed to have come upon a confused mental tanglement, and it was some minutes after blindly blundering on through a maze of thought, that he said softly: 'Matters are getting in a knot.'

CHAPTER V.

'Going with us—you!' cried Digby as he entered the pretty room at Redgrave's the next morning, to find a delicious breakfast spread, and Helen standing ready to receive him in a riding-habit specially adapted to the place.

'You will not think me in the way?' she said playfully.

Fraser's countenance looked more sombre as he took the hand extended to him, and smiled sadly as he followed Digby's example and expressed his delight.

To both men that day was a dream of a wondrous journey upward along a flower-strown track towards a dense cloud, which soon after enveloped them, and through which they laboriously climbed to find themselves in a new region, where the air was cooler, and fragrant with the odour of the resinous pines through which they passed; and as Digby led Helen's mule, they talked little, but listened to the music of the birds and the gurgle of water, and caught from time to time among the tree-tops glimpses of the dazzling blue sky. They spoke but seldom, but

went on with their eyes fixed upon Fraser and Redgrave, who led the way some fifty yards ahead, but stopped from time to time, for the laggards to overtake them, and admire some fresh view.

And all through that temperate summer zone the birds sung around them; and to Digby they sang only of love, and to Helen of what might be.

But the sadness in her breast suffused her eyes with tears. There was a black shadow always before her; and when, after riding her mule through some rougher part, Digby turned to seek her gaze, she averted it with a sigh, but to own to herself that all this was very sweet, and she knew that she had never before enjoyed a day like this.

The fir-tree zone came to an end; the cool darkness and soft silence of the shady glade gave place to a rugged pumice-strown desert, where fine dust rose at every step, and the sun poured down with blinding power. A weary, weary tramp to some; but to those two who hung behind, a dreamy time of bliss, through which they journeyed on hour after hour, till a wooden hut was reached, where the mule was tethered; and Fraser now, at Redgrave's suggestion, offered his arm to help Helen up a cindery slope to the edge of the mountain crater, the party then descending a hundred feet or so into a hollow, where Fraser forgot everything but the delight he found in gathering specimens of sulphur crystals—pale straw colour, rich yellow, and brilliant scarlet.

'Yes, this is my last venture,' said Redgrave suddenly. 'My men come up here to dig the sulphur, of which there is no end, store it for me in the tent below, and we ship it off home. But you had better not stay long; the sulphur gas comes up strong to-day.'

'What would happen if there was to be an eruption now, Mr Redgrave?' said Digby.

'This party would never know,' was the serious reply.

'Then I wish to goodness Señor Ramon were here, and this party safe at home, if it did blow up,' said Digby in a half-whisper as he glanced at Helen, who shook her head at him sadly; and he saw her eyes fill with tears.

Fraser was a dozen yards away, stooping to pick up yet another crystal, while Redgrave was walking towards him.

'Forgive me,' whispered Digby. 'They were the words of a thoughtless boy.'

Her look said so much that he caught her hand and raised it to his lips, but only got it to be drawn timidly away.

'Well, Fraser, when you're ready,' said Redgrave. 'It's a long way back; the wind's high; the gases bad, and the dust blows. It's very cold too.—Shall we go back?'

Fraser assented; and Digby gave way to him as he came forward to help Helen to climb up the side of the crater to the edge, whence, after a brief gaze round at the glorious view, they all descended to the hut, and partook of the luncheon they had brought. Helen remounted the mule, and Digby took the bridle once more as her father and Fraser went on.

The first part of the descent took place in silence, both Digby and Helen wondering how it

was that they had not noticed that it was bitterly cold, the wind boisterous, and the dust that rose painful and wearying to a degree. They were conscious of nothing save that they were together in an idyllic dream, with a world of beauty spread out below.

Eight thousand feet, they had been told, was the height of the quiescent volcano; but the words had fallen upon deaf ears, for there was a question asking itself at the portals of their hearts: 'How is this to end?'

The sun was getting low in the west as the pine zone upon the mountain was reached; and once more in the dim obscurity they penetrated, everything seemed more dreamy and sweet than ever.

Fraser and Redgrave were well on ahead; the truck wound here and there; but dim as the woodland became, the mule was familiar with the way, and paced slowly on with its bridle upon its neck, and Digby walking now with his hand upon the saddle-bow.

Darker and darker it grew, save where the ruddy light of the westerling sun pierced the garden pine-boughs, and cast strangely lurid rays through the dense forest. And still darker and darker, till a gurgling stream was reached; the mule stopped of its own accord to bend down and drink, and Digby's hand took that which was near his on the pommel of the saddle.

'Helen!' he said, and his voice was a whisper among the pines.

She did not speak; but her hand was timidly resigned to his grasp, and the next moment his arms were about her. 'My darling!' were his words; 'I love you with all a man's first true love.'

There was no reply, a timid shrinking, and with a sob Helen let her head rest upon his shoulder, as if that were the place where she might find safety from the fate that seemed to her worse than death.

There was a strange grating noise, such as might have been made by a frightened bird, but it was caused by ivory gritting and grinding upon ivory.

Digby started round to see dimly, half-a-dozen yards away, Ramon standing by the bole of one of the thickest pines, while a cheery voice ahead shouted back: 'Come, you people; don't lose your way.'

WILD EXMOOR.

It is sweet at times, when the heart is fretted and weary of the conventionalisms of town-life, to seek solace for even a few fleeting days with Nature in her wild beauty. To quote a great writer: 'Welcome, thou great Nature, savage but not false, not unkind, unmotherly—speak thou to me, O mother, and sing my sick heart thy mystic everlasting lullaby song, and let all the rest be far!'

Moved by the burning desire to quit for a brief while the whirl and glare of the city, I went down last spring to wander on Exmoor. It was April, and the woods and hedges were growing tenderly verdant. The cuckoo's note was not yet heard; while the nightingale, for some mysterious reason, never goes so far west. But thrushes

and blackbirds were singing as they never seem to sing later on; and a host of small birds swelled the chorus, amongst them the willow-wren, whose plaintive note every dweller in the country must know: he, like the cuckoo, is one of spring's chief harbingers.

The drive from South Molton to Simonsbath is very beautiful. For the first two or three miles, the road winds through a hilly and thickly-wooded country—a typical Devonshire road, in fact. A sweet little stream brawls noisily along, generally close to the road, while some rich undulating water-meadows delight the eye. Presently we pass by a disused copper mine, and through a quiet hamlet nestling on the confines of the moor itself. The meadows and birch-woods gradually melt away; and, climbing a steep long hill, we breathe a different air, that makes the pulse beat stronger, and the blood circle more freely in the veins. The Moor proper, in its wild desolation and its absolute silence, now opens out before us. Glancing back, we get a magnificent view of South Molton and its neighbourhood, even to hamlets and villages far remote. But the mists of night draw on apace, and we have yet to drive some half-dozen stiff miles before reaching that snug inn at Simonsbath, the *William Rufus*. The snow still lies thick here and there along the roadside, in huge discoloured patches, grimly suggestive of the severity of the past winter. By-and-by a sudden turn of the road brings us in view of the 'Silver Barle.' At this turn, by the way, there is a horrible precipice, with neither wall nor protection of any kind. To be hurled down that gully would seem certain death; and yet our driver, the honest innkeeper, tells how on a dark night, some years ago, a carriage and pair did actually go over, and with no graver casualty to the occupants than a broken collar-bone. The trap, however, was dashed to pieces, and it was a difficult business to extract the terrified horses.

The sound and sight of devious Barle sends a thrill of joy through us, for we have come to fish in this stream, which abounds in trout, more, perhaps, than any of the other moorland streams; though they run very small—six or eight to the pound. Here and there, a monster of half a pound, or even three-quarters, may be taken with worm or fly.

Simonsbath is a little settlement in the midst of the wilds of Exmoor forest. I am referring to Exmoor proper, and not to the district commonly known by this name, which is of wide extent. This place, with its green plantations and few slight buildings, is a little oasis in a wild but beautiful tract; nor do its simple and scanty signs of civilisation harmonise ill with the desolation around. A church, with a few labourers' cottages, an inn, and picturesque old mansion-house; add to these the fir plantations, that afford a shelter from the winter storms, and you have the civilisation of Exmoor complete. More than one attempt has been made to reclaim the forest. Many years ago, a mansion-house on a far more pretentious scale was commenced, but never completed; there it stands to this day, grim and untenanted, save by the starlings, which build there in the spring. Other attempted improvements have failed in the same way: the peat and heather in hill and dale seem to defy the hand

of man, and his little efforts to rob them of their natural grandeur and obdurate ruggedness are quite futile.

Early in the cold bright morning we were up to fish the Barle as far down as Landacre Bridge, or perhaps to wooded Withypoole. These upper reaches of the stream between Landacre and Simonsbath are undeniably a little monotonous; one continuous brawl over rocks and stones, with none of those deep mysterious pools so delightful to the angler's heart; nor are there any swift smooth 'runs.' At Withypoole, indeed, the Barle alters considerably in aspect, presenting a wide variety of river scenery; deep pools, 'stickles,' and quiet runs. Yet, even at and above Simonsbath, the Barle to my mind is a lovely stream.

It is shining and snowing by fits, and consequently sport is very moderate; but here and there, during the short snow-storms, we pick up a few beautiful troutlets, that rise fearlessly to the fly, a 'March Brown' or 'Blue Upright.' My companions stride on far ahead, leaving me a mile or so of river to fish. But the rise is very slight; for there is no sign as yet of the natural fly on the water, nor is the wind in the right quarter. Nevertheless, left to myself, I find plenty of solace. Passing an old disused copper mine—there are many hereabouts—the place straightway becomes a mine of memories. A solitary shepherd's cottage stands on the hillside within a stone's throw, and here, years back, I recollect as if it were but yesterday asking for a glass of milk. It was a blazing day in August, and I had been fishing the Barle with a college friend from its source to Landacre. The time in those Oxford days was very sunny, for the mists of disappointment and sorrow were as yet afar. Often enough in the intervening years I have longed to revisit Exmoor, and at length, my wish fulfilled, find that the place has lost none of its former fascination. The loneliness of its hills and valleys does not depress me; on the contrary, my spirits are elevated, for the moors seem to contain an elixir of life.

The heather is always beautiful, even before summer, with her lavish hand, has made the hill-sides purple with it, and the stream is ever a companion. At this time of year there is, of course, a scarcity of animal life. A few stone-chats and wheatears, just arrived, chatter and flirt their tails amidst the rocks; and the dipper or water-ousel forces attention by persistently courtesying to you from a boulder in mid-stream. He is a delightful fellow, this dipper, full of quaint sly ways; and by sitting quite still and watching, you may soon learn the ins and outs of his life. He comes and goes briskly from rock to rock, courtesying from every one, and uttering now and then a clear shrill whistle. I have often thought on the contrast between the modes in which man and the lower animals feed. The former has for the most part his stated hours for feeding, and partakes of his food with more or less punctuality. Take, on the other hand, the dipper—he has scarcely a spare moment while there is light, but is continuously seeking for food, earning his bread by the constant sweat of his brow.

Snipe, curlews, and partridges are fairly common on the moors; and that local bird the blackcock is plentiful in the neighbourhood of the Doone

Valley. This year, I saw on Exmoor a species whose presence I had never suspected till then, the ring-ousel, which is also a very local species. Rabbits are plentiful, and, as a consequence, stoats and weasels. Herds of Exmoor ponies run wild; and in the Bagworthy Valley and neighbourhood you may sometimes see that grand animal, the wild red-deer.

There are three streams all rising hard by Simonsbath—the Barle, the Exe, and Bagworthy Water: the last-named, which flows through the Bagworthy Valley, is perhaps the most beautiful; but then, after passing Doone Valley and the idyllic 'waterslide'—rendered classic ground by Blackmore in his *Lorna Doone*—the scenery changes entirely: the wild and treeless moors disappear, and the stream uniting with the Lyn, flows on to the Severn sea through scenes, it is true, of surpassing loveliness, but lacking the stern grandeur of the moorland: past Brendon village, and past Watersmeet, the scene in Whyte Melville's *Katerfelto* of the fierce struggle between Parson Gale and John Garnet: on to Woodside cottage and Lynmouth village, where, as Southey said, the river and the sea 'make but one sound!' Very tender memories these places have for me; but it is to Exmoor I would go when weary for a while of the sounds and sights of city life. A gracious and soothing silence broods over hill and valley, broken only here and there by the brawling of silvery trout stream, and sometimes in the summer by the thunder echoing from hill to hill.

IRONICAL ITEMS.

A CRITIC called irony the wit of a thinker, and humour the irony of a poet. He further likened irony to the sting of a thorn, and humour to the plaster which heals the wound. Irony, like sarcasm and ridicule, is often more effective than argument; in description, is sometimes very telling; and may convey suggestions and ideas in a terse and pithy manner, as when one says: 'You can't always judge by appearances: the man who wears a diamond pin may be really wealthy.' A witty Frenchman writes in a Paris newspaper that a French major is a man who has three decorations: the third was given him because he had two, the second because he had one, and the first because he had none. A well-known cardinal says a gentleman is one who never inflicts pain. On which a wit remarks: 'This is hard on the dentists.'

Not a bad story is told of an aged clergyman who met a man loudly declaiming against foreign missions. 'Why,' asked the objector, 'doesn't the Church look after the heathen at home?'—'We do,' said the clergyman quietly, and gave the man a tract.

'What's going on inside?' inquired a gentleman of the ticket-seller at the entrance to a public hall.—'An amateur performance,' replied the latter.—'The audience seem to be having a good time; I heard their shouts of laughter four blocks away. What's the play?'—'*Hamlet*,' was the unexpected reply.

The slowness or unpunctuality of trains is a fertile topic for wits to exercise their powers thereon. A man was waiting once for the train

at a roadside station where passengers at times have to test greatly their stock of patience. He saw a graveyard not far from the station very full of graves, and he inquired the reason. A bystander calmly informed him that it was used to bury passengers who died while waiting for the train. Stations and trains bring to mind the Mugby Junction style of sandwiches, which have roused the wrathful irony and sarcasm of so many travellers. It is stated that a ham sandwich has been dug out of the ruins of Pompeii in a perfect state of preservation. When tasted, it was pronounced to be very similar to those to be got at the railway refreshment rooms.

'That was a mysterious robbery the other day,' said Smith to Jones.—'Why, I don't see what mystery there was about it,' remarked Jones; 'the detectives caught the thieves the same day.'—'Yes,' returned the first speaker; 'that's what I said.'

'So far as you saw,' said a counsel to a witness, 'she was doing her ordinary household duty?'—'I should say so—she was talking,' was the ironical reply. A woman's weakness for talking, and her helplessness in the little matters of directing missiles and pointing lead pencils, form never-failing subjects of ridicule for the rougher sex.

'He never had but one genuine case in his life,' said a lawyer of a rival, 'and that was when he prosecuted his studies.'—Some lawyers have had curious experiences of ironical wills. There is the not unfamiliar case of the French merchant who left a handsome legacy to a lady who had refused to marry him twenty years before, in gratitude for her kindness in not taking him at his word.

There is a good deal of pointed satire in such ironical facetiae as the following. We are reminded that the mania for adulteration is so great, that you can buy a quart of sand and be sure that it is not half sugar.—A resident in a suburban villa was recently asked how his house had fared during a snowstorm. 'Oh, badly,' was the reply; 'my cistern is the only dry place in it.'—Some good wholesome advice may thus be conveyed to careless householders. They will please note that the most effectual method of discovering a gas-escape on their premises is to hunt for it by the light of a naked candle until they find it.—'What would civilisation be without a piano?' asked a philosopher. 'Among other things, it would be able to sleep at nights, besides being a thoughtless unhappy by day,' replied a writer.—'Wot'll I do with this burglar alarm, Bill: take it along?' asks burglar number one. Second burglar: 'Yes; slip it in the bag; we can get something for it.'—'I have called on the recommendation of a friend,' said a gentleman, 'to have my portrait painted. But I should like to know if you can take me in my fur coat?' 'Oh, certainly,' replied the artist. 'Fact is, you know, I am an animal painter.'

Irony has a good share in women's spiteful little speeches about one another. These remarks were exchanged between two friends: 'Do you know that little Mrs D—— pretends to be a collector of antiquities? You don't believe she really has any, do you?'—'Oh yes; her certificate of birth, to begin with,' was the ironical remark.

Ungallant comments upon the fair sex furnish many ironical items. As the majority of humor-

ous press-writers are, as A. Ward would say, of the male persuasion, it gives them daily opportunities of making sly hits of this description without much chance of retaliation. A writer has noticed that nothing makes a woman laugh so much as a new set of teeth. Six women can talk all at once and get along first-rate, and no two men can do that. A woman can throw a stone with a curve that would be a fortune to a bowl-player. Woman's greatest glory is her hair, and she should be very economical of it, says a cynic, when she is cooking. But the women do not always come off second best. A lady stood hanging on to the strap of a tramcar, when a workman in the far corner arose and politely offered her his seat. 'I thank you,' she said in a very sweet tone; 'but I dislike to deprive the only gentleman in the car of his seat.'

The troubles of matrimony are a never-failing subject for the fellow of infinite jest who exercises his wit in the following fashion. 'Joy never kills,' remarked Dobbin's mother-in-law to him the other morning. 'Possibly not,' he replied quietly; 'but please don't experiment on me by going elsewhere to live.'—When you see a couple in the street, if the man carries the bundles, they are engaged; if the woman carries the bundles, they are married.

THE CIVILISED BURMAN.

THE native inhabitants of the larger Burmese towns include amongst their number a considerable proportion of what, in contradistinction to the more ignorant jungle-folk, may be called 'civilised' Burnans, whose intercourse with Europeans naturally does much towards shaping the destinies of the rising generation. An English education is the stepping-stone to advancement in that country, as it is in all our dependencies. No one is more alive to this than the ambitious young Burman, who therefore regards his entry at an English school and introduction to 'A B C' as the first rung of the ladder by which he is to climb to success. Success to him does not imply wealth, for he seems not to appreciate the value of money, as do other eastern races. If a trader makes a big coup over a transaction in timber or paddy, no matter how much elaborate care and thought have been bestowed on the business to bring it to an issue, he spends the profits as soon as they come into his hands, without an idea of laying them up for the proverbial rainy-day. He builds a monastery or pagoda, or adds another to the innumerable rest-houses to be found upon every roadside in Burma. Such application of his means ensures him the respect of his friends in this world, and an easy conscience wherewith to start upon his journey to the next.

Vanity is the keynote to the Burmese character, and a fond parent despatches his son to the care of a school in Rangoon, or even to a college in Calcutta, reminding him of the 'government situation' which is the bright horizon to his career at school. To the youthful Burmese mind government employ conveys a vague meaning of authority and power; and without any idea of the special department of state in which he would prefer to exercise his talents, he embarks on the voyage of life, having before him a silver but

misty cloud whose shades veil appointments not extravagantly paid, but which guarantee to the holder the deference and obsequious civility of all around him.

Prior to his admission to the English school, he has received at the Phoongyee's hands the customary teaching in his mother-tongue. Once settled down, the boy leads much the same existence as a lad at one of our own large middle-class schools. He learns his lessons, or leaves them unlearned to make acquaintance with the cane; gets into scrapes in class and out of class; helps himself to the neighbours' mangoes, and learns to play football. How he does the latter with his bare feet would astonish a Rugbeian. Sometimes he does wear boots, but they clog his movements, and unless he is playing with English or Eurasian boys, he soon discards them, and punishes the leather unflinchingly with his upturned toes. I have never been able to discover what 'rules' they play in Burma. They resemble those of Eton more than any others, with the marked difference, that it appears quite allowable to pick up the ball by the lace and give any opponent within reach a whack over the head with it.

The student remains at school for five or six years, and emerges from its gates with a good sound knowledge of English, reading, writing, and arithmetic. If he does not intend to try the examinations which would decide his fitness for government service, his tutor supplies him with recommendations to assist him in finding the employment his accomplishments qualify him to seek in business or trade.

Perhaps his friends have 'interest,' and are able to get him some subordinate post in the public service which fulfils the object of his ambition without entailing the toils of competitive test for a higher appointment. But whether he becomes a government official through influence or his own merits does not affect the great reality, that he is thenceforth a social centre in his own small world. He can assume those airs of superiority the conceited Burman so loves to wear, accepting with gracious condescension the respectful flattery of his neighbours. He is expected to pose as a magnate, and it is not his nature to disappoint his friends in this. What a grand thing it is, to be sure! To sit in an English chair under a punkah—it looks well to have a punkah irrespective of the state of the thermometer—and listen with dignified attention to the reports of subordinates, who kneel round in ostentatious humility with carefully hidden feet. To receive in their presence big official-looking envelopes from the *chuprassies*, whose coloured belts and brasses like oval door-plates proclaim the source of their important errands. To walk home through the streets in English shoes and socks, in which he is painfully cramped and awkward, whilst the children make way for him, and their parents stand hoping for the distinction his smile of recognition will confer. No wonder the Burman's earthly paradise is officialdom. He is intimate with the English Assistant-commissioner; when the Deputy-commissioner of the district makes his periodical visit, the native official is by virtue of his position the mouthpiece and responsible spokesman of his neighbours. For him, too, there is the chance of presentation

to the Lord Chief-commissioner on some great occasion at Rangoon Government House, when, dressed in the whitest of cotton jackets and the stiffest of gaudy silk *putsoes*, he will be commended by the chief of the province as that trustworthy and deserving officer, the Myooke of Kyouk-choungyee, or some other jungle-place with a name as musical as it is unknown. This presentation, taking place as it does before all the English ladies and gentlemen, as well as his fellow-officials, is an event to be remembered and talked about; and the simple village folk are awed by the sight to which their distinguished friend has flown.

There is, moreover, another possibility before the diligent native officer—far away, indeed, and so beautiful that he can hardly think of it save as a dream—a Decoration! He knows at least one Burmese official who received the great English title, 'Companion of the Order of the Indian Empire.' True, he is not very clear what it means; but is there not a wonderful star and ribbon to explain it? It is a daring hope for him to entertain, but still there is no knowing what may happen in these stirring times, and perhaps some day, when he is an old man himself, he may come in for a title too. Only last Queen's birthday the Decoration Angel winged its lustrous way over the province, where expectant men held their breath and watched its course with uplifted eyes. Grand and sonorous were some of the names bestowed upon the elect in Mandalay. There are glad beings in the Golden City who can write themselves 'Bearers of golden swords' and 'Bearers of silver swords.' Is not this something to have lived for? Has not the man who crowns his labours with such a halo triumphed indeed?

The vast majority of the crowds of youths who pass through the English schools are fain to content themselves with clerkships in the Secretariat, Departmental offices, or the courts. Failing these, they obtain situations in merchants' offices, which, though well paid, do not hold out the dazzling promises the more coveted career owes its chief attraction to.

The lad who leaves school at the age of nineteen or twenty, having neither 'interest' nor inclination for further study, makes up his mind to be a clerk, and 'goes into business.' He begins as a volunteer, and serves for a time without salary, proving himself worthy of engagement as a regular clerk. A trustworthy useful man may earn as much as two hundred or two hundred and fifty rupees a month, so the beginner does not grudge the time he is called upon to give without remuneration at first. During his probation he learns business habits, punctuality, and practises his handwriting. He takes out the pay he does not get, in ink and stationery, of which he consumes vast quantities in experimental calligraphy. From his own point of view, so far as we have been able to judge, his duties chiefly are: to look busy whether he is occupied or not; to learn the art of keeping his chairpot alight without detection when a superior visits his desk; to watch the older *kiranies* (clerks), and be prompt in leaving the office at five o'clock. He varies these rudimentary labours by copying the letters and papers his fellow-clerks obligingly place at his disposal when

inclined for a little rest or quiet recreation themselves.

After five or six months, you will find one morning on your table a laboriously constructed envelope of imposing size, addressed to you as 'Manager' or 'Superintendent' of the firm you serve. This contains a petition from the volunteer couched in the orthodox style. It represents with what diligence he has toiled in your honour's office without pay; dwells on the difficulty he finds in maintaining his wife and little children upon nothing at all; points out the advantages the retention of his services must confer upon you, not him; and concludes with a confused dual prayer for your honour's eternal good health and a salary of, say, fifty rupees per month.

The writer, you may be sure, is waiting outside, engaged in eager telegraphic communication with the punkah-puller, who, from his coign of vantage in front of you, is able to notify when the missive receives attention. The head-clerk is summoned, and gives evidence regarding the progress and talents of the petitioner: his opinion on the whole is favourable, so you call him in and offer him an 'agreement' for two years on a salary of twenty rupees a month, qualified by power to dismiss him if necessary. The boy clasps his hands and turns beseechingly to the head-clerk; but he has been through it all too often, and judiciously looks the other way. 'Twenty rupees a month! He hastily presses on your memory that he has 'a wife and little children.' 'If you please, sir,' he begins; but language fails him; and you take the opportunity of reminding him kindly but firmly that you can only pay him what his services are worth, irrespective of the size of a family, which at his age he has no business to possess at all. The argument is lost upon him, and he retires, thoughtfully repeating to himself the terms he has been offered, to report the result of his petition and interview to his friends outside. A long and earnest debate is usually terminated by his decision to accept the offer; and he returns to announce the fact to you, which he does with a suspicion of forgiving reproach. Thereafter, he returns to his desk, and having procured a new pen, devotes the remainder of the day to transcribing his 'agreement' from a stereotyped form, of the meaning of which he has but the vaguest conception.

An intelligent Burman makes an excellent clerk if he is carefully managed. He is fairly accurate, very neat, and sometimes methodical. If left to himself, he goes on his way in plodding contentment, and so long as he has plenty to do and his task is not above his capacity, he wants little attention from those over him. The older men look after the juniors, and generally set an example of steadiness and good behaviour. He is very conservative, and will remain with his employers until age and decrepitude compel him to retire, if his salary, regarding which he is not extremely exacting, is enough to keep him in comfort. He cannot, however, endure harshness or scoldings; and if the youthful *kiranies* doings bring them frequently upon him, he will one day be missing from his place, whilst a fellow-clerk brings the simple explanation that 'he does not wish to come any more.' Such a resignation, we

may observe, is generally sent in on the day following that upon which his month's wages have been paid.

The Burman marries very early in life; he regards matrimony as a positive duty, to be entered upon as soon as he has settled employment, if, indeed, he has not taken a wife before then. The pair reside with the parents of the bride for a year or two after marriage, whether the husband is earning a livelihood or not. The wife continues to keep her fruit or sweet-stuff stall in the bazaar, but more for occupation than profit; though she is a remarkably good hand at driving a bargain with a stingy customer. The Burmese woman possesses a firm will and an excellent temper, and when the time comes for a young couple to set up an establishment of its own, she makes a model housekeeper. Not until then does she abandon the wicker stool and big brass tray which formed the stall and held the stock-in-trade she used to carry to the bazaar every morning. Now, she is above that sort of thing; but her instincts are still commercial, so she opens a shop and fills it with the wonderful collection of miscellanies in which the small Burmese trader generally deals. Here she sits all day, smoking, chatting with the neighbours, petting the children, and rolling cheroots for sale.

The variety of races which form the population of the seaport towns is a curious tribute to the thrift of the country. Europeans of every nation, Americans, Chinese, Armenians, Negroes, and representatives of almost every Indian people between the Himalayas and Ceylon, find a home there; and the children of the soil dwell amongst them on the best of good terms with all. The Chinaman, who prospers there even better than he seems to do everywhere else, is glad to get a Burmese wife. Her ways appeal to his business-like nature; and though he will work twenty hours out of the twenty-four, seven days in the week, 'for his own hand,' it is convenient to have a partner whom he can trust to do as well as he could himself, when he wants a rest. The boys of such a pair are educated and dressed as Chinamen, and the girls as Burmese!

The European who settles in the country often takes a daughter of the land as the wife of his bosom; so does the Armenian. So would the native of India, if he found favour in the ladies' sight. The wealthier Suratis do find such favour sometimes; but the native has ever in his mind's eye the home of his youth, to which he will retire to pass the evening of his life, and the Burmese girl will not leave her country.

Education does little to lead the Burman astray in matters connected with dress, and the utmost alteration he indulges in is the substitution of shoes and stockings for sandals. A recent edict permits wearers of the former to retain them in court, &c., and some of the younger officials take advantage of the rule.

By nature enterprising in gastronomical matters, education and opportunity encourage the Burman to explore the contents of those inviting 'tins' which are within the reach of every one who lives in town. The man who can master the 'Directions for Use' might be fairly expected to exercise some little discretion in applying them. But the Burman passes them by, and devours preserved peaches, jam, and Swiss milk in astonishing quan-

ties with a placid disregard of possible results which is entirely his own. Ice is another product of civilisation which he appreciates highly, and he is a staunch supporter of the factories which supply this necessary. Ask one of your clerks if his distorted visage argues a broken lower jaw, and he will dive head first under his desk, reappearing with the smiling explanation, 'Only ice, sir,' to disabuse your mind of the impression that you have caught him chewing the objectionable betel-nut in the office.

Although the inhabitant of the town loses much of his simplicity, he retains all his childishness. He affects to despise the country-people—'sons of the jungle,' to translate his own term literally; but nevertheless he cannot lay claim to the more manly qualities which gain the district villagers the better opinion of Europeans.

The unconquerable indolence of the Burman disqualifies him for competition with the foreigners, who monopolise all but the interior trade of the country. He has reaped less advantage from civilisation than he ought to have done, and seems quite content to be elbowed aside by strangers so long as his personal comfort is not interfered with. Like one of his own sacred images, he sits with idle hands whilst the dogs and crows scramble for the offerings a bountiful nature has placed before him. Happy in the present, for which he wants little, and careless of the future, which may be trusted to provide for itself, the Burman finds more enjoyment in life than those who pass their existence in a breathless race for the wealth he does not care to contend for; but as his acme of happiness is to be perfectly idle, it is obvious that in a country where famine is unknown and charity is inculcated as the noblest of virtues, it is not difficult to satisfy him.

'TOO LATE.'

'THERE was nothing in the story!'

Thus the people said;
But they load her name with glory,
Now that she is dead!

'Were the verses worth the reading?'

Hush! she wrote for bread.
Every line seems full of pleading,
Now that she is dead!

Weary fingers, temples throbbing,
Heart that weighed as lead,
Eyelids used to slumber-robbing,
Ah! and now she's dead!

O ye people, how your scorning
Filled her soul with dread!
'Let me sleep,' she moaned; and morning
Came, and found her dead!

Kindly judge, then, those who, living,
In her footsteps tread.
Praises, too late in the giving,
Come but to the dead!

THE TREATMENT OF SERVANTS.

By MRS LYNN LINTON.

THE servants of a good, liberal, well-conducted, middle-class house, where the mistress is her own housekeeper, fare well and have no cause of complaint. They have good wages and substantial allowances, are not overworked, and are humanely considered. Their flesh and blood is not held to be of a different 'paste' from the flesh and blood of their employers, and the arrangements of life are the same, differing only in the proportion of their parts. These servants have their times of freedom and their holidays, and are allowed both 'followers' and friends. A cup of tea to an acquaintance on her afternoon or Sunday out is as much part of the régime in the kitchen as it is at five o'clock in the drawing-room; and no one grudges what no one misses. The young man, if respectable and with honourable intentions, is countenanced even to the length of a Sunday supper; and a mistress of this sweet womanly kind interests herself in the engagement. Two or three times a year theatre tickets find their way to the trim-waisted world below stairs, and the maids are sent off in a cab which the authorities hire and pay for. To all the great exhibitions, too, they are suffered to go with peace and a free mind; and if, held by their duties which they must not and do not wish to neglect, they are not on the crest of the wave of pleasure and amusement, like the fine ladies who have nothing to do but enjoy themselves—they are not left stranded in a stagnant little back-water of dullness, where they consume valuable time in fruitless longing and the mental disturbance resulting. In a word, they are treated as part of the family, all the same as the young ladies and the young gentlemen home for their holidays, and they are not held as fit only for cinder-sittings and black beetles. Hence they are happy, and for the most part, almost invariably indeed, well conducted. They know that they have the 'best pitch in

the market-place,' and are anxious not to lose their privileges by their own faults or follies. It is just that happy mixture of freedom and discipline, work and play, kindness and authority, which makes the best happiness of a home; and such a house as this is the blue ribbon of service and never wants for candidates of the first class.

Contrast such a life as this with the restrictions and leaden dullness of a house where the servants are treated as distinctly 'inferiors'—creatures without rights, and denied privileges—animated machines for doing the work all the same as if they were humanised brooms and brushes, intelligent pots and pans. Everything which lifts them out of that level is a matter for ridicule, animadversion or rebuke. The love of finery, which is integral to the female sex from the lady with her beads to the queen with her crown, is a fault when exhibited by a maid in such a house as this. The love of children, the desire to possess a home of her own, a 'treacherous inclination' for a good-looking lad likely to make a pleasant husband, all of which go with the sex, are so many proofs of supreme folly or of latent iniquity. She is a servant born to scrub and brush, attend on her betters, to accept such portion as is meted out to her at life's great feast with patience and gratitude, and all endeavours after independence are to be sternly regarded and severely repressed. Then the mistress breaks forth into loud self-pity and indiscriminate condemnation of the whole class, when human nature asserts itself, as it often does in these houses; when quarrels and flighty tempers interrupt the smooth working of the machine; when the natural instincts so cruelly compressed, which would have been satisfied with a little wholesome play, flow over into vice, perhaps crime; when things are done in the dark which would never have been done in the light; and when cataclysms and catastrophes convulse the family from A to Z—all for the want of understanding that human nature is a pretty constant quantity, and that it is not to be changed by a print frock or velvet gown.

Less worthily treated than even these domestic prisoners are the under-servants in large mansions where the mistress has—perhaps by necessity—delegated her authority, and the upper servant of each denomination is the master or the mistress of his or her respective subordinates. In these underground worlds goes on an enormous amount of tyranny which never sees the light, save such as is shed in hospitals, the gin-shop, or the receiving-houses by the river-side. These under-servants of rich men's houses fail by the hundred. They people the hospitals and the streets, and are the great sources of illegitimate children. That same human nature which here again is disregarded, has the trick of avenging itself in one way or the other, and those who know the domestic 'underneath of the cards' know this fact by heart. During the season, when bulls and dinners are on hand, the under-servants are continually kept up to four and five in the morning—'redding-up' after the turmoil of festivity is over. As they are generally young girls and boys who have not come to their full strength but are still growing, and for whom, therefore, nature demands long hours of sleep, we can easily imagine the infinite mischief done to them by the harsh conditions of their lives. They are the veritable helots of our homes—the unhelped and unobserved slaves of our civilisation. When they go down those area steps they go into the very jaws of death; and lost souls as well as ruined bodies are the tax we pay for our domestic grandeur. Very few know anything at all of this side of service, and there is no external organisation to regulate its terms. Compared with the numbers employed, there is very little trades-unionism among servants, and the half-secret societies of which we once heard so many exaggerations seem to have vanished into space—if, indeed, they ever existed. Anyway, domestic servants, especially these young underlings, are the least protected section of the community; and if they cannot help themselves, there is no one else who can.

In hotels, again, and the large Mansions now so popular, the women-servants are hardly dealt by. Men can make better terms for themselves. The women, however, are generally badly fed, overworked, and under-paid, and for the most part scurvily lodged. But they pick up extra vails, and have less personal overlooking and a longer tether than in private houses. Hence, in spite of the scanty food, which they have to supplement out of their own purses, in spite, too, of the chance of a sudden and unjust dismissal because the manager is savage or the housekeeper cross, they are always to be had—and the sea is never emptied of its fish. The ease with which they can be replaced adds to the carelessness with which they are held; and the overstocked state of the labour market hardens the hearts of the purchasers of labour.

Lower even than these—lower than the helots of fine mansions—in fact lowest of all in the scale, is the lodging-house slavey, that poor begrimed and desolate beast of burden who has of humanity but the features and the name. An apprentice on board a merchantman under a brutal captain may be worse treated than this miserable derelict of society. But save this possible parallel, the lodging-house slavey stands supreme for wretchedness of condition. Worked beyond her strength and fed below her needs, this poor young girl has

not one ray of sunshine in her gloomy life, one pleasure that she can call her own, one right, one privilege, one breath of independence. Her parents are too poor and too far off to help; but probably she has none at all. The round of wrong began with her mother, to whom board and lodging for her unfathered child was too valuable a help to be let slip. Hence, her mistress can do as she likes with her outside the broad legal line of positive bodily injury. She can keep her out of bed to all hours of the night, and make her get up at unearthly hours in the morning. She can deny her all pleasure, all relaxation, all personal pride in dress, and even the cleanliness demanded by civilisation. She can feed her on improper food, and give her insufficient rations even of that. She can make her life a burden to her; and she often does; so that her poor little friendless slave, too young or too timid to go to the bad, ends her life and her woes together by a draught of vermin-killer or a plunge into the swift rolling river.

The lodgers may, if they will, follow the landlady's suit. The decayed gentlewoman in the parlour, who expects to be treated with the attention she was accustomed to receive when her papa the Major was alive and she broke the hearts of subalterns by the dozen; the irascible old bachelor in the drawing-room, with a temper always on fire between rheumatism and suppressed gout—these two alone would try the nerves of a rhinoceros and the strength of a horse. But these two are only alternative blisters to the permanent smart of the mistress. To be sure there may come moments of fearful joy, bound to a sorrowful ending, with the young gentlemen in the single rooms above. But these moments are made difficult, partly by the missis's unsleeping vigilance and partly by her own smutty face and unappetising flesh. The life of the lodging-house slavey is one of unmitigated torture; and there was many a dusky field-hand, singing while hoeing in the cotton plantation, for whose freedom so much blood was shed and so much treasure spent, whose lines had fallen in golden places compared with those of the uncertificated slave among ourselves.

Less brutally treated, but oppressed with what a terrible monotony of negative misery!—the one young servant of the starved old maid or widow of limited income appeals to the sympathies of all who know her. Not so cruelly overdriven, not so sharply goaded and lashed as the lodging-house slavey, this little maid-of-all-work to a prim elderly lady to whom sixpences are coins of value, is even more tightly held than her more degraded sister. Never suffered to go out save at the heels of her mistress, she has no chance of making acquaintances dangerous or consoling. Watched over the parlour-blind, she cannot exchange a word and scarce a look with the baker's boy or the grocer's young man. All the instincts of love and pleasure, natural to her age, are suppressed with a hand of iron; and fifty measures out to seventeen its apportionment of gladness on the lines proper to itself. In one thing, however, the little maid-of-all-work is better than the slavey—she is taught to be clean. Her mistress in season and out of season insists on the spotless purity of flesh and garments, and a smudged face or a rent apron ranks as a moral crime. Some-

times the little maid plucks up enough courage to give notice and find another situation. Sometimes she stays on and on, the weight on her head growing with time, and the heaviness of her soul becoming chronic. Her desire for movement, change, love, pleasure, fades into the dull acceptance of her fate; and while still a mere girl, she becomes as old as her mistress. The life she does not know she has learned to fear; and when her prim employer dies, she leaves behind her a premature fossil, a spiritual descendant inheriting all her own grim characteristics. Then is she a terror to evil-doers on her own account; and evil-doers are as many as there are of the thoughtless, merry, light-hearted young. But for the most part she herself dies early, like buds damped off before they open. Her life has been without Hope to help her on; and life without Hope is the world without the sun.

JOHN VALE'S GUARDIAN.

CHAPTER XXX.

SNEELLING had plenty of time for thinking as he stood bridle in hand and watched the house burning. He made no doubt whatever, when he saw young John standing there unharmed, that the burning of the house was a chastisement and warning direct from Providence. That was at first and whilst the shock was new. But Isaiah gave another current to his thoughts by a mere phrase. 'You'll be glad you was insured now,' he said. 'You fought agen me pretty hard when I wanted you to do it.'

Why should Providence deal in chastisements which fell upon the wrong shoulders? It would be the insurance office which suffered, and not he. The only things which the insurance could not and would not have covered had been rescued by Isaiah. Providence was on his side rather than against him.

'Who give you the right to use that lamp, Mr John?' he asked.

'Nobody, sir,' the boy answered; 'I found it in the lumber-room.'

'Well,' said Snelling, pointing with his riding-whip towards the fire, 'that's what comes of a lad acting without his elder's knowledge. Thee'st burned thee and myself out of house and home, my lad.'

'I can put you up for the night, Mr Snelling,' said Isaiah; 'and I shall be glad to do it.'

'Very well, Isaiah,' he answered. 'After this night's work, there should be nothing but good-will on my side. I'll say "Yes" to your offer, and be thankful for it.'

'My horses'll be catching cold,' said Isaiah. '—Tumble up into the brake, Master John.—There's nothing there to stop and look at, gaffer. Come along.'

Snelling put his foot into the stirrup and looked across his horse at the still burning house, whilst Isaiah put the rescued books and the cash and deed boxes into the brake. He had fallen into a brown-study when a new call aroused him, and he swung himself slowly into the saddle. Two or three of the yokels offered him a sympathetic 'Good-night, sir,' as he rode away.

'Good-night, my lads—good-night, and thank you kindly,' he answered as he rode away. He knew that he was acting solidly and as became a man.

Mrs Winter stared at the arrivals, and was by no means disposed to receive Snelling graciously. Even when she heard the news, she was chill and prim with him, remembering the quarrel between him and her lord and master.

'If you'll take a seat here, gaffer,' said Isaiah, 'me and the missis'll see about house-room.—Come along, missis, and bustle up a bit.'

'I'm a Christian woman, Isaiah,' said Mrs Winter, pausing at the foot of the stairs outside, 'and if he was poverty-struck and couldn't afford to pay for a lodgin', I could find it in my heart to give him shelter. But it's no business o' yours to be fetching your enemy into your own house.'

'I've noticed this twenty year back,' returned Isaiah, 'that when you're going to say anything nasty you start with bein' a Christian woman. Now, never you mind what sort of a woman you be, but just remember that the man's in trouble. This ain't the first facer he's had to-day. He's come on live sand in the shaft he's sinkin', and that'll be a heavy loss to him, let alone the disappointment.—Just you put a bright face on it, missis.'

'You're too good for this world, Isaiah!' his wife made answer; 'you'd let anybody put on you.'

'Not much, I wouldn't,' Isaiah returned; 'and when you see me being put on, it'll be time enough to tell me.'

With the assistance of the serving-maid they got ready the guest-chamber, which had never yet been slept in and was of a ghastly newness. There was a great funeral emblem of a bed, with French-polished pillars and French-polished foot-board, and heavy sombre curtains which closed it in all round. The rest of the furniture was in keeping with this gloomy catafalque, and the whole chamber was as provocative of cheerful fancies as a family vault. But when a great fire had been lit upon the hearth and candles set upon the chimney-piece, it wore an aspect something less gloomy, and Snelling being inducted into it when all was ready, nodded approval of it.

'By the time you've had a wash,' said Isaiah, 'supper will be ready. You'll find your way down again.'

At table, Mrs Winter stood to wait upon him as of old, but he refused this flatly. 'I'll take neither bite nor sup in the house till you sit down, Mrs Winter.'

She took her seat, not without pride at meeting her old master on equal terms, and was glad that Madame Vigne's visit had given her an opportunity of airing the new black silk. Mr Snelling might, if he liked, think that she wore it regularly; and for the matter of that, Isaiah could have borne it if she had chosen to be extravagant.

Little was said during the meal; and when, after it, Snelling had smoked his nightly pipe and drunk his glass of whisky-and-water, he asked for the rescued books and carried them up-stairs. Then he sat down beside the guest-room fire, and drawing the two candles together,

began to study his accounts. 'That's lucky,' he said. 'Three hundred and twenty against Dixon. I shouldn't have thought it was more than a couple of hundred.—Why, there's Beasley again. Six hundred. I should never have had the face to tell him it was more than three, unless I'd had the book to back me. My patience! here's Ready. I should ha' been forty or fifty out on that.' He went over page after page, tracing the lines with a heavy forefinger as he read. By-and-by he took out a pencil and began to figure on the back of an old envelope. 'If Isaiah hadn't saved the books, I should ha' been two or three thousand pounds out of pocket,' he mused. 'He's a high-couraged chap is Isaiah. I doubt if I should ha' had the heart to face that fire myself. There's a servant for a man to have thrown over! The little chap's worth his weight in gold. If it hadn't been for the lad, I should never have lost him.'

The day's long waiting, with the crushing loss and disappointment at the end of it, the episode of the fire, his guilty hope, and its failure of fulfilment, all weighed heavily upon him, and bore his spirit down into a sort of dull meekness. His hatred and his egotism alike seemed dead.

He burned the scrap of paper on which he had made his calculations, and stowed away the books beneath his pillow. Then, more than half mechanically, he thrust the window curtains aside and drew up the blind to look upon the outer night. He had not known in what direction he was turned until the glowing mass of the ruined house half a mile away met his gaze. It looked less distant than it really was, seen through the dense darkness; and a bare winter tree or two, silhouetted against its brightness, gave it an aspect infinitely mournful and dreary to his fancy. Now and again a flame played up from the red smouldering pile, and brought hidden things fantastically to light.

He had never been aware of any affection for the place; but it came to his mind now that his mother had been born within its walls and had spent her girlhood there. That touch of memory brought a strange heaviness to his heart. Things were not going well with him. He doubted if he were doing well with himself, and he thought simply that his mother would have been sorry to have known him as he was, with his foiled purposes, and all these disasters about him, and the sense of estrangement and loneliness which oppressed him.

He drew down the blind again, closed the curtains, and undressed for the night. Sleep had always been averse to him in a strange room, and the events of the day had been unusually disturbing. He tossed and tumbled in the close gloom of the enfolding hangings, until at last he could bear their confinement no longer. He got out of bed and drew the curtains close to the poles, to admit the light of the fire, and having done this, went striding up and down the room. Isaiah had left a nightshirt for him, which reached no lower on his big frame than the kilt of a Highlander, and every time he passed the great mahogany wardrobe, he caught a grotesque reflection of himself in the mirror which fronted it, striding bare-legged in the semi-darkness. He took vigorous exercise in this way for half an hour, striving to banish thought,

and finally plunged into bed again. There was still no hope of sleep for him; and his glance wandered about the room until it lighted on a cornice, the harmless bravura plaster scrolls of which somehow, in their own murky corner, assumed the semblance of a death's-head with eyes in it. The thing had a strange likeness to his nephew John, and he lay and stared at it like a man fascinated. We are all cowards in the dim midnight of our thoughts, and there is something perpetually at the elbow of the bravest man alive which may at any moment overwhelm him with an unspeakable fear. Had the fire been placed this way or that by the distance of a yard, the harmless plaster scrolls could have worn no such aspect as they owned. The man knew that; but the live, staring, horrible, accusing eyes—John's eyes—dwelt on him with an insupportable appeal. They seemed to search him to the marrow, and there was a something denouncing in them, a promise to speak his secret to the world. His soul lay bare to the mystic eyes which light and shadow had created in that corner, and he sweated and trembled in a waking nightmare. Providence for him? Providence on his side? In what had he prospered since that demoniac thought had taken hold of him? He was so much poorer in this last two years than another eight or ten spent in the like manner would ruin him and leave him a pauper. He was isolated from the world; and if he had known the lines, they would have seemed apt to him: 'There is no creature loves me, and when I die no soul will pity me.'

He lay shaking in a tragic pity of himself. He would break with this lust of wealth, this fiend of avarice which had tempted him. He would leave the lad alone, and covet that which was his no longer. The watch under his pillow ticked a furious warning, the gloomier shadows hid denouncing faces, the hum of the quiet night was thick with threatening whispers. A veil, which had never fallen before, seemed drawn aside, and the supernatural unknown was everywhere. He dreaded lest it should grow tangible to touch and visible to sight, and it was the more horrible that it did neither.

He slept at last, and even in the act of falling to sleep, when he could not resist for weariness, he had a horror of his dreams. No dreams came; but in the cold gray light of the winter morning he felt that he dared not pass another night in that chamber.

By the morning light at the breakfast table, Isaiah appeared a little smoke-begrimed and singed. 'I knowed nothing about it at the time,' said Isaiah; 'but I've lost half a whisker, and my cheek's that raw I haven't got the pluck to rub the grime off of it. I reckon the hair'll grow again, and if it don't, I must trim the other to suit it.'

'You've ruined your new black broadcloth overcoat,' said his wife; 'you'll never be able to put it on your back again; and if Mr Snelling's the man I've always took him for, he'll do no less than pay for it.'

'My blessid!' said Isaiah. 'Better is a dinner of herbs than to dwell with a contentious woman on the house-tops. Why, missis, you ought to be ashamed of yourself.'

If Snelling had been a sensitive man with

regard to other people's feelings, this small passage-of-arms might have made him reluctant to announce his intention of leaving the house. As it was it helped him. 'Me and Isaiah will have a settling-up, Mrs Winter,' he said quietly. 'Never you fear about that. At the same time, mum, it was my business to find that out and not yours to tell me. You might have trusted me to do it. There's been a good many things said agen me of late; but nobody till now has ventur'd to tell me as I didn't pay my way.'

The pair of steppers legitimately exhausted Isaiah's accommodation; but he had contrived somehow or other to stable Snelling's horse; and when his old employer expressed a wish that it should be brought round to the door, he himself saw that that service was performed. Before mounting, Snelling shook hands with him.

'Your missis,' he said, 'was always a bit of a tartar in a quiet way, and as long as her lives her'll never forgive me for offering you the bag. After last night, you and me, I tek it, are likely to be friends. I must ride away and get a thing or two to keep myself decent; and in the meantime I shall put up at the *Barfield Arms*.

'As you like, gaffer,' returned Isaiah, and went within doors to deliver his mind to Mrs Winter.

Snelling's way to the *Barfield Arms* led him naturally past the ruins of his house. There was quite a crowd about the gateway, and Farmer Shorthouse was conspicuous there in a tall dog-cart, with Cecilia by his side. The rejected lover had never spoken a word to the girl since the night when he had overheard her conference with her father. She held out her hand to him now with a sympathetic look; and when he leaned over in his saddle to take it in his own, she gave him a warm and friendly pressure.

'Oh, Mr Snelling,' she said, 'I am so sorry for you! The house your mother was born in! Father has been telling me. Such a beautiful old place too. I know that you must feel it deeply.' She had never been so kind to him in her life, and her voice and face and the pressure of her hand awoke a new hope in him. She might not be indifferent to him, after all. Perhaps it had been no more than the foolish tyranny of his own manner when he had been excited by finding her with Jousserau which had frightened her away from him. If his proposal had seemed wholly impossible in her sight, she would never have taken a fortnight to consider her answer. On the very day on which her refusal came, her father had been confident of her consent. And since with him to ask and not to have was the surest way to longing, he was hotly in love with her by this time.

'It's been a bit of a blow,' he answered; 'I don't deny it.' He was bent on showing himself in a favourable light, and her reminder of his mother helped him to remember his last night's thoughts. 'The money loss is covered; but there's things gone there'—pointing to the ruins—'that no money can buy back again. As you say, Miss Shorthouse, my mother was born and lived up in them old walls. I thought of that last night, and it gave me a sore heart, I promise you.—Just you think, Shorthouse,' he added, addressing the farmer, 'how one man may be mistook in regard of another. There was Isaiah Winter, whom I gave the sack to, believing him to be my enemy,

and it's him that fetches my books and deeds and cash-box out of the fire at the risk of his own life. He saved me two or three thousand pound by that—maybe more. He might ha' let 'em burn, and never have been ill thought on. I slept in his house last night, and yet it's only like yesterday that we parted ill friends.'

'Well,' cried the farmer, 'I'm glad you've come to be of the old mind again. Isaiah's a good sort, always was, and ever will be.—But Bob, old lad, thou'll hardly have a place to eat thy Christmas dinner in. Come and tek it along with me. You've never put foot across the threshold sence'—

Cecilia's warning hand restrained him from completing the sentence. Snelling looked at her, wondering if she would confirm the invitation.

'Pray, come, Mr Snelling,' the girl said innocently; 'we shall be very glad to see you.'

'Well,' he answered, 'I will, and thank you.—There's my hand upon it.'

She gave him the same friendly pressure as before, not guessing what fancies her manner aroused in him. To her own thinking, the past was dead and buried, and she did not so much as dream of a revival of it. But Snelling rode on more than half triumphant. If his misfortunes had awakened kindness in her heart, they were easily to be borne, and even welcome. He had never expected to feel as he did about Cecilia. So long as he had felt certain about her, he had been indifferent; but when the certainty had been shifted to the other side and stood against him, it grew to be another matter. Thousands of men have discovered that middle age is the true time for the growth of a royal passion; Snelling made the discovery in his turn, and wondered at himself.

'I was never the man to be beaten,' he said as he rode on, invigorated by this new thrill of feeling. 'I enlivened throughout the whole of his burly and muscular frame by the keen winter air. 'I won't be beaten now. If she'll think better of it—and she looks as if she might—there's little I wouldn't do to get her. There's coal below that land of mine, I know, and if man can get at it, I'll do it. As for money, I'll find her enough for a titled lady; and as for men, if that's in question'—He squared his great shoulders exultingly and looked down at his massive limbs. 'That's an arm could take care of a woman,' he said to himself, stretching his right hand abroad. 'I'm none o' them whipper-snapper chaps as thin as a turkey's leg, as looks as if you could crack 'em like a stick o' sealing-wax. There's pith and substance in me; and if I cared to know my value, I daresay there's a many young woman as might ha' looked kindly on me.'

So, all things considered, he rode on in high feather; and once alighted at the *Barfield Arms*, ordered rooms there for a month to come, and beat the landlord's prices down in quite his old victorious manner. When his arrangements for his stay were completed, he sent a messenger in search of Mr Procter; and that gentleman appearing in answer to his call in the course of the afternoon, he hailed him with a cheerful countenance. 'Look here,' he broke out; 'can't we circumvent that sand?'

'We can try,' said the cautious Scot. 'Ye don't want another sand-mine. There are surface

indications more or less; and if you wish it, I'll make a careful survey.'

'Yes,' said Snelling, 'I do wish it. I'm bad to beat; and I'm not going to see my neighbours get all the plums out of the pudding and me get nothing, if I can help it. You can get a plot of my land and my nephew's from Roland, the surveyor, and I'm game to make another try whenever you decide.'

'Well, Mr Snelling,' said the engineer, 'you're acting with courage, but I think ye're acting wisely. From what I've seen of the opening up of the district, I'm not inclined to think that the sandbed is a large one. I think on the north-west we're safe from it. We'll be farther away from facilities for cartage; but that will really matter very little. I'll have a good look at things, and let you know my opinion as soon as maybe.'

Snelling's heart was full of happy augury. In spite of failure and disaster, he had never felt so hopeful. A kind look, a kind word, a friendly pressure of the hand had done it all. If he won her, he would abandon his schemes against his nephew. With Cecilia's fortune in his hands, and the mineral wealth of his own land laid open, he would have enough. He would live at peace with mankind. He would be content with his own.

AN AMERICAN COMPANY PROMOTER.

COLONELS in America are 'about as plentiful as blackberries, and a little plentifuler.' Most of them, according to their own account, have fought, bled, and died for the Constitution. But Colonel Snyder followed a safer and a more remunerative profession than that of fighting his way to glory. He was a philanthropist—in other words, he was a Company Promoter, who travelled through America, England, France, and Belgium supplying a public want long felt—namely, successful undertakings for the investing public, by means of which the said investing public should be able to support themselves and their families with, or without, twenty-four hours of easy work per week, enjoy town residences and country places, drive through landscape and rural loveliness, and make excursions in yachts all their own. Colonel Snyder's profession was safe because he had been a lawyer, and 'ruler smart at that:' it was remunerative because there are people who expect to buy a gold watch for fourpence-halfpenny and a Koh-i-noor for a shilling, and who snap up greedily shares in any Company where unscrupulous directors promise a return of twenty per cent. I am very fond of the people; but if Carlyle had written that English shareholders in American Companies were mostly fools, I should have agreed with him.

William J. Snyder was six feet high, and abnormally broad-shouldered, without being bulky or fleshy. He had no neck: his head, like that of Napoleon, seemed to have been set upon his shoulders. His carriage was military, and his manner easy, natural, and wholly unpretentious; it was the nonchalant air of a travelled man. Nature appeared to have designed him to take the lead wherever he might be, and he took it as gracefully as if it were his birthright, without

any appearance of self-assertion on his part, and as if unconsciously. Probably he had never felt that he was at any time in the presence of any one superior to himself. He had a thorough knowledge of human nature; and his success in Company promoting had made him 'richer'n heaven,' and given him a hearty contempt for almost every one except William J. Snyder.

'The Great Jumbo,' as I once heard Snyder called, was a promoter of Mining Companies (gold and silver), Water Companies, Hotel Companies, and Timber Companies. It was his boast that he could float a Company anywhere and to do anything. He was an artistic dissembler; he could put a smile upon his face were things going never so much against him, and would dismiss any troublesome shareholder with the idea that though the Company in which he was concerned was somewhat tardy in paying a dividend, yet the time would come when those who were largely interested in it would be millionaires. Everything comes to him who waits long enough. But no ordinary shareholder had ever been known to wait a sufficient length of time to receive a dividend which had been paid out of the earnings of one of Snyder's Companies. Yet Snyder was a favourite with those who knew him; and for the opinions of those with whom he did not come in contact of course he did not care. Strange that one man who makes a bargain and fulfils his part and makes others fulfil their part should be looked upon as 'hateful to gods and men;' whilst another who promises much and does nothing should be looked upon as one of the best fellows in the world! I am not one of those who think they are specially qualified to take care of the public; but it is to point out where the head of one of the great serpents that have entwined their folds about the business of the country is hidden that I purpose to give an account of the Great Jumbo and one of his schemes.

The Memorandum of Association of the Littellaria Waterworks, Milling, and Mining Company, Limited, set out (1) That the name of the Company should be the L. W. M. & M. Co. (2) The offices of the Company should be situate in England. (3) The objects for which the Company was established were: (a) To carry water from the Purple Mountains to Littellaria; (b) To mill ore from the mining claims which had been and might hereafter be acquired by the Company; (c) To develop and work the mining claims belonging to the said Company. (4) That the capital of the Company should be £250,000, divided into 250,000 shares of £1 each, and that any of the said shares, and new shares from time to time to be created, might from time to time be issued, &c. &c., subject to any conditions and provisions and generally on such terms as the Company might from time to time determine.

Last August I paid a visit to Littellaria, and saw the whole district over which the L. W. M. & M. Co.'s operations extend. Let me describe it. Littellaria is a mining camp in the interior of the State of ——. There is nothing in the physical aspect of the country roundabout to hinder it from becoming a great city: it may grow in every direction. It will have nothing to fear from competition, for there is no important place within a hundred miles of it. It is bounded on the north by a huge scoria-covered mountain,

on the other side of which is a salt marsh. On every other side for a few hundred miles grows the sagebush, a little shrub knee-high, which is absolutely worthless except as a refuge for the rattlesnake and the chipmunk; no other kind of vegetation can thrive in the alkali dust of which the deserts of America are so largely composed. There is no doubt, therefore, that if Littellaria were peopled and cultivated it never could become an agricultural centre. To talk of draining would be superfluous, for every drop of water which comes into the place is carried thither through five-and-twenty miles of the L. W. M. & M. Co.'s piping. There being no trees to attract the rain, the rain never comes; at least, there was but a little shower in the month of August, and one of the miners told me they had not had so much as that for three months past, and 'that was a fact, right down sure, and no two ways about it.' Twelve years ago the neighbourhood was 'prospected;' silver was discovered at Egg-town, a few miles distant; a mining camp sprang up, and nearly two thousand miners swooped down upon the place. They knocked up huts, exhausted the mine, and decamped. A dilapidated wall and a pair of cowhide boots which will defy anything but the last great conflagration, are now the only relics of that once flourishing mining camp. Then silver was discovered at Littellaria, and Littellaria would assuredly ere now have shared the fate of Eggtown had it not been for the Great Jumbo.

Every one knows that ten years ago silver was at a very much higher price than it is now; and although in the palmy days of Littellaria, a purely American Company had extracted three million dollars' worth of silver from the huge hill which rears its great black head against the sky, the cost of living, labour, milling, and carriage was so prodigious that the undertaking was never remarkably remunerative. And when the price of silver fell, it became necessary to shut down most of the mines, especially as all the rich ore and that which was easy of extraction had been milled and forwarded to San Francisco. Such was the state of affairs when William J. Snyder appeared upon the scene. He acquired, probably for less than a hundred dollars each, a few mining claims. He marched with a surveyor from Littellaria to the Purple Mountains, stuck up a couple of sticks, sent a map with about twenty dollars to the government at Washington, and thereby secured the sole right of conveying water from the Purple Mountains to Littellaria. The inhabitants—miners, Indians, and Chinese—thought William J. Snyder had a bee in his bonnet. But Snyder went to England. For a few hundred pounds per annum, a few very respectable gentlemen consented to become directors. A prospectus was issued, and the public subscribed. Snyder was appointed general manager with a salary of six hundred pounds a year; and one of Snyder's friends was, of course, appointed chairman of the directors. It has been remarked that there are two kinds of people—cat-kind of people and mouse-kind of people—and that one kind was made to claw up the other kind. If this is so, there can be no doubt about the classification of Snyder and the British public.

With plenty of money at his command, Snyder returned to Littellaria. He imported labourers;

he set up a mill; and he successfully laid five-and-twenty miles of piping. Two hundred thousand gallons of water were poured into the place daily, a sufficient quantity to work the mill and to supply the three or four hundred inhabitants. Straightway, Littellaria was all alive; every one was confident that it must become a wonderful place; the people in England said so, Snyder said so, everybody told everybody else so, so there could be no doubt about it. English money built a house for the superintendent; English money paid for the labour. The Chinaman who used to sing,

Me no likes American man,
American man no likes me,

relented, and up went the sign of 'Bang Ho, washerman.' This was followed by that of 'Dock Kosin, artist in boots;' and Mike Rebowitz built an hotel. Mike was a good fellow, but his hotel was a curious structure. It was built of wood; the apartments were divided only by a papered-over canvas; and one night distinctly overhearing the conversation of two young ladies who occupied the next apartment to mine, I felt constrained to tap the wall, so that they might know that their privacy was not complete. The Indians, though fallen, still retained much of their dignity. They lived alone, coming only to the market for supplies. In a bird's-eye view which I took of the town, the well-beaten tracks from their huts show like threads. Dress, perhaps, more than fire-water had been their ruin. Summer and winter they wore the same heavy gay-coloured blankets. These occasionally became saturated with rain; they had no change; the consequence was that they were eaten up with rheumatics and all the ills which flesh is heir to.

But a sketch of Littellaria would be incomplete without a reference to its cemetery. There are four hundred inhabitants in the place; there are more than half as many in its graveyard. There are but few upwards of thirty years of age, and most of them died with their boots on, shot with the revolver. Such, I was told, is the history of all mining camps. It must be remembered that miners as a class are largely composed of men who have fled from justice, that they are often addicted to gambling, and that they are invariably suspicious of one another. Extravagant and open-hearted they may be, and are; but thinking little of their own lives, they think still less of the lives of others; and the 'boy' who walks into a saloon, takes a chair, puts his feet on the stove, and salutes the company with, 'Strangers, how are you? Tek a drink,' often ends by shooting or being shot. The revolver is a nuisance here; it is a curse in America.

Three months ago, the shareholders of the L. W. M. & M. Co. refused to supply any more money for carrying on the work at Littellaria. In spite of their general manager's assurance that there had been many worse investments than this offered to the public and snapped up greedily, it at length dawned upon their mind that it was hardly worth while to keep on spending a thousand pounds for every five hundred pounds worth of silver ore extracted, and that it was impolitic to pay high salaries to gentlemen for directing such a business. The mill was consequently shut down. The Great Jumbo talked largely of an

American Company wishing to buy out the English Company. The English Company gave him full permission to sell it; thinking that half a loaf was better than no bread. He has not yet done so, and in all human probability never will. It is much more likely that a few years hence some solitary prospector passing over the spot where Littelaria once had been will discover a Chinese wash-bowl, a rum bottle, and a hole in the ground, and mentally putting these things together, will soliloquise upon the rapidity with which all sublunary things come to an end, especially mining camps.

The inference to be drawn from this sketch is not that all investments in American Companies are bad, but that for a man who has no special knowledge of mining and who has never been to America, it will be wise to imitate the example of Charles Lamb and condemn them at a hazard. The best answer ever given to a Great Jumbo was that of the Scotchman who said: 'If the thing is sae fine, I canna see why ye dinna keep it at hame to enrich yersel.'

UNDER AN AFRIC SUN.

CHAPTER VI.

TOM DIGBY'S right hand clenched, and as Helen clung to his left, she felt his nerves and muscles quiver with rage. A curious sensation of faintness came over her, and she struggled to be firm, as she told herself that she might prevent some terrible encounter.

But there was nothing of the kind, for Ramon came forward eagerly. 'Ah, there you are!' he exclaimed. 'Had a pleasant day?—Why, where are the others?'

'Did you not hear them?' said Digby roughly.

'I? No.—Oh yes; I heard Señor Redgrave call. I missed them as I came through the trees.—What a delightful evening! I passed three years in London, Mr Digby; but I never saw such an evening as this.' He chattered away, as he stepped to the other side of the mule, keeping on without waiting for the other's reply. 'You have had a splendid day, but very hot down by the town. You have felt it cold up the mountain, Mr Digby?'

'Yes, very,' said Digby shortly; and he felt Helen press his hand gently, as if she were imploring him not to be angry.

'But you could not have had a clearer day for the view.—Did you feel the cold much, Miss Helen?'

'No—no,' she said quietly. 'I don't think it was very cold.'

'Generally is.—I beg pardon, Mr Digby! Have a cigar?'

'If I refuse it, he'll take it for a declaration of war, and I don't want to fight.—Why should I?—poor wretch!'

'There you are,' said Ramon, coming round by the back of the mule with his case open. 'The smaller are the best.'

'Thanks,' said Digby, taking one.

'Let me give you a light.'

A match was struck, and by its light Digby

caught a glimpse of the Spaniard's face, which was as calm and unruffled as could be.

Then they went on, and retook their places on either side of the mule.

'I've been very busy too,' continued Ramon. 'Tired; but was curious to hear how you had got on; and yet half afraid that the crater had given way and swallowed you all up.'

Digby felt tongue-tied; but Ramon chattered away.

'I wonder whether Señor Redgrave will let me throw myself upon his hospitality this evening? I called on my way up, and found that you had not returned. I left some fruit; and there was a fragrance from the kitchen window that was maddening to a hungry man.—Ah! here we are.' For they had come up to Redgrave and Fraser, who were standing beside the track.

'You, Ramon?' said Redgrave rather sternly.

'Yes, my dear sir. I thought I would go and meet them; but I missed you.—My dear Redgrave, I want you to give me a bit of dinner to-night.'

'Certainly,' replied Redgrave—and he told a polite lie: 'I shall be very happy.'

For the rest of the way Ramon did nearly all the talking; and during the evening his conversation was fluent and highly interesting as he engaged Fraser in conversation about the antiquities of the place; smoking cigars and sipping his chocolate in the most unruffled way.

'You are making quite a collection of our minerals, I hear,' he said in the course of the conversation.

'Yes; I have a good many.'

'Of course you examined the head of the *barranco* on the west side of the mountain?'

'No; we have not been there yet.'

'Not been! Why, my dear sir, that is the most interesting place of the whole. You should go there.—By the way, Redgrave, I suppose the nearest way would be right across my plantation?'

'Decidedly,' said Redgrave, who seemed puzzled by his visitor's urbanity.

'Yes,' said Ramon thoughtfully; 'that is certainly the best way. There is an interesting mummy cave there, too, about half-way along; but you will certainly be delighted with the head of the *barranco*.—There; I must say good-night. Going now, gentlemen?'

'Yes,' said Fraser, rising. 'It is time we were back.'

Digby rose reluctantly; but it was time they left; so the customary *addios* were said, Ramon making a point of going first, so that Digby had an opportunity to raise Helen's trembling hand to his lips. 'Good-night—my darling,' he whispered. 'I shall tell Mr Redgrave all.'

'Heaven protect him!' muttered the girl devoutly; and she stood there at the door listening till her father returned; and then they lingered, each slightly uneasy, but ashamed to give their fears words, and being content to listen to the voices of the guests, as they came clearly up through the still night-air.

Redgrave felt disposed to speak to his child before retiring for the night, but he remained silent.

'Marriages are made in heaven,' he said to himself. 'I feel helpless; and perhaps Nelly herself

may find the way out of the difficulty, and, somehow, I begin to like young Digby.'

The three guests of the villa went slowly down the track toward the little town, with Ramon chatting pleasantly about the island.

'I daresay you Englishmen are disappointed at the absence of sport,' he said. 'Very different from Norfolk, where I went on a visit when I was in England. Here we have partridges and rabbits—that is all.'

'We find plenty to amuse us,' said Fraser quietly.

'Oh yes; I have seen that. Why, you will have a boat-load of specimens.—But don't forget the head of the *barranco* beyond my place. It will repay a visit; and if I can assist you with guides or men, pray command me.—Good-night.'

'Well, Tom,' said Fraser, in a sad voice as soon as they were alone, 'what next?'

'I don't know, old fellow, and don't want to know,' replied Digby in a tone of voice which contrasted strangely with the mournful speech of his friend.

'You do not know?'

'I only know that I am surprisingly happy.'

'Happy?'

'Yes. You must have seen. Horace, old fellow, I can speak to you as I would to a brother. I love Helen Redgrave with all my heart.'

They walked on in silence for some time, and then Fraser said sadly: 'A boyish fancy.—Come, be a man. This must go no further, Tom. Let us pack up and go away.'

Digby shook his head.

'I am sure it would be better for all.'

Digby drew a long breath, full of exultation, for the pressure of Helen's little fingers seemed to cling to his hand.

'Do you not see,' continued Fraser, 'that you are intervening between two people whom Fate has evidently marked out for husband and wife?'

'Fate be hanged! What has Fate got to do with it?'

'Do you not see that you are making a powerful enemy of Ramon, who has the father at his mercy?'

'I'll pitch Ramon down one of the *barrancos*, if he doesn't mind what he is about,' cried Digby warmly.

'Mind he does not pitch you down, Tom. But—about Helen Redgrave?'

'Well, what about her? I know what my dear old moralist is about to say: Marriage is a serious thing—I have my friends to study—I ought not to be rash—I ought to wait—I ought to write home.'

'Yes; I should have said something of the kind, and also warned you to flee from danger—and temptation.'

'Then here we are at the roost, and I am going to get on my perch at once, my dear old model of wisdom; but before I do so, here are my answers to your warnings: I am well off; I am my own master; and I have neither father nor mother to consult. Greatest and most cogent answer of all—Helen.'

Half an hour after, setting at defiance the insect plagues of the island, Tom Digby was sleeping peacefully and dreaming of his sweet young mistress; while Fraser was seated in his own

room, with his arms folded, gazing out through the open window, with the darkness visible and mental ahead.

'He loves her, and— Yes,' he added, after a painful sigh, 'what wonder, poor boy—she loves him in return. Oh! I must have been mad—I must be mad.—And that man Ramon? Yes; he smiled and showed his white teeth. I would not trust him for a moment. The calm was too false and treacherous. If I could only get the poor boy away!'

CHAPTER VII.

A week of unalloyed happiness passed, during which time every evening was spent at the villa. Digby grew more joyous; the saddened look was rapidly passing away from Helen's face, and that of her father grew puzzled, while Fraser's seemed more sombre and sad.

Ramon had fetched them to his place again and again, and had also begged leave to accompany them in two of their expeditions, finding horses and mules, and proving himself a polished and agreeable guide, taking them to various points, whose marvels made Fraser forget his own trouble in the excitement of discoveries dear to a naturalist's heart; while, after these journeys, Ramon always insisted upon the travellers accepting his hospitality.

They had just finished dinner, and Ramon had left them for a time, one of his servants having called him away, a summons which, after many apologies, he had obeyed, leaving the friends together, when, pushing the jug of excellent French claret towards his companion, Digby, who was slightly flushed, exclaimed: 'Taste that, my boy, and confess that our host is a charming fellow and a polished gentleman.'

'Yes, I confess to those,' said Fraser gravely; and just then Ramon reappeared at the door, bearing a fresh box of cigars, which he handed to his guests and resumed his seat.

'One of the evils of possessing plantations,' he said. 'Your men are always coming with the news of some disaster.'

'Nothing serious, I hope?' said Digby.

'No, no—a mere nothing—kind of blight appearing.—But, by the way, you two have never visited the head of that *barranco* yet. Don't forget it. When will you go?'

'When Fraser's ready.—What do you say to to-morrow?'

This was agreed to, and Digby rose as if to leave.

'There,' said Ramon; 'I will not keep you fidgeting to go; only leave friend Fraser to smoke another cigar.'

'Really, I don't think'—began Digby, rather petulantly.

'Do not be angry, dear friend,' said Ramon kindly. 'I meant no harm. Apologise for me to my dear friend Redgrave.—You will stay, will you not, Fraser?'

'No; I will go with him,' said the latter hastily. Then, in a hurried confused manner, as if he were mastering himself, 'No,' he added, 'I will stay, and have a quiet smoke and chat with you about the head of the *barranco* and what we are likely to find.'

'Poor boy!' said Ramon, with a gentle smile,

when Digby had gone. 'Well, he has won a charming girl. You and I, Mr Fraser, are getting old enough to put these things behind.'

'Yes,' said Fraser gravely; and he sat talking to his host till quite late.

CHAPTER VIII.

According to what had grown into a custom, Digby found Helen and her father by the gate which commanded the steep track, and another delightful evening, all too short, was spent. Music, talk of England, the life there, all had their turn, and then came the time to go, Helen walking beneath the great mellow stars down with her visitor to the gate, for the last good-night—that farewell which takes so many times to say, and was here prolonged till Redgrave's voice was heard.

'Coming, papa,' cried the girl, as she clung to Digby's hand. 'Then you go,' she whispered, 'to the *barranco* to-morrow?'

'Yes; in good time.'

'I shall see you at night?'

'Of course.'

'And you will take care. I have heard that some of these places are very dangerous.'

'Take care? Yes; for your sake,' he whispered. 'Once more, good-night.'

He ran off, to master the longing to stay; and with an uneasy feeling at her heart, Helen returned slowly to the house, wishing that he had not come alone, so as to have a companion back along the dark path, where it would be so easy for an enemy to do him harm.

She cast away the foolish dread directly, and with good cause, for Digby reached the *venta* about the same time as Fraser returned from his late stay with Ramon; and after a short chat over their morrow's plans, they both went to bed.

The sun was streaming into Digby's room when he awoke the next morning with the sensation upon him that it was very late; and on springing out of bed it was to find a piece of note-paper lying on his dressing-table, on which was written:

'You were sleeping so soundly I would not disturb you. I have gone on. Eat your breakfast, and follow at your leisure.'

Digby dressed under a feeling of annoyance at his friend's desertion. He did not particularly want to join in the trip, for he had seen enough of the island, and would far rather have gone up to Redgrave's; but Fraser's start alone made him immediately feel an intense longing to be off; and consequently he quite upset his Spanish landlady by his hurried and scanty meal.

'Too bad of Horace,' he grumbled to himself as he set off up the mountain track to where it diverged, and the path led to Ramon's plantations, with the house away to the left in a beautiful nook which commanded a view of the distant islands.

For a moment he hesitated as to whether he should walk down to Ramon's for a chat before starting; and he hesitated again after going a few yards; but finally he stepped boldly with the hot sun pouring down; and as he went on, a careworn face was slowly raised from out of a clump of semi-tropical foliage, and Fraser stood well concealed, watching him till he passed out of sight. Then, after a cautious look round, he sank back into his place of concealment, and the birds

that had flitted away returned, the stillness around being unbroken, save when the low deep murmur of the surf arose from far below.

'Too bad of old Horace,' said Digby, as he strode along, past Ramon's plantations, till the wild country began; and recognising various places he had passed before, the young explorer soon reached the spot where the track leading to the *barranco* commenced—a path growing fainter and fainter, and more obliterated by the abundant growth, till it gradually became a mere shelf on the mountain side. The dense tangle at first sloped down to his left, and up to his right, but grew more and more precipitous, till there was an almost perpendicular wall of volcanic rock, out of which the shrubby growth and ferns spread out, and formed a shadowy arch, which screened him from the sun; while a foot away on his left there was a profound drop, the rock again going perpendicularly down, and in places the shelf along which he passed quite overhung the verdant gorge.

And so it continued for quite a couple of hours, during which he went on and on along the shelf, whose abundant growth hid the danger of the way; for it was only at times that he obtained a glimpse of the depths below, where some avalanche of stones had crashed down from above and swept the trees away.

'He's right: it is a glorious walk,' cried Digby enthusiastically; 'only, it seems so stupid to be enjoying it all alone.'

For another hour he went on, still wondering that he had seen no traces left by his friend, but soon forgetting this in the fresh glories of the overshadowed path, and the lovely glints of sunshine in the zigzagging tunnel of ferns and creepers, which literally seemed to flow down in cascades of growing leafage from the wall on his right.

'Nature must have made this path,' he said to himself; 'and it can only be seldom trod. Leads to nowhere, of course, and—Hillo! here's the end.' For, at a sudden turn, after passing an angle of the rock, he found himself face to face with a huge mass of stone, which had evidently lately slipped from a few feet above the track, and completely blocked the way.

'That's awkward,' he said thoughtfully. 'Too steep to get over.—Ha! that's it.' He smiled as he saw that to the left of the large block the green growth had been trampled down, the shelf being wide enough for any one to pass round, though the gorge seemed there to be almost dark, so filled up was it with the tops of the trees which bristled from its side.

'The old boy has been round here for one, this morning. First time I've seen his marks.—My word, he has been chipping away here,' he added, as he looked at the broken fragments of stone in the newly made curve of the path.

Without a moment's hesitation he stepped down, then took another step, for the way descended apparently, to rise again beyond the block. Then another step on to some fugot-like brushwood laid across to form a level way; and as he did so, he uttered a wild cry, and snatched at the rocky side to save himself. Vain effort, for everything had given way beneath him, and he dropped headlong, to fall, after what seemed to be a terrible descent, heavily far below.

He was conscious of an agonising sensation of pain, then of a stifling dust, of a sickening stupefying dizziness, and then all was darkness.

How long he lay there stunned he could not tell; but he seemed to struggle into wakefulness out of a terrible feverish dream, to find that all was darkness and mental confusion. What it all meant was a mystery; for his head was thick and heavy, and memory refused to give him back the recollection of his walk and sudden fall.

But he realised at last that he was awake, and that he was lying upon what seemed to be fragments of sticks; and as he groped about, he touched something which set him wondering for the moment, before he could grasp what it was he held. Then he uttered a cry of horror and recoiled, for his finger and thumb had passed into two bony orbits, and he knew that the object he had grasped was a human skull!

CHAPTER IX.

As Digby cast down the grisly relic of mortality, he clapped his hands to his throbbing brow, and shrank farther and farther away, feeling as if his reason was tottering, and for a time the mastery of his mind had gone. But this terrible sensation passed away as quickly as it had come, and he stamped one of his feet with rage.

He shrank away, for his act had raised a cloud of pungent choking dust, which horrified him again. But this only served to make him recover his mental balance; and as he stood there in the utter darkness, he seemed to see once more the side of that other ravine they had skirted weeks back, when he had drawn Fraser's attention to the climbing figure which they had afterwards encountered as he crept up with his basket.

'I must have fallen, then, into one of the ancient mummy caves,' he said, trying to speak aloud and coolly, though his words came for the moment hurriedly and sounded excited and strange.

He paused again, and wiped the dank perspiration from his brow. 'There,' he said; 'I'm better now; so—What's this?—Yes, it must be: I'm bleeding.' He felt the back of his head, and winced, for it was cut badly, and a tiny warm stream was trickling down his neck.

'That's soon doctored,' he muttered, as he folded and bound a handkerchief about his brow. 'Now then: how far have I fallen, and how am I to get out?'

He began to move about cautiously, looking up the while in search of the opening through which he had come; but for some minutes he looked in vain. At last, though, he saw a dim light far above him, not the sky or the opening through which he had fallen, but a faintly reflected gleam, which feebly showed something black above his head; and at last he reached the conclusion that the opening down which he had dropped was not straight, but sloped to and fro in a rough zigzag.

'How horrible!' he muttered. 'Yet what a blessing!' he added. 'If the fall had been sheer, I must have been killed.'

By cautious progression he at last found the side, but not until he had gone in two other

directions, which seemed to lead him farther into the bowels of the mountain.

This discovery did not seem to help him, for, as he passed his hands over the rough vesicular lava, which was in places as sharp as when it had cooled down after some eruption hundreds of years before, he found that it seemed to curve over like a dome above his head; and though he followed it for some distance, he could find no place where there was the faintest possibility of his climbing up to the day.

'Ahoy! Fraser!' he shouted aloud, and then paused aghast, for his voice seemed to pass echoing hollowly away, giving him an idea of the vastness of the place in which he was confined.

And now for a few moments his former sensation of horror attacked him, as he felt that he might possibly never be able to extricate himself from the trap into which he had fallen, and that he might go on wandering amongst the horrors by which he was surrounded until he died of exhaustion—mad.

Again he mastered his wandering mind, and spoke aloud in a reassuring tone. 'I am not surrounded by horrors,' he said calmly. 'That which is here ought to alarm no man of well-balanced intellect. It is known that I have come this way, by the people at the inn—No: I did not tell them. But Fraser knew I was coming, and he will search for me. Ramon knew I was coming here, and I have nothing to do but sit and wait till I hear voices; and then a shout will do the rest. Horace cannot be long.'

'Good heavens!' he ejaculated after a pause, 'suppose the poor fellow should tread upon the broken place and fall!—No fear. It was covered when I came along. It is all open now.'

He leaned against the side of the cave, thinking of his misfortune, and listening for step or voice to break the terrible silence around him; but all was perfectly still; and think how he would, he could not keep back an occasional shudder at the idea of passing a night where he was.

'Couldn't be darker than day,' he said with a laugh to restore his courage; and then he began to think about Helen, a bright subject, which lasted him for long enough, till the increasing pain and stiffness of his injuries turned the current of his thoughts to his rival; and then, like a flash, a suspicion came to him: 'What did Horace say?—The man was treacherous and false! Great heaven, have I fallen into his trap?'

He tried to argue the thought away; but the idea was only strengthened. Ramon had been so anxious for him to come there—for both of them. The path had evidently been altered, by accident or design. Was it design, and the contriver's idea to rid himself of two men he detested at one stroke?—No; the thought was too horrible, and he would not harbour it.

Vain effort: it grew the stronger; and as the time sped on, and the hurt produced a feverish sensation of half-delirium, Digby found himself fully believing that Ramon had contrived this pitfall; that there was no escape; and that, freed from his presence, the treacherous Spaniard would renew his advances to Helen.

The agony increased, and with the mental suffering came a wild feverish horror, which grew upon him till his brain throbbed; a sense of

confusion, which he could not overcome, increased; and at last—long after he had fallen—he felt that he could bear no more, and all was blank.

THE IRISH GOLD-FIELDS.

GOLD appears to have been found in Ireland at a very remote period. It is recorded that Tiernmas, one of the apocryphal kings of Ireland, worked gold mines in the forests of the Dublin and Wicklow mountains, refining the metal there, and manufacturing it into cups, brooches, and various other articles. Even the name of the ancient artist, Ochadan, is preserved, and his residence, Fercnalann, now Powerscourt, Enniskerry, county Wicklow.

The great number of gold ornaments found in various parts of Ireland, their exquisite workmanship and inimitable elegance of design, testify to the high degree of artistic excellence attained by those early artificers. It appears to have been the practice in those times for the goldsmith to reside close to the mine, digging up and preparing on the spot small quantities of the precious metal, which he then fashioned and finished at his own home into those interesting articles which to-day adorn the various museums.

At a place called Cullen, on the borders of the counties Limerick and Tipperary, is an extensive bog, in which great numbers of valuable gold ornaments have been found, accompanied by crucibles, caldrons, ladles, and other smelting implements; clearly indicating that the district was at some remote period inhabited by a race of professional goldsmiths, whose existence must date from a time antecedent to the formation of the bog. In many other parts of Ireland besides, similar evidences of ancient gold-mining have been discovered, the mine in most cases having been exhausted.

The wealth of Ireland in the precious metals seems at a later period to have constituted one of the chief attractions to the Danes in invading the country, and the tribute they exacted from the inhabitants of the conquered districts was largely paid in gold and silver. The Danish kings and chieftains adopted the native fashion of wearing massive ornaments of Irish gold. The ancient goldsmiths held high social rank in early Irish civilisation, and were even regarded with superstitious veneration by their ignorant neighbours, who believed them to be endowed with magic powers as exorcists and charmers.

The tradition of the gold mines in Wicklow never was completely lost; but the secret remained for hundreds of years at a time closely kept among a few families in that remote neighbourhood.

About 1780 a schoolmaster in the neighbourhood of Arklow discovered the existence of alluvial gold in the Ballinvalley stream, now the Goldmine river, rising in the Croghan Kinshella, and flowing into the Aughrim river at the beautiful and celebrated vale of Avoca. He kept the secret well, and gradually enriched himself, much to the amazement of his neighbours, who firmly believed that he had sold himself to the Power of

Darkness; but in 1796, when a man crossing the stream found a nugget twenty-two ounces in weight and disposed of it for eighty guineas, inquiries were set on foot, and the secret leaked out. The report spread like wildfire, and operated so powerfully upon the minds of the untutored peasantry that they forsook every other employment and flocked in thousands to the newly discovered Eldorado. All hoped to realise the fortunes of Ali Baba or Aladdin. Steady, sensible men who had never wielded a pick or handled a spade laid down their pens on their desks and thronged to the slopes of Croghan Kinshella. From the 24th August, when the news became publicly known, till the 15th October, when the government took possession of the diggings, over two thousand five hundred ounces of gold were found by these inexperienced miners, and sold by them for about ten thousand pounds. The process of mining was extremely simple. They dug up the sand from the river-bed, washed it, and then picked out the granules of gold, which they preserved in quills to bring to the goldsmiths.

After some time, the locality becoming the scene of great disorder, the authorities took possession of the mines and ordered two companies of the Kildare militia to the spot. A sum of money was then issued by the Government for employing skilled labour and conducting the mines under scientific principles, a separate account being kept of the net profits for payment to whoever should prove their title thereto. It was too late, however. The most of the gold had been removed by the peasantry, and the produce of the mines after this barely paid the cost of working them. In 1798, during the rebellion, the Government found it necessary to withdraw the militia from the spot, and the operations were consequently discontinued till 1801, when they were resumed, and miles of new trenches opened in the Croghan Kinshella. Numerous veins of quartz were discovered in these works, but no gold, upon which the Government finally abandoned the undertaking, having spent nearly all the surplus in fruitless attempts to trace the gold to its source.

Since that time, mining has been carried on with varying success by public companies and private individuals, and the peasantry have at rare intervals found occasional morsels of the precious metal; but the *sacra auri fames* has long since worn off, and searching for gold has of late years been confined to skilled workmen employed by public companies.

About 1840 a company took lease of the district, and carried on the operations for some years under the superintendence of an experienced miner, employing about fifty persons at the work. The process was rough, but the results proved fairly remunerative. In 1869 the mines were again opened, and were worked till 1881, during which period the gold was continuously found, though in small quantities.

In almost every case where gold has been found in the beds of tributaries it has been found beneath the deep alluvium of the rivers into which they flow. As it has been obtained in so many of the tributary streams of the Aughrim and Avoca, it seems reasonable to suppose that it would be also found deep beneath the beds of these rivers. This, however, has not yet been

tried, so that considerable quantities may yet remain in the alluvium of these rivers, near the several points of confluence with their auriferous tributaries.

A FASHIONABLE PHYSICIAN.

THE STORY OF A CONSULTATION.

I AM a family doctor, with a sufficiently arduous if not over-lucrative practice, chiefly among the lower middle class whose homes abound in a south-eastern suburb of modern Babylon. Some years ago, when I was more of a struggler than I happily now am, I had by good fortune obtained a foothold as medical adviser in the household of a wealthy City stockbroker, who dwelt in a spacious and luxuriant mansion some three miles farther out on the Surrey hills than the then extreme limit of my regular round of visits; and the fees I received for occasional calls to Mount Aureo when Mr Midas Contango had a touch of his chronic tormentor the gout, or his somewhat sentimental spouse—quite a grand dame, however, in her own esteem—was suffering the penalties of systematic outrage on the digestive fit-up of her portly person, were so liberal in their extent as to form in the aggregate no inconsiderable proportion of my modest income.

After my connection at Mount Aureo had continued, to the seeming satisfaction of all concerned, for some two years, I began to receive more frequent summonses thitherward. The only daughter of the Contangos, Miss Muriel, a fine, tall, gracefully moulded damsel of seventeen, who might have stood as a sculptor's model, so perfect was her physique, had returned home for the Christmas vacation from her fashionable Brighton boarding-school troubled with a slight cough. In all respects save this trifling laryngeal affection, she enjoyed the excellent health of which both her parents had had possession in their earlier days, before the indulgences which follow in wealth's wake had made them profitable acquaintances of my own. It was clear enough, too, to me that Miss Muriel Contango's throat trouble was purely local; nevertheless, it was causing serious alarm to the master and mistress of Mount Aureo, who idolised their charming child. The dream of the Contango existence was to mate Miss Muriel to some scion of the aristocracy, their reputation for riches having obtained them the *entrée* to society to which by birth and breeding they were not entitled.

Mr and Mrs Midas Contango had both begun to dread that Miss Muriel's indisposition would culminate in bronchitis or a decline. The slightest cough, the least *ronchus*, raised the grim and terrible spectre of phthisis, and the beautiful young lady was held to be in imminent danger of an early grave. I had examined her chest with the most anxious and minute care, but could discover nothing to justify any fear or even doubt of the correctness of my diagnosis; yet, despite balsamics and sedatives, exposure, however little, in treacherous weather would cause hoarseness and a transitory cough. Indeed, these disagreeable symptoms often manifested themselves without any apparent cause, except, as I judged, the inordinate precautions taken to avert them. The rooms at Mount Aureo were always too hot; Miss

Muriel was overclothed, could not stir out for a constitutional in the garden without a respirator, or take a drive unless hidden in an envelopment of costly furs. When I ventured to hint at this, the invariable reply of the Contangos was: 'Ah! doctor, if we did not take this care of Muriel, how long would she be with us?—the dear child is so delicate.' And nothing I could say would alter their opinion.

One day late in the April succeeding, when Miss Muriel had been coddled up at home for four months instead of being sent back to Brighton to continue her studies, Mrs Contango was more than usually concerned about her daughter's condition. The stockbroker and his good lady had overnight held an anxious discussion. I had made my now usual though quite unnecessary daily visit to Mount Aureo, and Mrs Midas Contango was, in her patronising and yet solicitous manner, bowing me out. I had almost reached the door, hat in hand, when Mrs Contango said with some effort: 'Doctor, you know we have the utmost confidence in you; we carry out your instructions to the letter; but our dear child—'

'Yes, madam; only you will persist in treating her, if I may be pardoned the simile, too much after the manner of a tropical orchid, instead of regarding her as a beautiful plant of English growth.'

'Well, perhaps you may be right, doctor; but we are so very anxious, Mr Contango and myself—you see Muriel is our only child, our sole hope. Now would you mind our asking the opinion of a famous specialist as to the case?'

'Nothing would be better, or more proper. Pray, whom would you like, and when may we arrange, contingent on his being able to come, to have him here?'

Mrs Midas Contango mentioned the name of a very fashionable and expensive London physician with a consultative practice confined almost entirely to the houses of those who had been presented at court. He was certainly not the man I should have chosen, for the faculty rather smiled at his pretensions to pre-eminent skill; and his reputation was far more that of the drawing-room than professional. However, I, a humble if conscientious practitioner, could not afford, had I so desired, to decline to meet him; and I consented to facilitate arrangements for an interview at the great man's convenience.

The fashionable physician drew up in his imposing equipage at the door of Mount Aureo half an hour behind the time appointed, was introduced to his patient, making the while profuse apologies for having been unavoidably detained by a critical case—that of the Duke of Deerwood—to whose house in Mayfair he had been summoned by the Duchess's request to give his opinion as to the treatment adopted by the attendant medical gentleman.

'What!' said the society exquisite, for such the celebrity certainly was—'what!' exclaimed he in grandiloquent tones, striking a theatrical attitude, 'is it that fine young lady we are to consult about? That superb girl, in such perfect condition! Come, confess, madam, that you are only making fun of us.'

'Well,' replied Mrs Contango, impressed, as she was meant to be, by the importance of the pompous personage who was addressing her, 'I admit

appearances are in my daughter's favour, and I hope that you may be able to assure us that her condition is not serious; but she is always losing her voice—always coughing—and if we were not to take care'—A flood of tears drowned the rest of the sentence.

'But,' airily remarked the famous doctor, 'my dear madam, why distress yourself? All may be well. Let me hear from this gentleman, your family attendant, the symptoms as he has interpreted them.'

I gave the history of the case in a few words.

'Well, well; there *seems* to be nothing serious; but we must examine the chest with the utmost exactness to decide that.'

'Pardon me,' interrupts mamma, 'but will you allow me to remain in the room?'

'Of course, madam,' responded the favourite of fortune. 'You have a sacred right to stop here. Pray, sit down.' And then he directed me to commence the examination. I percussed with minute carefulness every part of the thorax, and, as before, could really find nothing abnormal.

'There; you perceive that I have tested with exactness, and the resonance is everywhere perfect.' I made the remark as a mere matter of form, for I had not failed to note that the very superior West End practitioner had not condescended to pay the slightest attention to my proceedings, but was talking in low tones to Mrs Midas Contango all the time.

'Ah, well, now it is my turn,' said he, and with the most delicately impressive care, placed Miss Muriel again in position; not, as I had done, with the arms crossed on the chest, but stiffly extended. In place of telling her to count 'thirteen to sixteen,' he gave her a book and directed her to read a dozen lines, and then to sing the gamut, an octave and a half. The mother was watching all this in admiration and devouring every detail.

'Ah! humph!' said the oracle; 'it seems there is something—but extremely difficult to differentiate.—Let us hear what percussion yields.' And his style was truly enchanting. Every tap with the fingers was given with a flourish and a graceful sweep worthy of the most expert professor of sleight-of-hand that ever entertained a countess's guests. There was a moment of studied incision, and then, with a covert smile, turning to me, he said: 'There it is. Listen, my dear young friend,' as he beat his digital drum, now on this side, then on that. 'Tick-tack, tick-tack.—Hark! do you hear it? There is a very appreciable difference in resonance; when I say "appreciable difference," I do not say an enormous difference—no—but there it is!'

'For my own part, sir,' I returned, 'I cannot, with all deference, detect the slightest difference.'

'Oh! very likely; but there, nevertheless, it is.—Now come, however; though—having ascertained the truth about the case—my time is short, let me convince you. I will turn my back to the patient, and you shall again percuss. I will tell which side you are tapping upon by the variation in the sound.' He turned round, and I percussed as equally as possible the two sides of the thorax. 'You are on the left side.' He was quite right! In a moment, however, my surprise was changed to admiration of the fashionable physician's smart

audacity. His professional—nay, I yet hope I may more truthfully write it unprofessional—trick was obvious enough, but performed with such perfect aplomb that I was duped even whilst taking part in it. He had turned his back to the patient, to Mrs Midas Contango and myself, but he was looking into a large mirror above the console which faced him!

What could I do? I was mute. The tables had indeed been so completely turned upon me that I had nothing to say.

'Madam, I must not alarm you,' observed the triumphant specialist to Mrs Contango, who was in blissful ignorance of the deception; 'these delicate gradations in tone can only be at once detected after immense practice, only by those who examine a stream of patients; but there is something on the left side of your daughter's chest—nothing serious—so little, indeed, that my young friend here has been unable to find it; but there it is.—And now, the examination being complete, permit us to consult as to the treatment, and then I must go, or I shall incur the displeasure of a noble but somewhat impatient patient of mine.'

When we were alone, I again expressed my incredulity, delicately hinting at my observation of his ruse.

'Tut, tut! my dear young friend,' said he, testily, 'you have not yet grasped the situation.—Now, here you have a girl who coughs and has been hoarse for a long time—then how the deuce can you get over the fact by telling the parents that there is no cause for it! Very likely there is nothing the matter with her; but why does she cough?'

'That was exactly what her mother said to me.'

'There you are; and mamma was quite right; there must be some cause for it. We may not be able to lay our finger upon it, for we must examine and understand our patients thoroughly very often before we can make out their ailments, and then one finds the mischief, because you see, we are expected to discover it.'

'But suppose there really is nothing.'

'Nonsense! There always is. But even if there were not, we are equally bound to find it; for if you tell these anxious people, "I can discover nothing wrong," they will naturally put it down to your ignorance, and send for somebody else who has knowledge enough of human nature or sufficient *savoir faire* not to be embarrassed with so small a difficulty.—Now, do you see my meaning?'

'Theoretically there is nothing, practically there is.'

'You may put it so, if so it please you. But I assured you that there is—and there is—your vigilance and punctilious exactitude notwithstanding, a little convenient difference in resonance. The mamma heard the remark, as I intended her to do; she has not the remotest idea what it means—why should she have?—but she is perfectly happy now that the cause of her darling's cough has been discovered, because she thinks, the cause being known, the cure will follow. The more unintelligible the explanation, the more convinced is she of its correctness. One may remedy, you know, a difference in resonance; but how can you pretend to cure a person whom you persistently declare to have nothing the matter with her?'

I began to understand.

'Now,' continued this consummate reader of Society's intelligence, 'I admit this is not science'—

'Nor what the schools and our academical training teach us,' hazarded I.

Quite so, my dear fellow; but accept for once the tuition of a man who has not altogether failed in his profession. What I have taken the trouble to demonstrate to you gratis is a good working rule—smelling a little, perhaps, so to speak, of the shop or of legal tape—but if our patrons are satisfied, our patients made happy, our reputations advanced, can we wisely permit so trivial a matter as departure from slavish adherence to what is miscalled principle to stand between us and success?

'Well,' admitted I, a little sadly, 'perhaps you are right.'

'Of course, I am, my dear young friend. I am a cynic, but I succeed. I have been, for instance, beseeched to meet you here to-day.—And now for treatment.'

A little delicate counter-irritation was suggested and agreed on; then the fashionable physician stepped into his elegant turn-out before the door of Mount Aureo, amid the profuse thanks of Mrs Midas Contango, a hundred guineas richer for his half-hour's visit. As he shook hands with me, on throwing himself back among the cushions of his brougham, the famous expert smilingly whispered: 'You are too modest, my ingenious young friend: you have already the science of medicine at your finger-ends; why not acquire the art also?—Adieu!'

One rarely takes part in a consultation without learning something; but I never obtained such valuable practical knowledge from any meeting with a brother professional as I did in that inglorious scene in the drawing-room of Mount Aureo, in which I was so sadly let down, for a time at least, in the estimation of Mrs Midas and Miss Muriel Contango.

Miss Muriel subsequently recovered her temporarily defective resonance sufficiently to gladden the hearts of her parents by making a marriage—at their cost—into a noble house. I still have the pleasure of ranking her among my patients, but for no organic or other serious ailment; and I have it on excellent authority that her husband, Viscount Barrenlands, would be extremely glad at times, when he has been inordinately extravagant with his unearned increment, if Lady Muriel's vigour of voice and physique were both a little less robust.

BRIDE-ALES.

In olden times this institution was most popular in England; but since the introduction of wedding presents, it has gradually died away. The bride-ale was specially raised in order to give the young couple a start in life; but the custom only remains in the more scattered hamlets of this land. The words 'bride-ales,' with their companions 'bride-bushes' and 'bride-stakes,' obtained their names from brides selling ale on their wedding-day, and receiving goods or money from friends as payment; and from the bush at the end of a stake or pole being the ancient sign for

country alehouses. The court-rolls of a Shropshire borough in the fifteenth year of the reign of Elizabeth contain the following relating to bride-ales: 'Item, a payne is made that no persons that shall brew any wedding-ale to sell, shall not brew above twelve strike of malt at the most, and the said persons so married shall not keep nor have above eight messe of persons at hys dinner, within the burrowe; and before hys bryde-ale daye he shall keep no unlawfull games in hys house, nor out of hys house, on pain of twenty shillings.' From this we should gather that bride-ales were conducted in those days with much that was objectionable.

When a wedding was arranged, friends willingly started a bride-ale, and thus the expenses of the ceremony were defrayed, and a goodly sum handed over to the couple for the better furnishing of their new home. Thus the primary object of this custom was a charitable one. Indeed, in former times, many a worthy couple could not have afforded the expenses of new furniture, &c., without this mutual aid of their acquaintances. Many instances are mentioned of royalty giving money for this purpose. The expenses of the privy purse of Henry VII. point out many such as the following: '1530, January. Item, the xij daye paid to Bowlande, one of the stable in reward, toward hys marriage, xls.'

Princess Mary's privy-purse expenses show contributions of three shillings and fourpence and seven shillings and sixpence to poor girls on their entering the marriage state. During the time of Elizabeth this custom was carried on even by the nobility. There is mention made of a great bride-ale at Kenilworth Castle in 1575 'with a large variety of shows and sports.' This was the order of ceremony among the better classes: The bride was placed by herself in a seat of honour, and when the time for the reception of the goods arrived, her husband sat by her side; then the father of the bridegroom (should he be the heir) entered with a beautifully carved box of wood, containing the deeds of the land, &c., and there he promised to make them his heirs for aye. The houses were decorated with rushes and flowers, roses being the favourite. Many devices were worked, as dishes, stools, chairs, baskets, hampers, &c., and then hung about the walls as tokens of good-will.

In the seventeenth century the presents were generally made in the church at the time of the marriage service, being cast into a large basin or dish, placed there for the purpose. About this time bride-ales came to be abused, for many turned the rejoicings into a time of feasting and drinking, and it became as bad as the time when wine and sops were partaken of in the church after the service was over. In an inventory of the parish church of Wilsdon, Middlesex, about 1547, mention is made of 'two masers' that were appointed to remain in church to drink from at bride-ales.

Morant says of Great Teldham, in Essex: 'A house near the church was anciently used and appropriated for dressing a dinner for poor folks when married, and had all utensils and furniture convenient for that purpose.' Many other writers mention places where rooms were set aside for this custom.

The 'penny bridal' of Scotland is one of the

many forms under which the bride-ale existed. At one time this custom was almost universal; but owing to abuse, many efforts were put forth to abolish it—to no purpose. The 'penny wedding' thus fell into disrepute with the respectable community, and thus thousands who would have benefited by this useful custom now receive no help. In Aberdeen, such a gathering was called a 'siller wedding,' and often as many as two hundred guests assembled, generally at an inn; and a goodly sum was collected for the couple.

In Cumberland, Westmorland, and other parts of the north of England, weddings were celebrated publicly, and called 'bride-wains,' or 'bidden weddings.' Every publicity was given to the 'coming event,' and advertising was even resorted to. Such an advertisement appeared as late as 1803. The people assembled at some convenient place, and each placed something in a plate or bowl put for the purpose. It was the custom to give a servant-girl who had retained her situation seven years a copper kettle. The word 'bride-wain' obtained its name from the poorer people before their wedding sending wains or wagons to receive corn for their first sowing, and other presents. Hutchinson, writing of Cumberland customs, says: 'Newly married peasants beg corn to sow their first crop with, and are called corn-laiters.' At some of these 'bride-wains' there was a 'dog-hanging,' or 'money-gathering.' After the repast, a pair of gloves were sold by auction, and he who bade highest had the privilege of kissing the bride. This also increased the collections at these bride-ales.

SHIRLEY POPPIES.

The writer had the pleasure of announcing to the readers of this *Journal* (May 1885) the possibility of growing the *Edelweiss* on rockwork without the trouble of visiting Switzerland to see it. May he now have the honour of introducing the flower-lovers of *Chambers's* to another lovely plant newly introduced, in fact newly evolved—the Shirley Poppy? We are all accustomed to the flaunting but beautiful if deciduous poppies of our fields and gardens, and we all remember the lines of Burns:

But pleasures are like poppies spread;
You seize the flower—its bloom is shed.

Many of our poppies, however, have charming double flowers of glorious colour, and are not so transient as the poet would infer. The Shirley Poppies rejoice in being different from all other poppies, poetic or otherwise. They are pronounced by competent judges to be the loveliest in cultivation, and have been produced by the loving care and discrimination of the Rev. W. Wilks, Vicar of Shirley, a celebrated florist, who with the ordinary wild poppy began a series of experiments, carefully selecting the fittest plants each year, taking the best seed the capsules provided, and thus by a process of natural selection analogous to Darwin's, and a process without of natural evolution, he has almost succeeded in bringing something out of nothing, and creating a thing of beauty to be a joy for ever.

The plants thus produced, and so rigidly watched and tended and selected, seem to give colour to

the doctrine of the survival of the fittest. There they are, truly enough, a new blaze of colour, and unlike any others of their ancestors. The *Gardener's Magazine* says they appear to be 'capable of endless variation, and the characters are usually of a lively order, being chiefly richest rosy-red, violet-crimson, brilliant lake, and tender pink, mixed in the most delightful manner with white.' After this eulogium, who will not grow poppies with their centres white, and white glorifying their margins, and with a prospect of turning out new varieties and colours every succeeding year?

The excitement attending such a simple operation ought to kindle new fire in the hearts of all floral amateurs. These charming flowers have this capital recommendation also: they can be grown anywhere with the greatest ease and without trouble. The *Queen* newspaper says they have been as much talked of as if they had just arrived from New Guinea or any other remote region. It may be added that they are not yet generally distributed, so they will be quite a godsend in most gardens for a long time to come. The flowers are single; and the best plan is to sow the seed as thinly as possible in autumn for spring flowering; and again about the beginning of June for an effective display farther on in the season. In those neighbourhoods where snails abound, the young plants will require careful supervision, as these and slugs of all kinds feed upon them most voraciously. Clumps made with the poppies look exquisite, and we have now said as much as is desirable to put amateurs on the true scent. We have only to add that half a thimbleful of seed, costing sixpence, will add beauty, bloom, and richness to any ordinary garden, if well grown.

SONG—A MEMORY.

When thy burdened spirit fails,
Worn with grief and weary days,
And the purple distance sails
In the fading saffron haze,

Droop thy fringed lids, nor sigh,
Should the gathering tears o'erflow;
Sing again the song that I
Sang to thee, long, long ago.

Let thy snowy fingers stray
In among the ivory keys,
While the twilight sinks to gray,
And upswells the sweet night-breeze—

They will find the dear old strain,
Woo'd from out the trembling strings;
They will find it, not in vain,
If thy spirit with them sings!

And though day be overcast,
Starlight glimmers on the sea,
While through darkness, dawn, at last,
Brighter days for you and me!

ON THE EXERCISE OF DISCRETION.

THE 'discretion' which is said to be 'the better part of valour' is not usually understood to be a quality of which the possessor has any particular reason to feel proud; it is looked upon, indeed, as an indication of something very like cowardice. Cowardice in a man, fortunately for this country, is looked upon by all classes, from the ragged vendor of evening newspapers to a prime minister, as the one social sin for which there is no forgiveness, hence the imputation becomes a serious one. As a matter of fact, however, it is pre-eminently true that 'discretion is the better part of valour.' Valour without discretion, so far from being a useful quality, is apt to be a very dangerous one. The valour of our private soldiers is beyond question; but the exercise of the discretion which controls it is fortunately not left to them; if it were, we should have splendid instances of bravery, no doubt, but our army as an effective weapon of war would soon cease to exist.

Discretion is the tie which binds together all the faculties of the mind; without it, they have no more cohesion than a loose bundle of sticks. He who enjoys the proper exercise of this faculty enjoys it, unfortunately, to the exclusion of countless numbers of his fellow-beings. It is a faculty which can be developed by practice, and it can be lost by disuse, following in this respect the Darwinian order of things. Soldiers taught to perform their different evolutions at the word of command, act mechanically at last, depending upon the volition of somebody else instead of their own. Relieved from the necessity of considering what course they would under particular circumstances adopt, they cease to consider about it altogether; and if at some supreme crisis they are deprived of those who have done the thinking for them, they are as incapable of intelligent and combined action as a flock of sheep.

The policeman, on the other hand, is placed in a position peculiarly favourable for the cultivation of discretion. His whole life is a constant exercise of that faculty, and undoubtedly the

intelligence which characterises the average policeman, especially the metropolitan policeman, is due in great measure to his being so obliged to exercise it. Stalwart in body, the policeman must also be active and robust in mind; for occasions are constantly occurring wherein he has to bring the best faculties of his mind into play. He has to remember his orders and instructions, decide at a moment's notice, without assistance and on his own responsibility, whether any one of them applies, and if so, how far to the case brought before his notice, and then unflinchingly carry it out. Bearing all this in mind, and that it applies to beginners in the force as well as to experienced hands, the marvel is not that the police make occasional mistakes, but that they make them so seldom. The exercise of this discretion is not so easy a thing as unreflecting people would imagine: there are people who are constitutionally unable to exercise it at all. Some years ago a large body of Sikhs were imported into one of our principal eastern colonies for the purpose of strengthening the police force. They proved to be and have ever since been treated as perfectly useless for the purpose, inasmuch as they were quite incapable of exercising any discretion, or, in other words, of thinking for themselves. Tell a Sikh to do this, and he will do it; not to do that, and he will not do it. But try to instruct him that under certain circumstances he must do this, and that, under certain other circumstances, he must do that, or do neither, as the case may be, and then place him on his beat, and you will find that you have transformed a splendid soldier into a bewildered and somewhat dangerous official. Employ him in a military or semi-military capacity, and he is all that can be desired.

To some extent, a similar disuse of the reasoning faculty entails a similar lack of discretion on the part of domestic servants. Accustomed to specific orders before doing anything outside their ordinary groove, they soon cease to do anything at all outside it without them. They seem to arrive speedily at the conclusion that 'Think-

ing is but an idle waste of thought,' and so in great measure manage to dispense with it. The old-fashioned habit of beginning fires on a certain day and leaving them off on a certain day had more reason in it than people who shiver over a fire in June if the temperature goes down a few degrees, are apt to imagine. Few housemaids could be safely entrusted with a discretionary order as to the lighting of fires in the morning. Some bitterly cold morning in September you give orders for a fire to be lighted in the breakfast-room; and as the wind remains in the north-east for the next few days, you see no reason to countermand the order. Suddenly the wind shifts to the south-west, and it becomes almost oppressively warm. You come down to breakfast, and the first thing that meets your eye is an unusually large fire blazing merrily on the hearth. You fling open the window, and when next you encounter the housemaid, tell her that you did not want a fire in the breakfast-room on a hot day like this. She regards you with an astonished and somewhat puzzled air as she replies: 'Please, ma'am, you told me on Tuesday to light a fire there in the morning.'—'Yes; but Tuesday was a bitterly cold day, and to-day is a very warm one. I don't want a fire there regularly as yet, but only when it is cold.' But Jane's mind, having become more or less like that of the Sikh, is incapable of retaining an idea which involves what lawyers call 'a contingency with a double aspect,' and she has now her orders, she considers, *not* to light the fire. Accordingly, when, three or four days later, there is a frost in the early morning, and you feel when you arise as if you had been suddenly landed in the arctic regions, you have a splendid opportunity for curbing your tendency to irascibility when, on entering the breakfast-room, you find not a vestige of a fire, and the window wide open.

Paradoxical as it may appear, the persons who suffer most by the want of discretion are those who possess it in the highest degree. Mental culture and refinement, whilst giving to their possessors a sense of delight and enjoyment in things unintelligible to vulgar minds, bring also a delicacy of taste and feeling which make all that runs counter to it inexpressibly painful. A man may be cultured and refined without being over-fastidious; but undoubtedly things offend him which give no offence whatever to uncultivated minds. A vulgar remark, an observation which a moment's thought would have taught the maker of it must be disagreeable to some person present, jars upon his nerves in a manner positively painful; whilst the utterance of it, even if it were brought to his or her notice that the remark had wounded the feelings of some person present, would not feel the least disturbed, and probably make the matter worse by an ill-framed apology.

When we come to consider the use that is habitually made by many of the faculty of speech, we have indeed cause to lament the terrible want

of discretion which governs it. Surely there must be something wanting in our system of education which allows successive generations to be launched into social life without having been taught how to control that unruly member the tongue. Those who have had more fortunate experiences, or whose own powers of reflection, have convinced them of the necessity of such control, have indeed cause to be thankful. They are saved from the commission of countless mistakes, and from being the cause of frequent injustice and much misery. The man who has learned or who has taught himself to think before he speaks has acquired the habit of ascertaining almost instantaneously whether what he is about to say will be suitable under all the circumstances of time, place, and company. What a blessing it would be if everybody else had acquired this habit and acted upon it! With many people there is no pause for reflection at all between the idea that comes into the brain and the expression of it that comes out of the mouth. So eager are they to talk, that they have no time to consider whether what they are about to say is worth the saying, or had better be left unsaid. So incapable are they of entertaining two ideas simultaneously in their heads, that the possession of one makes them uncomfortable till they have got rid of it. The name of some one known to the company is mentioned at table, and it immediately reminds one of these individuals of some story or rumour or scandal about this person which he or she has lately heard. At once, and without the slightest reflection as to whether the story may be true or not, whether there are friends of the person present to whom it may be offensive, enemies to whom it may be grateful, or servants attentive to pick up any gossip or scandal to retail with embellishments in the servants' hall, out it all comes; and the thoughtless babbler, instead of feeling remorse at having done a possibly cruel wrong to an innocent person, is smilingly complacent at having contributed to the general amusement.

Worse than this is the deplorable lack of discretion which prevents the presence of young persons, and even of children, from being any restraint upon this fatal rage for speaking. That reverence which even the heathen poet felt was due to youth, 'Maxima debetur pueris reverentia,' is totally wanting in many who would be highly indignant at the insinuation that their morality could be compared at all with that of a pagan. Incalculable is the evil which 'is wrought by want of thought' in this respect; and it can only be by want of thought, for nobody with any sense of decency left would wantonly incur the risk of corrupting the minds and defiling the imaginations of the young and innocent. The extraordinary part of it is that people who have lost all discretion in this respect seem so utterly unconscious that they are doing anything reprehensible. This want of thought must be to some extent an incapacity for thinking; phrases which they hear, or which, parrot-like, they recite, having no meaning for them. They will hear with unruffled composure the anathemas upon him 'that shall scandalise one of the little ones,' and wonder possibly how people can be found so wicked as to do it. Very

likely they will think of some of their friends to whom the words might apply; but the last persons whom they would think of condemning upon that head would undoubtedly be themselves.

JOHN VALE'S GUARDIAN.

CHAPTER XXXI.

M. JOUSSERAU had been to Paris, and was now expected back again. He had devoted the whole of the late autumn months to the execution of a picture of English country life, nothing less than a harvest-home supper; a rather difficult subject, it may be confessed, for a French artist to handle. He had made studies from a score of the yokels of the neighbourhood, and had found ample opportunities of studying his theme *en bloc* at the feasts given by Shorthouse, Gregg, and Day. He had had no mind to wait until spring for the exhibition of his work, and indeed at this time the school he represented and the authorities of the Salon were not very much in harmony. Courbet was rising to his glory; but the poetic school, with Corot at its head, still held its place, and, for a poetic school, had a good deal of fight in it. The salons of the great picture-dealers were the nursing-ground of realistic genius in those days, and M. Durand-Ruel gave Jousserau's picture a home and a welcome in the Rue Lafitte. French art was a little more home-loving thirty years ago than it is even to-day, and when painters ran abroad at all, they went to Constantinople, to Naples, to Madrid, or Cairo. None of them had dreamed of invading England, where the local colour was popularly supposed to consist of one dim universal gray; so that Jousserau's little bit of truth, cut out of the living panorama of English life, took Paris quite captive for a week or two. The little man was fêted and stormed at, praised and abused beyond his merits or demerits. He became quite a personage, and his picture was sold at a price which astonished nobody so much as the painter, before it had been on exhibition a fortnight.

He had written a painfully worded letter announcing his return, and Isaiah was at the railway station to meet him, pleasantly conscious of the increased importance of his own personal aspect, and prepared for Jousserau's astonishment at the pair of steppers. These he had left in charge of a street-boy whilst he warmed himself at the waiting-room fire. He had not been there long when he became aware that a shuffling step had paused upon the platform, and that a nose was flattened against one of the window-panes. Somebody outside was peering at him, and he was not long in discovering that the somebody was Mr Orme. Tobias was hatless, and his gray unvenerable wisps of hair were waving hither and thither in the frosty wind.

Isaiah, deserting his comfortable place by the fire, walked on to the platform to look at him. 'Hillo!' he said, with no great favour. 'What brings you here?'—Tobias stretched a pair of dirty blue hands abroad, and stood there trembling.—'What's the matter with you?'

'Mr Winter,' said Tobias, 'I am a wretched outcast. I have only had one meal for three days.'

'Eh?' returned Isaiah. 'What?'

'Don't think I mean to be impertinent, sir,' Mr Orme pleaded; 'but if it hadn't been for me, sir, you might have adorned a very different sphere. It was my discovery, Mr Winter, and you profited by it. If I had had only a little money, I might be rolling in thousands now.'

'You've got no claim on me, you know,' said Isaiah. 'You've got no right to come and ask me for a penny-piece.'

'I know I haven't, sir,' the wretched object answered, weeping; 'but I'm in great distress. I had to walk about the fields last night, Mr Winter. I'm nearly dead. I wish I were. I was brought up by respectable parents, Mr Winter, who never expected me to come to this.'

'Ah!' returned Isaiah, 'you've lived to be a credit to 'em.'—It was needful to be gruff with Tobias, because he meant to help him.—'There's a shilling for you.' He dropped a coin into the dirty outstretched hand and turned away; but Tobias came shuffling after him.

'I beg your pardon, sir; you have made a mistake; you have given me a sovereign.'

'Well,' returned Isaiah, with an open burst of anger, 'can't you hold your jaw? D'ye think I'm such a fool as that? Get out with you, and let me hope I've seen the last on ye.'

'Yes, sir,' returned Tobias, and so vanished, hugging the sovereign greedily. He was back two minutes later, held in ignominious custody by a porter.

'This chap, sir,' said the porter, touching his hat in respect to Isaiah's broadcloth, 'has been trying to change a quid at the booking-office. He says you give it to him, and I've been sent round to make inquiries.'

At this Isaiah was conscious of a violent shame, and to cover his confusion, shook his fist threateningly at Mr Orme. 'Look here,' he cried, 'I won't be bothered with you. Stupid old owl! Why couldn't you change the money somewhere else?'

'I was very hungry, sir,' Tobias answered.

'Get out of my sight!' roared Isaiah.—'It's all right,' he added to the porter; 'let him go.'

This time Mr Orme vanished finally; and the train shortly afterwards arriving, Isaiah sought the platform, and saw Jousserau alight. The little man was in a state of beaming pleasure, and shook hands with his host a good half-dozen times.

'I have good fortune at Paris,' he said gaily. '—News? Oh yes—the best of news. My picture is paid for, thousands. Not pounds. Shillings. Fifteen thousand.'

Isaiah bent his brows in calculation. 'Why, that's seven hundred and fifty pound,' he said.

Jousserau nodded with a smile, not knowing that he was over-estimating his own gains. 'I shall paint two more,' he said, 'for the same man. He is Englishman in Paris. A lord. Very rich, and very kind.—Oh! I tell you I am made man, Mr Vinture.'

'So am I,' Isaiah answered. 'There's a pair on us.—Where's your luggage? Is all that yours? It's well I brought the brake with me.'

'I have many things,' said Jousserau. 'Some little things for everybody. For Madame Vinture,' he added in a delighted whisper, 'a bonnet. Oh, such a bonnet! The very last bonnet of Paris.' He made a vivid sweep with both hands, as if he

were describing the bonnet's outline, and it were the size of a church steeple. 'Nothing was like it, ever!' he said, laughing outright. 'Madame Vintare shall be proud.—There is something else for you. You, my friend, shall be astonished. You shall wait to see.' With this he hurried up a porter, bewildering the man with instructions; and saw all his property transferred to Isaiah's brake.

The two had no sooner reached home than the little man set to work to unpack; and Mrs Winter, who had received word of the bonnet from Isaiah, stood by in natural feminine expectancy. A wonderful structure came to sight. It was designed, as students of the fashions will remember, on the principle of the Norman arch. The top of the archway was filled up with the most exquisite artificial flowers. The whole edifice was rich with lace, and at the bottom was an enormous bow of the finest pink satin. Mrs Winter, beholding this work of art, clasped her hands together in a blending of wondering admiration and dismay.

'Is that the sort of thing the women gone about in when you've been?' she asked.

'Yes,' said Jousserau gravely. 'All the ladies wear it now—all the ladies of the great life.'

'Oh!' returned Mrs Winter with a long-drawn sigh; 'it might do for them; but a woman 'ud be hooted as wore it in a civilised country.'

Jousserau found this declaration so amusing that he threw himself helplessly upon the horse-hair sofa and laughed with peal on peal. Mrs Winter felt her dignity offended, but she was on the lookout for further wonders and could not afford to say anything. The little man's remembrance for Isaiah was packed in a long wooden case which had a sliding top. This being removed revealed a quantity of soft paper-wrapping; and this in turn being taken away, displayed a bronze figure, draped, poised on one foot and holding the right hand on high. In addition to this there was a tiny clock, with a polished steel rod projecting from it. Jousserau set the bronze figure on the mantel-shelf, and then by an artifice which some Parisian clockmaker had made known to him, attached the rod to a bit of straightened wire-spring the bronze lady held between finger and thumb, and lo! the clock itself became a pendulum, with no apparent source of motion. The good couple sat down before this marvel in a delighted wonder, and there was for a time no end to their admiration.

'You see, Madame Vintare,' said Jousserau, 'it is only in civilised countries people know to make these fine things.'

Whilst they were still at their height of wonder, Shorthouse dropped in, and announced that he was on his way to see Snelling.

'Do not go yet,' cried Jousserau. 'There is somethings for you from Paris, of which I will pray that you accept. Behold it.' He had bought for Shorthouse a noble meerschaum pipe, with a long cherry-wood stem and an amber mouthpiece. The bowl had a Russia-leather silk-lined case to protect it whilst it was being smoked or handled, and the pipe altogether was a very gorgeous affair indeed. 'Will you do me the pleasure to smoke sometimes this?' he asked.

'I should be almost afraid to handle it,' returned the farmer. 'Excuse me, Mr Jousserong, but do you mind a plain man asking a plain question?'

'Why, no,' said Jousserau, looking up at him with raised eyebrows.

'Our vicar,' said Shorthouse, 'is a judge of them things, and he tells me I might ha' paid ten or twelve times as much as I did for them pictures, and have got no better. Now, nothing for nothing is most folks's motto. You don't find these things'—holding up the pipe—'growing on the hedges in your country, any more than we do here. Now, I want to know, and there's no offence meant, Mr Jousserong, what you pick me out to do these favours for?'

'I do not pick you out for favours,' said the little artist. 'For the pictures, it was pleasure to paint them. You, my dear Mr Short-house, are English. You are so much English—excuse me—I cannot tell where else to find you. You are, as they say, John Bull. I want to paint John Bull. I find John Bull; I paint heem. Shall I charge money for what I want to do myself to please? For Mees Cecilia'—he blushed a little here, but not one of his auditors noticed it—'she is charming young lady, very beautiful, and I had great pleasure when I made her portrait.'

'He's got an eye for things,' said Isaiah. 'I never noticed it particular till I see your picture; but I've thought it since, and said it to the missis, many a time, a John Buller lookin' sort o' man I never looked at than he's drawn you out to be. It's as like as one new sixpence is like another, and it's John Bull all over.—He's right, Shorthouse, he's right.'

'Well,' said the farmer, with a complacent waggle of his head, and a smile which would have way in spite of him, 'perhaps he may be.'

If Jousserau had searched for a year, he could have found nothing more flattering to tell him. It was the farmer's pride and boast to be thought English to the marrow, and it cheered him likewise to know that his qualities were evident even to a foreigner.—'You keep an open mind, Mr Jousserong, and you'd seem not to be afraid to speak it.'

'Why not?' the artist asked. 'There is no harm in an Englishman being English. I would not be anything but French of the south if I could help it.'

That was a proposition which in Shorthouse's mind would stand much chewing before it could be assimilated. An Englishman was naturally proud of being an Englishman, but that a foreigner should be proud of being a foreigner, and should not envy a freeborn Briton his characteristics and privileges, was hardly to be believed.

'Come,' said the farmer; 'the kindness can't be left o' one side. I shall be glad if you'll eat your bit o' Christmas dinner along with us.—Isaiah, I shall count on thee and the missis also. Now, that's a bargain, if you please.'

The invitation was accepted on all sides, and the farmer went away, bearing his new pipe in its cardboard box along with him. After the space of two or three minutes, he came back again, thrusting his head round the parlour door and calling 'Zaiah!' in a hoarse and hollow murmur. Isaiah turning at the voice, the farmer beckoned him by a backward motion of the head, and having thus drawn him from the parlour, signalled to him with a certain finger to close the door, and then nodded him sideways down the passage as if in search of a place for private conference. Isaiah

followed him to the front door of the house, and there he paused, with a wink of serious and subtle meaning.

'Zaiah,' he said, 'I've got a notion.' He laid a hand upon Isaiah's sleeve, and leaning forward, breathed a hoarse inquiry: 'Do you think as that young chap can be a sparking up to my Cecilia?'

'N-o-o!' said Isaiah, in a long-drawn growl of almost scornful wonder. 'What's put that maggot in your head?'

The farmer tilted his hat and rubbed his hair with a look of perplexity; then he nodded two or three times with a scowl of indecision and went away without another word. He cast the question he had asked Isaiah up and down in his mind as he drove, and succeeded in coming to no conclusion. He had business with Snelling at the *Barfield Arms*, and went straight thither. He was not quite certain as to whether he had done wisely in inviting Jousserau since Snelling had already promised to be his guest. He knew something of the distaste which existed on both sides, and began to think that he might have proposed to bring gunpowder and fire together.

'I don't think ayther of 'em 'nd quarrel before the women folks,' he said; 'but I'm afraid I've made a bit of a fool of myself all the same.' He decided finally that he would speak of the matter to Snelling, as if it were the most casual thing in the world, and wait for him to offer an objection in case he saw one.

'Bob, ode lad!' he broke out on arriving, 'I just looked in at 'Zaiah Winter's on my way here. That young French chap's back again, and I've asked 'Zaiah and his missis and him to come and tek a bite with us on Christmas day. You and 'Zaiah having made it up again, I thought it was a friend-like thing to do.'

'I shall be glad to meet Isaiah,' Snelling answered quietly; and since he made no allusion to Jousserau, Shorthouse made none either, and the question was allowed to slumber.

It took and kept a place in Snelling's thoughts, however, and the more he looked at it the less he liked it. 'Shorthouse means kindly,' he said; 'but he's a dunderhead. He's got no more thought of insulting me when he asks me to dine with an enemy than he'd have if he asked me to dine with a friend. The man's a fool, pure and simple.'

He grew so hot at times that he vowed over and over again not to go. He would not sit at the same table with a foreign scoundrel who believed and had spoken the truth about him. It was curious, perhaps, but Snelling could not help thinking it rather base on Jousserau's part to have believed the truth. He was quite certain that he himself would have been less ready to suspect evil, and with that amazing dexterity which the foolishlest casuist has at his command when he excuses his own wrongdoing, he made out that though the crime with which his enemies charged him was not anything particularly terrible, it was altogether horrible to accuse a man of it on less than the directest proof. In another man, the intended offence against young John would not only have been inexcusable, but as vilely and basely criminal to Snelling's mind as to that of any normal and right-thinking creature. But he was conscious of his own excuses. If another man had meditated the crime, he would have known how to think about it.

Shorthouse had offered him a chance of reinstating himself on something like the old footing with Cecilia. The girl seemed kinder than she had been, and perhaps repented herself of the refusal. It would be unwise to throw away the opportunity afforded him, and yet his pride could hardly stomach Jousserau's presence.

'Why doesn't he stick to his own folks?' he said savagely. 'If the man's a gentleman, and has a right to hobnob with Sir Ferdinand and my lord, why doesn't he stop among his own people? I reckon the lords and ladies in his own country wouldn't have anything to say to him, and that's why he comes over here, lying away honest men's characters, and poisoning girls' minds against their servants. I won't sit at the same table with the fellow.'

He stayed in this mind obstinately, with occasional feeble gusts which blew the other way, until Christmas eve. He said nothing of his intention to Shorthouse, but relied upon himself to find excuses.

(To be continued.)

BIRD SUPERSTITIONS.

THERE is a widely spread belief amongst school-boys in many parts of the country that it is unlucky to kill a robin, and it is generally supposed that a broken limb would be the probable punishment for so doing. Even the nest of this bird is comparatively safe, though why it should be thus favoured is not quite clear, unless, as has been suggested by some writers, it owes its popularity to the story of the 'Babes in the Wood,' which ballad, perhaps, may also have given rise to the popular notion that the robin will cover with leaves or moss any dead person whom it may chance to find. There certainly, however, seems to be no substantial reason why he should be more favoured than the other members of the feathered tribe, for, after all, he is a very pugnacious and impudent little fellow; but perhaps these are the qualities which have brought him into notice and made him popular.

We are informed in an old rhyme that

The Robin and the Wren
Are God's Cuck and Hen;

nevertheless, the smaller bird does not enjoy the public protection which is afforded to the red-breast, and at one time it was considered the correct thing to hunt the wren on St Stephen's Day. When one was caught, several curious and interesting ceremonies were gone through. The bird was generally carried triumphantly round the town on a pole, and in some cases was afterwards buried in the churchyard. In the Isle of Man, a feather taken from a wren killed on one of these occasions was considered a most efficacious protection against shipwreck for a period of twelve months; and formerly Manx fishermen would seldom think of putting to sea without one. Except in a few localities, the practice of wren-hunting has now, no doubt, fallen into disuse; and at the present day it is kept up as a rule only by boys, who retain the custom for their own amusement.

It is recorded by Aubrey that during a rebellion

in Ireland a party of soldiers who had incautiously fallen asleep would doubtless have been surprised by their enemies had they not been awakened by some wrens pecking on the drums as the enemy approached. On this account the wren was said to have gained the mortal hatred of certain classes in Ireland, who killed the little bird whenever they got the chance. Another reason which has been assigned for hunting the wren is that its destruction was ordered by the early Christian missionaries because the bird was held in the highest veneration by the Druids.

In connection with the wren there is also a curious old Manx legend, according to which there once dwelt in the Isle of Man a very beautiful fairy, whose voice was so irresistibly fascinating that numbers of men were frequently enticed by her into the sea, where they were drowned. Had this state of things continued unchecked, it is highly probable that, sooner or later, the Manx ladies would have experienced considerable difficulty in procuring husbands, for the siren seemed bent upon exterminating all the adult males in the island; but fortunately there at length came forward a knight-errant on whom her charms had no effect. For the safety of his fellow-men, he determined to destroy her, and endeavoured to do so; but at a critical moment she effected her escape by assuming the form of a wren. A spell, however, was cast upon her, compelling her to reappear in the same form once a year; and thus on the fatal day the wrens are hunted in the hope that one of those killed may be the wicked fairy herself, for it is her doom to die ultimately by the hand of man.

Several birds are ominous of evil, and the superstitions connected with them date from very remote ages. Thus, crows are considered unlucky if seen on the left of the observer; and when one of them flies over a house, at the same time croaking thrice, it is held to prognosticate the death of one of the inmates. It is also commonly supposed that death is foreboded by the appearance of ravens or the screeching of owls. Even the pigeon sometimes becomes a bird of ill omen, for when a white one settles upon a chimney it is supposed that a death will shortly take place in the house beneath it.

Grose tells us that it is unlucky to see one magpie and afterwards several others; but, on the other hand, if two magpies are seen it is a sign of an approaching wedding; three, of a prosperous journey; and four, that some good news will be received. Another authority states that a wedding is presaged by three magpies, and a death by four; and according to an old Scotch rhyme quoted by Dr Brewer:

One's sorrow, two's mirth,
Three's a wedding, four's a birth,
Five's a christening, six a death, &c.

That it is unlucky to have peacocks' feathers in a house is firmly believed by many people, this piece of superstition most probably having its origin in the story of Argus, who was changed into a peacock, his hundred eyes—or in other words spies—becoming at the same time the eyespots on the tail-feathers of that bird.

It is only natural that our domestic poultry, during their long association with man, should have given rise to many superstitious beliefs and customs. Thus, from the days of the ancients,

cockerels have been used as auguries, and much importance has also been attached to the behaviour of fowls generally. The crowing of a hen is considered unlucky, and in some localities is looked upon as a foreboding of death. Moreover, the hen that is able to sing like her spouse does not appear to gain a very enviable reputation by the accomplishment, for a well-known adage asserts that

A whistling maid and a crowing hen
Are good for neither God nor man.

The cock, however, can crow to his heart's content so long as he does it at reasonable times and the people living around do not object to the noise. In fact, it is as well, perhaps, that he should crow, for it is an acknowledged fact that by his voice all respectable ghosts are regulated, and that at the first sound of 'cock-a-doodle-doo' they must cease wandering amongst the living and hasten back to Hades.

It is said that in Persia the crowing of a cock is accounted lucky or otherwise according to the time at which it is heard, and should any misguided fowl so far forget himself as to crow at an unlucky hour, he is forthwith killed for his pains—a custom, it is to be hoped, which has its proper moral effect on the Persian poultry.

Fortunately for the present generation, the cocks of a modern farmyard are not in the habit of laying eggs. In olden times, however, they do not appear to have been so considerate, and the medieval poultry-keepers suffered much anxiety in consequence, for they held it to be a well-authenticated fact that a cock's egg hatched by a viper would produce a cockatrice, which was a monster, half reptile, half bird, so venomous that it could kill a man by merely looking at him. Let us hope, therefore, that the hens will continue as at present to monopolise the laying of eggs, even though some of the latter which find their way to our breakfast tables may perchance be slightly addled; for the cockatrice is by no means a desirable creature to have in our midst, and now that it appears to have become extinct few will regret its loss.

UNDER AN AFRIC SUN.

CHAPTER X.

DIGNY's awakening from his stupor was stranger and more wild than his recovery from the stunning fall. It was hours before he could grasp where he was, and then he found himself lying upon the soft dust, so stiff that he could hardly move an inch.

It was dark as ever; and he lay listening and hoping for the relief which did not come, trying to be cool and think out some means of escape, and still telling himself that he had exaggerated, and that Helen was safe: this was but an accident.

As he lay there, longing to rise, and dreading the pain that followed every movement, he became conscious that the air was cool and pleasant and refreshing to his burning brow. Then, by slow degrees it struck him that the wind came in a soft steady current on one cheek; and by-and-by, reason suggested to him that this cool

current of air must come from some opening far away in the great cavern.

He shivered at first at the idea of plunging farther into the darkness, for how did he know where his faltering steps might lead him, and what hideous chasms might be yawning in his path?

Still, there was the cool current of air; so, forcing himself to rise, he began to walk slowly and cautiously in the direction from which it came, with the result that, after about an hour's slow progression over what was really but a short distance, he suddenly caught sight of a pale greenish ray of light, and his heart seemed to give a bound.

The rest was easy. Ten minutes' cautious progress over the dust brought him to the opening, a rift in the rock overgrown with hanging creepers; and pushing these aside, he found himself gazing out of what was like a roughly broken natural window in the perpendicular rocky face of the *barranco*, which seemed to go down hundreds of feet below. How far up, he could not tell.

It was dull, and the wind blew in fitful puffs, which swept the leaves aside, as he stood there for a time, asking himself what he should do. He was in no trim for climbing up such a place as this; but would it be possible to get down?

It seemed a risk; but anything was better than staying in that loathsome place; so, seizing the stoutest creeper within his reach, he began to descend; and, to his great delight, found, after cautiously going down about a hundred feet from creeper to creeper, that the rocky side of the *barranco* grew less perpendicular, and less and less so, till there was no danger, only an awkward descent of a slope, which landed him at last by a trickling stream; while, on gazing up right and left, there were the rocky sides of the ravine, and above them, the dull gray sky, with one tiny orange speck far ahead.

Then he grasped the idea that it was early morning—before sunrise, and that he must have passed the night in a feverish slumber in that dreadful place.

The next step was easy. He knew that if he followed the little stream, sooner or later it would lead him to the seashore; and after slaking his thirst at one of the pools, he bathed his feverish temples and set off refreshed.

Somehow, he could not think about Helen. He felt as if he dared not. He could only dwell upon the fact that a pitfall had been prepared for him, and he wanted to call Ramon to account. Then, too, he wanted to know where Fraser was; why he had not come to his help, and why he had gone off before him.

Strange problems these for an injured man to solve, and the only result of his attempts was for his head to grow more confused.

It was a long and painful journey; and the sun had risen hours before Digby had crept out on to the black sands, where quite a gale was blowing, as the great Atlantic billows came rolling in. Then he made his way round to the little inn.

The landlady gazed at him in horror, and began talking to him volubly in Spanish, to which Digby could not reply.

'The señor—Señor Fraser?' he said; but the woman only shook her head; and he was on

the point of starting off, when Redgrave came hurriedly to the door to ask if Fraser and he had returned.

'Ah, you are here!' cried Redgrave excitedly. 'What does all this mean? Where is Fraser? Why are you hurt? Helen?'

'Yes—Helen?' gasped Digby excitedly. 'How is she?'

'Gone!' cried Redgrave, with a fierce vindictiveness in his tones which made the young man gaze at him wonderingly.

'Gone?' panted Digby, catching sharply at the table, for everything seemed to be whirling round.

'Yes. You do not know? How is it you are hurt like this?'

'Don't question me. A fall. But Helen? Ramon?'

'No,' said Redgrave sadly; 'he swears he knows nothing.'

'It is not true,' cried Digby fiercely. 'It is his work. He planned to murder me, and he has taken her away.'

Redgrave stood gazing at him wildly for a long space; and then gripped him by the arm. 'Come,' he said laconically; and almost ready to fall with bodily weakness, but with his agonising thoughts spurring him on, Digby thrust his arm through Redgrave's and walked with him step for step.

In a few minutes he saw whither he was being led; and ten minutes later, with his heart sinking lower, Redgrave was going down the path which led to Ramon's house.

'You will not find him,' groaned Digby; but Redgrave, whose face looked stony in its despair, made no reply, strode on to the door and knocked.

A quiet-looking Spanish servant answered the summons.

'Where is your master?' said Redgrave sternly.

'In bed, ill,' replied the man.

'What does he say?' asked Digby hoarsely.

'That Ramon is in bed ill.'

'It is a lie!' roared Digby. 'He is not here. Redgrave, get horses; we must follow and hunt him down.'

'What is this noise?' said a familiar voice; and Ramon, looking painfully sallow and ill, came into the open hall. 'Ah, Redgrave!—My dear Digby, what is this? Some one has attacked you?'

'No,' said the young man. 'Yes,' he added fiercely. 'An enemy—a cowardly, treacherous enemy struck at my life, but failed. Struck at my life, so as to separate me from the woman I love. Do you hear? you Spanish dog!—from the woman I love, and who loves me. Now, answer, if you value your life—where is Helen?'

'Helen? Why do you ask me?'

'Because I can see through your cursed plot. Now, sir, once more, if you value your life, speak the truth. Where is Helen?'

'Is the young señor mad, Redgrave?' said Ramon coldly.

'Let me answer, Redgrave.—Yes, sir, mad—mad again & you. Once more, if you value your life, where is Helen?'

'Oh yes,' said Ramon mockingly, 'I value my life.'

'Then where is she?'

'The señor thinks I have taken her away?'

'Don't madden me, Ramon. I am a quiet, easy-going fellow, but dangerous when roused. Where is she?'

'I do not know.'

'You lie, hound!' cried Digby; and, weak as he was, he sprang at the Spaniard and caught him by the throat.

The moment before, Ramon was calm and smooth and soft of word; but, as he felt Digby's hands at his throat, he flashed out into a rage that was almost volcanic. He struggled, but vainly, weak as his aggressor was, for he too seemed to be suffering from some injury which turned him faint. But his words were fierce and strong, and his eyes glittered as he cried menacingly: 'Ah, then, the señor is jealous. He feels pangs, and fierce with rage, does he, because the pretty child is not here!'

'Will you cease this before I strangle you!' cried Digby savagely. 'Where is Helen?'

'Fool! idiot! dog!' hissed out the Spaniard, delivering each word as if it were a deadly blow.

'Don't ask me. Go and ask your cunning false friend. Ask Fraser, when you can find him. He has taken her away.'

'What? It is not true. It is another of your cowardly tricks to throw us off the scent.'

'Indeed? Then, where is Fraser?'

'Murdered, for aught I know, as you tried to murder me,' cried Digby fiercely, but with a horrible suspicion gaining upon him fast.

'You are a boy—a weak boy,' snarled Ramon. 'Your friend, where is he? Ah, it is always the friend who deceives.'

'Ramon, for Heaven's sake, the truth,' cried Redgrave. 'My child! my child!'

'Gone with this idiot's false friend.—There, go, both of you.—I tell you I am ill.—Pedro, your arm.'

He reeled, and would have fallen but for his servant's quick action; and as he was lowered fainting to the matting-covered floor, Digby saw that his head had evidently received some severe injury.

CHAPTER XI.—CONCLUSION.

'I cannot understand it,' said Redgrave wearily. 'I was out the greater part of yesterday; and when I returned, Helen had disappeared.'

'But you heard what he said, Mr Redgrave—Fraser—gone.—Oh, it seems impossible!'

Redgrave sank wearily upon a stone, and let the cool wind which came fiercely from the north blow upon his heated brow.

'You don't speak, sir,' cried Digby passionately.

'What can I say, sir? Tell me about yourself. What did you mean by charging Señor Ramon with an attempt to murder you?'

Digby impatiently explained.

'It is strange,' said Redgrave; 'but I cannot think he would go so far as that.'

'Never mind whether he could or would,' cried Digby. 'Helen—we must find Helen. Is that man deceiving us?'

Redgrave shook his head. 'You saw the condition he was in. There was no deceit in that.'

'Could he have taken her away? Is she hidden at some place he owns?'

'No; it is too improbable. These are not the

days of abductions, young man.—Could Helen have deceived me?' he muttered.

But Digby caught what he said. 'No,' he cried proudly; 'she is incapable of deceit.'

In an instant his hands were grasped tightly, and Redgrave was gazing almost affectionately in his eyes. 'God bless you for that, my boy!' he cried in a choking voice.—'God bless you for that!'

Digby returned the warm frank pressure; and from that moment it seemed as if they worked together with renewed spirit and as one.

'I cannot think that Fraser would fight against me or play a deceptive part,' cried Digby warmly, after a long discussion which followed a vain search for news.

'It is hard to doubt one you believe to be a friend,' said Redgrave. 'But there is no doubt of one thing.'

'And that is?'

'Fraser loved my child.'

'Oh! Impossible!' Digby's ejaculation was full of wonderment and doubt.

'Was she not sufficiently beautiful and true and good?'

'Don't talk like that, as if she were no more.'

'I noticed it from the first,' continued Redgrave. 'I saw how he was struck by her; and in my trouble with Ramon's advances, I found myself thinking how much happier she would be with the quiet, grave, middle-aged student, and I hoped that she would return his affection.'

'And I, sir?' cried Digby resentfully.

'Ah, yes. I saw that you loved her too; but I looked upon you as the hot changeable lover of a day attracted by the first pretty face he saw. But Helen chose you.'

'And Fraser—did he ever?'

'Speak to me? No. I watched him carefully, as a man would who had his daughter's happiness at stake; but he seemed to think that his chances were hopeless, and to acquiesce in your position. I do not think Helen ever suspected his love.'

'She could not. I never dreamed of such a thing.'

'No,' said Redgrave sadly; 'when one is young, one is selfish and blind to all but self. You both were blind.'

'Then all this points to the fact that Fraser has been playing a double part against us all; and that, by some cunning jugglery, he has persuaded Helen to listen to him—to accompany him— No; I'll never believe that. My old friend has fallen a victim to the fate I escaped. No, Mr Redgrave, I can't believe that.'

Inquiries were made in every direction, especially down in the port; but no vessel had touched there; not even a fishing-boat had left the little place; and it was blowing so hard off-shore that no boat would have dared to approach or leave from that side of the island.

'Let's go back to Ramon's; I am sure we shall learn something there,' cried Digby at last. 'That scoundrel is at the bottom of it all, I'm sure.'

They went straight to the Spaniard's house, to meet the English doctor of the place, about to leave.

'Bad, sir—very bad. Quite insensible. Concussion of the brain from a fall or from some blow. The case is serious, I'm afraid.'

Redgrave and Digby exchanged looks.

'Do not have him disturbed. I shall be here again in a couple of hours,' said the doctor; and he walked briskly away.

'No deceit here,' said Redgrave.

'No; but question his man Pedro. Promise him any bribe so that we may get at the truth.'

'We are on the wrong scent,' said Redgrave dismally, as they walked away. 'Pedro knows nothing, I am sure.'

Digby did not feel convinced; but he could do no more, and he followed Redgrave to the desolate home, sick and wearied out, his injuries from his fall forcing him to keep his bed for the next three days, and submit to the doctor's ministering. At the end of those three days, during which time Redgrave had scoured the island in every direction, Digby was able to leave his bed, while the news of the doctor as he tended Ramon was of the darkest hue.

'He may recover; I can say no more,' was the only reply Digby could obtain.

It was on the fourth morning that, with the gentleness of one who bore for him a real affection, sallow and haggard-looking, Redgrave helped Digby to a seat in front of that once pleasant villa, where he could breathe the sweet pure sea-air, and at the same time be sheltered from the fierce rays of the sun, once more shining in all its glory. For the gale had blown over, and the sea softly rippled in the gentle breeze.

'No news—no news!' groaned Digby, as he lay back with his head resting upon the pillow his host had placed at the back of his chair. 'And I used to think this place a perfect heaven!'

That day had nearly passed, and after being within doors during the hottest time, Digby was again seated beneath the tree, gazing sadly out to sea, and asking himself how long it would be ere he recovered his strength.

'I must find them—I must find them,' he groaned. And then he started up, tottered, holding on by the back of the chair, dizzy with excitement, for unmistakably that was Fraser's voice he heard; and directly after the gate was opened, and Helen entered with him, leaning affectionately upon his arm.

The moment they were inside the gate, Helen darted into the house; and from where he sat, Digby could hear Redgrave's cry of joy, and realise as well as if he had seen it that the sobbing girl had thrown herself into her father's arms.

'My darling!' said Fraser softly as he took off his hat and stood gazing toward the house. Then, with a bitter sigh, he turned away, and caught sight of the pale drawn face of Digby standing motionless in the shadow beneath the tree.

'Ah, my dear old Tom!' he cried; and his whole manner changed, as he literally ran at him. 'What is it?—Hurt?'

'Keep back!' cried Digby, in a suffocating voice. 'You mean despicable traitor!'

'What!—Oh, I see,' said Fraser genially; and then a mocking look came into his face as he added slyly: 'Don't take on about it, Tom. We can't all win.'

Digby was too weak to reply; he merely darted a bitter look at his friend, and sank helpless, and with his brain swimming, in the chair. He was conscious of voices and of seeing figures come as

it were through a mist. Then, as he struggled back to himself, it was to find that Helen was leaning over him with her arms about his neck.

'You?' he panted. 'I don't—I don't understand.'

'Have you not told him, Fraser, my dear fellow?' cried Redgrave.

'I? No. Poor boy; he was too cross. No; too upset.—There, Tom, my dear lad,' he cried, going down on one knee and taking his friend's hand, 'don't let's play at cross-purposes.'

'I—I—don't understand,' said Digby hoarsely.

'Soon explained, my dear lad. I was very suspicious of Ramon, as you know, though you snubbed me; and after the last pressing way in which he proposed that we should visit the head of the *barranco*, I felt sure there was something on the way. "It is a plan to get rid of us for the time," I said. And after turning the matter over in my mind, I thought I would let him think we were going, and see us start, and then step back and watch.'

'Yes?' cried Digby eagerly.

'Well, I started early, and left a line for you to follow; and of course I let you go on while I dropped into the bushes and watched—you first, then our friend.'

'Quick! you torture me,' cried Digby.

'That ought not to be torture,' said Fraser quietly, as he glanced at where Helen clung to her injured lover. 'Well, there is little to tell. I saw you go; and an hour after, when I was beginning to grow suspicious of myself and my doubts, I saw Ramon come out, and I followed him right up to here.'

'Yes.'

'Here he came as with a message imploring help for you, old fellow. You had fallen from one of the rocks down by the seashore, and wanted brandy and bandages.'

'The scoundrel!'

'Yes; the scoundrel was very sorry our host here was out—so he said, but glad to escort poor little Helen down to her wounded lover. She followed blindly, thinking only of you; and when she reached the spot, you were not lying there, but a boat was ready, to sail somewhere or another, Ramon only knows.'

'And then, Tom,' cried Helen, who had been listening excitedly, 'Mr Fraser came up as he was trying to drag me into the boat.'

'Come,' cried Fraser, laughing; 'that isn't fair. Let me tell my own story. You'll knock all the gilding off. I don't have a chance every day to play knight-errant.'

'Go on, for pity's sake,' cried Digby.

'All right. He dragged her on board, pushed off; and I thought I was too late; but a wave checked him, and I rushed into the water and got hold of the side. Then he raised the boat-hook and struck me. Well, that naturally made me feel savage. My hand went to my belt; and somehow, I hardly know how, I gave him a topper with my geological hammer; and the next thing I saw clearly was Ramon crawling out of the sea, while I was trying to manage the boat, for a fierce puff of wind came down the *barranco* and nearly capized us.—That's all.'

'No, no; that can't be all,' cried Digby excitedly.

'Well, not quite. The squall increased to a

gale. It was impossible to land; we were blown right out to sea—ocean, I mean—and after being nearly swamped about a hundred thousand times, we managed to get under the lee of Palma, right across yonder; Miss Helen here behaving like a heroine; and there we stayed with some friends of Mr Redgrave till the weather lulled, and then we sailed back. There—that is all.

'No; that is not all,' cried Helen, flushing. 'He has said nothing hardly about his gallantry in defending me from that man, nor about his brave true chivalry all through our perilous trip. You ought to be proud'—She paused, and took Digby's hand between hers as she looked blushing in his eyes—'*We* ought to be proud to have so true a friend.'

'Horace, old man,' whispered Digby as he held out his hand, 'can you?'

'Can I?' cried the other, warmly grasping the extended hand.

An hour later, when they two were alone, and after all further explanations had been given, Fraser said softly, his face nearly hidden by the cloud from his cigar: 'Yes, old fellow, why should I deny it? Who could help loving so sweet and pure a woman? I love her too well ever to let her think otherwise of me than as her true and chivalrous friend. The rest is our secret, Tom.' And after a pause: 'She loves you—her every thought is yours; and as for me, I have but one wish—to see her happy.—There; you see I can take your hand.'

There is little more to tell. Ramon did not die; but he was still anything but the same man, when the Redgraves returned to England, with an escort—Redgrave *père* having found means to pay off his indebtedness to the Spaniard, not a very large amount—when he had successfully parted with his interests in an island of which he had long been weary. How he obtained the money, he did not say. Digby suspected that it came from Fraser; but the latter would not confess.

The other matter was a year later, and there were no cards.

DOGCART REMINISCENCES.

LIFE in a remote country village many miles from a railway gives a good opportunity for studying the dogcart side of rural life. The number of people in the east of England who spend a large portion of their lives in driving is extraordinary; and the effect of this on different characters is well worth observing. It is the ambition of every small tradesman, farmer, and dealer to possess not only a 'hoss and trap,' but also an animal that can pass most vehicles on the road. If it has four sound legs, all the better, provided that it has some counterbalancing vice that renders it not worth selling; for the East Anglian is a thrifty man, and does not care to work an animal whose value might be impaired by the reckless pace at which he loves to travel. 'He is too good for my business,' said a man to me one day as I was admiring a fine young trotter he was driving; 'I want to sell him before I spoil him.'

It was in the long drives to and from our station and county town—the former nine, and

the latter thirteen miles off—that I was best able to study the various characters of drivers. They generally tried their best to beguile the long journey with conversation. One I remember held forth on the temperance question. Another gave me some interesting information on poaching. We were passing through a good partridge country, and the stubble-fields were thickly studded with thorn bushes, to prevent poachers from netting the birds.

'Them bushes ain't a mite of use,' he said. 'A good silk net would go over them like a sheet.'

'Well,' I asked, 'what are the right kind?'

'Little ones,' he answered, 'loose on the ground. They catch the tail of the net, and roll up in it, so that it takes half the night to get them out. The only big ones that are any trouble are blackthorn or ragged boughs. I used to do a lot of it one winter, when I was out of work for fourteen weeks; but I was never fond of it like some chaps, and dropped poaching altogether when I got regular work and left that part. No; I never was caught, though I had a near squeak for it once. That was along of hares. Somehow, dogs were always fond of me, and there was not a greyhound in the parish but would go with me if I whistled to him. There was a chap in our village called Lubbiger—leastways his name was Freeman, but he was never called so. Well, he had a wonderful long dog that could catch most hares, and would carry one a mile if necessary. One day, Lubbiger told me to come along with him, for he had heard that Colonel T.—'s keeper would be away at the dog-show, and there was only one watcher on the beat, a foreigner from the Shires. I was to get a greyhound; so I stepped up the street and saw Mr Jackson's Bob lying outside the butcher's shop. No one was about, so Bob followed me across the meadows quick enough. There had been a lot of rain the night before, so that the hares could not travel well on the ploughed land. We soon had a brace, and then the dogs ran one that took them towards the Home Wood. They killed near a fence; and just as I was picking up the hare I saw the watcher jump out of the wood. Away I went down the side of the hedge; and Lubbiger, who had the two other hares in his pockets, close behind me. "Give me the hare," he cried. I did so, though I thought he had better have dropped it. He could run much better than I, but he did not try to pass me. The keeper got nearer him, and had almost reached his collar, when he swung the hare round with all his might, caught the man on the side of his head and sent him over into the ditch. It was four feet deep, with two feet of water at the bottom, so that he was in no trim for running when he got out. "Now run, Jack," Lubbiger said to me; and away he went with the three hares faster than I could go with none.

'We stopped at a house, hid the hares in a couple of fagots that we bought of the labourer's wife there, and walked up the village to my house, where we put the fagots in a shed. The dogs had gone home as soon as they saw us run, so that no one guessed what we had been after.

"Now, come to the public," said Lubbiger. "He is sure to look in there."

'We had not been smoking our pipes five minutes before our friend came in. "Have you

seen Dick White this afternoon?" he asked the landlord.

"He has not been here since ten o'clock," he answered, "when he came in with his greyhound."

"I knew he had gone to the dog-show! He had had the impudence to enter his dog, for he said it had killed more hares than any in the parish, and so ought to get a prize."

"A brindled dog, is it not?" said the keeper. "Then that is the man I saw to-day near the Home Wood, and a tall fellow with him with a long coat on. I should have caught them easily; but I twisted my ankle jumping the brook, and had to run through it when they crossed it again; that is why my legs are so wet."

"I saw he had changed his coat; and so had Lubbigger, which was lucky, for I saw the keeper look at him once or twice. But he did not spot us."

The idiosyncrasies of professional drivers are always strongly marked. The life is one that allows a man's natural bent to develop. Dickens has immortalised two very different characters in Mr Weller, senior, and Barkis, both of whom owe much of their peculiarity to their life on the box: the talkative, good-natured, liberal Weller to the pleasant and honoured seat behind four good horses, with plenty of tips and a welcome at every inn; the taciturn and miserly Barkis to the side of his tilted cart, and the long, dull, and frequently solitary drives through country lanes. The taciturn driver becomes morose, the cheerful more talkative; the sociable, I am sorry to say, generally drunken, and the thoughtful one epigrammatic. Not long ago I revisited the old place, and renewed my acquaintance with many of the carriers and drivers I had long known. In the five years that had elapsed since I had last seen them, each one's characteristics had become more sharply defined. The epigrammatic man was really almost unintelligible at times. "What kind of man is the new tenant at Stowe Farm?" I asked. "Wonderful fond of rum and porter, sir.—'How is Smith doing now?' 'Nothing wasted in that house, sir.—'Glad of it,' I replied. 'What he can't drink, the missus does,' replied John.

The talkative driver is almost invariably a bad one. He may be all there over a difficult bit of road, or determined enough with a restive horse; but in a long drive he is almost certain to become careless, and the result is frequently broken knees. Accidents seem generally to happen in unlikely spots. I have been in a good many, and never saw a horse fall on a steep hill; and only once a collision, and that a slight one, occur at a dangerous corner. A gentle slope down which a horse trots with almost a slack rein is generally the place where he falls. One bad collision I was in took place on a brilliant moonlight night. I was returning from a day's shooting, and had hired a trap from an innkeeper who was also a 'vet.' There was a slight frost, and the air seemed wonderfully clear. The horse was a good one and fresh, and we were going merrily at about ten miles an hour over a level piece of road with low hedge on each side. A little farther on, that on our right was remarkably high, at least ten feet, and threw a dense shadow completely across the road. Just as we were near this spot, a tall

dogcart emerged from the darkness. A shout of 'Where are you coming to?' a crash, and then I was shot on to the grass by the roadside, the vet. went head over heels over the splashboard, while my gun rattled on the road between us. The mare had broken both traces, and was galloping off like a mad thing. The vet. lay groaning pitifully, and I was much distressed on his account, for I thought the least one could expect from the noise was a broken leg; but after feeling himself all over, he said: 'No; I don't think I am hurt at all.'

"What! doctor, is that you?" said the man in the dogcart when he heard the voice.

"Why, Mr Tom," said my man, "whatever were you doing?"

"Oh, I thought you could see me all right. I saw your trap quarter of a mile away, so I did not trouble to pull to one side much. I am very sorry; but if my trap is all right, I will drive your gentleman wherever he wants to go to."

We disentangled the two carts, and found that neither was much damaged. The young farmer insisted on staying to look for our horse, as I would not consent to his sister, who was driving with him, being left to walk home while he took me towards my destination. The girl seemed to think little of driving alone with only one trace and a broken kicking strap, and said Tom must certainly stay and do what he could to make up for his carelessness. Luckily our mare had her head away from home, and so did not go far. We mended the traces with string, and finished our journey without further mishap.

Horses are very clever at avoiding collisions on dark nights, and their sight is, I fancy, much keener than men's. More than once have I, when unexpectedly benighted, been indebted to my pony's quickness for my safe arrival. One day the train I had been to meet was very late; the evening was dull, and heavy clouds were gathering in the westward, and we were still two miles from home when twilight had disappeared completely. There was one very bad piece of road before us, a narrow place overhung by trees, with a steep bank on one side, and a narrow but rather deep stream on the other. The darkness was intense under the trees. Suddenly my cob, which was going very freely, swerved to one side, drew the cart close to the bank on the left and stood still. I then heard the rattle of a wagon, and shouted. A beery voice answered, and an empty wagon with two horses came past at full trot, so close that I thought we must have been smashed.

This habit carters have of driving their wagons back from market at a trot is a most dangerous one. A nobleman who lived near us had a narrow escape from a serious accident from this cause. He was driving a team in a brake, and on turning a corner near his park gates met two wagons racing abreast down a steep hill. There was not room to pass or time for the heavy cart-horses to pull up, so Lord T—— pulled his horses on to the roadside, and put the near wheels and horses into the ditch, which was fortunately not deep. The grooms got to the leaders' heads and quieted them, so that not much harm was done.

The distance traversed in the course of their journey by dealers, excisemen, and other people who have to live largely in their carts, is extra-

ordinary; and yet their horses rarely seem either sick or sluggish. I remember one man making a bet that he would drive his horse, a well-bred but vicious old screw, fifty miles a day for six consecutive days on the 'Great Road,' the coaching route between London and Norwich. A neighbouring magistrate heard of it, and interfered on the fourth day, so that the journey was not accomplished; but I do not think the horse would have been taxed beyond its powers. The cart was light, the road good, and the animal had much more than its usual allowance of oats. Except in country districts where roads are good and railways few and bad, long distances are not frequently driven now. How many gentlemen have ever had occasion to drive a single horse fifty miles in a day? yet in the last generation such a journey was of no uncommon occurrence. I heard of one old gentleman who, even when the Brighton line had become famous for its speed and comfort, always used to drive to town, and used to take one horse through in the day.

I think our forefathers understood the art of driving long distances better than we do, and probably their animals were specially bred for endurance. There are possibly more first-class horses in England at the present day than at any previous time; but I do not think the proportion of hardy useful animals is so great. There may be more extremely valuable, but few will deny that there are also more fast, weedy wretches that could not do six hard days' consecutive work to save even their own or their masters' lives. Those who have read the *Romany Rye* will remember the directions given there for riding a horse on a journey. The gentle walk at starting, the steady trot after a mile has been covered; then how, after ten miles or so, the rider is advised to stop for breakfast, and enter into conversation with the hostler on the markets, coaches, and so on, until the horse has got through most of his corn before going to look after his own food. Forty miles a day, says the author—no mean authority—can be covered, and that for many days together, if the horse is well up to your weight. Now and then the dealer finds that, in the raw colt he has purchased from a drove of Welsh ponies or shipload of foreign cobs, he has a regular flier. Then he is very mysterious about his new acquisition; talks vaguely of its powers, but is careful not to let them be seen in public until he can secure an advantageous match with some farmer who fancies he has the best trotter in the neighbourhood. I knew of one who sold for one hundred pounds a pony he had bought out of a drove a few months before, for twelve pounds. Lord B—— had offered that sum for any pony in the neighbourhood that could beat one he intended to run in a match over a two-mile course. It was a proud moment for the pig-dealer when, in the last quarter of a mile, he shook up his little Welshman and came past his lordship.

One other point worth noticing is the etiquette of the road. If you have room in your cart without using the back seat, it is considered very bad manners to pass any respectable man who may be walking without asking whether he will like to 'ride.' If he be your superior, even though not personally known, the offer should certainly be made. So much is this a matter of

course, that a man will frequently start to walk to some place eight or ten miles off on a market day, knowing that he is soon sure to be overtaken and driven both ways. The East Anglians are not as a rule remarkable for their readiness to entertain strangers; they still seem to think that the 'foreigner' is generally to be regarded with suspicion; but certainly on the road their politeness exceeds that of the inhabitants of what they term 'The Sheeres.'

THE MONTH:

SCIENCE AND ARTS.

ACCORDING to the *American Field*, the Black Forest wild-boars of Europe have found their way to America, and are breeding and thriving there. It seems that some few years ago Mr Otto Plock of New York imported into the country from Europe nine boars and sows, in order that they might destroy the snakes and other vermin on his estate near the Shawangunk Mountains, which border Orange and Sullivan counties. The animals soon made short work of the vermin, and then escaped to the recesses of the mountains, where they have multiplied considerably. It is said that the beasts are so ferocious that the boldest hunter thinks twice before coming to close quarters with them.

We noticed the other day in a crowded London thoroughfare that the passers-by were attracted by the novelty of a parish water-cart which was plentifully sprinkling a crimson rain over the thirsty stones. This fluid was of course water in which had been dissolved some permanganate of potash, one of our most useful disinfectants. The precaution of using such a mixture during the hot weather in crowded places is much to be commended, and might be imitated with advantage in other localities.

There were some curious observations made with regard to the fall of hailstones which occurred in this country in the beginning of June, and which affected a very wide area. The stones were of unusual size, weighing in some cases several ounces each. Some, again, appeared to be compound, as if two or more stones had become fused together; others, again, were made up of concentric layers like the coats of an onion. But the most curious observation was made by Mr I. C. Thompson, who records that he found in several a dark-coloured stony deposit. He also found small pieces of vegetable tissue which under the microscope had the appearance of cryptogamic spore cases.

A phenomenal bird was recently exhibited to the members of the Zoological Society of London. This was a female silver pheasant which displayed the plumage of the male bird, and which represents, we believe, quite a unique case.

In a Report presented to the American Society of Civil Engineers there is an account of some recent experiments by Mr J. B. Francis with reference to the percolation of water through

cement. One of these experiments showed that under a pressure of seventy-seven pounds per square inch, more than seventeen gallons of water per square foot of surface will pass through sixteen inches of cement in twenty-four hours. Other experiments showed that thick brickwork laid in cement permitted a copious percolation of water under pressure. The question is one of no little importance, especially in connection with drainage-works, where brickwork conduits are commonly used.

The Nebuliser is a spray apparatus which was designed by Dr Lighthill of Boston as a ready means for introducing any liquid remedy direct to the lungs and lower air-passages. This is accomplished by means of a containing vessel to which is attached an india-rubber bulb, upon squeezing which the liquid within the vessel is discharged from a tube. This tube is held in the mouth while the operation is going forward, and the finely divided liquid, in the form of spray, is drawn into the lungs. Any chosen remedy can be readily given in this manner, and the method has already been found effectual in many instances. The apparatus has recently been introduced commercially in this country.

A foreign medical journal has a note to the effect that Professor Renzi of Naples has treated successfully several cases of tetanus by insisting upon absolute rest for the patient. But this treatment does not mean the mere release from labour which is so valued by all hard workers. The patient must rest his several senses as well as his body. His ears are closed with wax, his room is dark, and its floor is heavily carpeted. Every fifteen minutes the nurse enters with a shaded lantern to attend to the patient's wants, and to administer food, such as eggs, beef-tea, and the like, which requires no mastication. Sedatives are given to relieve pain. It is not pretended that this novel mode of treatment shortens the period of this terrible disease, but it slowly acts in lessening the force of the paroxysms, which gradually cease altogether.

It has long been a source of vexation and disappointment to tourist photographers that their sensitive dry plates are liable to be examined at the Custom House, and that access of light to the plates during such examination renders them useless. It has happened before now that the pictures, as yet undeveloped, which have been taken by the tourist at great trouble and expense, have thus been utterly ruined during the journey home. But at last amateur photographers have become so numerous that they have the power to cause their grievances to be attended to. It was lucky for one of them lately that he had a friend in Lord Ribblesdale, who was able to bring this matter of exposure of plates by Custom House officials under the direct notice of the Government. It has now been authoritatively stated that such a vexatious episode is not likely to occur again. At most Custom Houses we shall now probably have dark rooms, where by red light, which does no harm to photographic plates or films, suspected packages can be examined by zealous officials.

A correspondent of the *Zoologist*, in the course of an interesting account of the wholesale destruc-

tion of small birds which takes place at various continental towns, gives some particulars of the manner in which wood-pigeons migrating south in the autumn through the passes of the Pyrenees are snared by the inhabitants of the various districts in which these mountain-gorges are situated. Across these narrow ways, nets are spread and attached to trees on either side; and on the top-most branches of one of these trees is stationed a boy with a stuffed hawk. As the pigeons approach, he pitches the hawk into the air, and the poor birds dive down out of the way of their supposed enemy, and are caught in the netting below. The same writer gives a long list of birds whose dead bodies he saw exposed for sale at a poulterer's shop at Rome. Among these victims were blackbirds, thrushes, linnets, goldfinches, robins, and many other little feathered songsters that we in Britain should be ashamed to look upon as edible.

We some time back called attention to the establishment of a Ladies' League, which had for its object the humane one of preventing the wholesale massacre of our feathered songsters in order that their bodies might adorn hats, bonnets, and other articles of female attire. It would seem that some such organisation were terribly needed among our French neighbours, for the destruction of small birds there is so enormous that the Zoological Society of that country has made a warning protest to the Government concerning the serious consequences which are likely to ensue. In one place on the coast, which is said to be the chief landing-place for swallows coming from Africa, wires have been extensively laid down. These wires are connected with electric generators, so that directly an unfortunate bird completes the circuit by touching them, it drops dead. We trust that this report is an exaggerated one. It is hardly likely that such a death-dealing arrangement would be extensively employed, for the reason that the expense of installation and maintenance of such a system even on a small scale would be considerable.

At the Society of Arts lately, Dr Salvati read a most interesting paper upon the Manufacture of Venetian Glass, in which he stated that that beautiful product is actually manufactured not in Venice proper, but at Murano, an island which lies half a mile north of that city. The paper was an exhaustive one, and spoke highly of the harmony which exists among the artists employed at the works, each striving to do his best to produce the most beautiful results. But there is one terrible circumstance in connection with this industry, and that is, that after many years of work, when these good people are between forty and fifty years of age, they begin to lose their sight, and after a short while are wholly blind. There seems to be no remedy for this unfortunate state of things, for many protective devices have been tried without success. The blindness is caused by the excessive heat and also by the glare of the never-ceasing flames from the glass furnaces. It is some comfort to know that these poor victims to art are content to live very simply, and as their wages are high, they are able to save large sums. Thus their declining years, although passed under such sad conditions, have not the additional misery which want entails.

It was stated some time ago that from experiments undertaken by two French savants they

had detected a certain principle in the exhalations from the human lung which exerted a powerful poisonous action; this poisonous property being quite apart from and in addition to the carbonic acid gas which is given off by all animals as a product of expiration. In some fresh experiments a number of rabbits were placed in a series of air-tight cages, so that, as pure air was caused to enter at one end of the series, the rabbit confined in each cage was compelled to breathe the same air until it was discharged at the last cage. Thus the animal in the first cage only was permitted to breathe absolutely pure air. It was found that under these conditions the rabbits placed in the further cages rapidly died. At the same time the experimenters record that animals of various kinds can breathe without inconvenience air containing a high percentage of uncontaminated carbonic acid, and notably is this the case with men, who can breathe for two or three hours air which contains as much as twenty per cent. of that gas. A further experiment was tried of passing the air from the sixth cage through sulphuric acid, by which action the poisonous principle was removed, but the carbonic acid remained. Under these conditions the animals in the last cages lived without inconvenience, whilst that in the sixth cage died after a short time. It seems certain, therefore, that the injurious effect of expired air is due to this poison, and not to the gas named.

We import into this country a vast quantity of Indian wheat, not less, indeed, than one million tons annually. With it we import no fewer than one hundred and fifty thousand tons of dirt. The Secretary of State for India, with a view of finding some remedy for this state of things, convened a short time ago a Conference upon the subject; and it is to be hoped that the labours of this Conference will result in some better way of preparing Indian wheat for export to this country.

According to Sir Spencer Wells, the practice of cremation is on the increase. In Rome the number of human bodies cremated had increased from one hundred and nineteen in 1886, and one hundred and fifty-five in 1887, to more than two hundred in the past year. At the Woking Crematorium, too, in our own country, the number of cremations has been sixty-nine since that method of disposing of the dead had been authorised by parliament. Sir Spencer Wells holds that it will be impossible to prevent the spread of a number of our most terrible diseases, including consumption, diphtheria, scarlet fever, and cholera, if burial in the earth of the bodies of those who fall victims to such maladies is continued, and that our cemeteries, in fact, by preserving the germs or seeds of such diseases, are nurseries for their perpetuation.

• According to the *Hospital*, there is a great deal of artificial honey at present offered for sale, and purchasers will perhaps be more careful in buying that sweet product which is supposed to come from the beehive, when they know that it is commonly made of potato starch and sulphuric acid. Some people may think that, by buying the honey in the comb, they will steer clear of such sophistication; but the same authority tells us that the beautiful white comb which looks so nice and genuine is often made of paraffin wax. We hope, for the credit of human nature, that

these statements are not founded upon actual fact.

A French scientific journal gives a recipe for a cement which is coming into use, and which is said to be harder and more enduring than any other known. It is made by mixing glycerine with litharge (oxide of lead). The preparation seems to be very simple: the finely powdered litharge, after being dried at a high temperature, has glycerine added to it until the mixture is of the necessary consistency, that of thick mortar. Another recipe for a cement for a different purpose, namely, for the attachment of paper labels to metal, has also been lately published. The metal is dipped into a strong solution of soda, and is afterwards washed over with the juice of an onion. Paper pasted to a surface so prepared will, it is said, stick with such tenacity that it is almost impossible to release it without destruction.

Most of us have gone through the disagreeable experience of taking a chair at some public park or other place to find afterwards that a fee has to be paid as rental for it. A new Automatic Seat, which requires no attendant to demand the aforesaid coin, has recently been on view in London, and is said to be already in extensive use at various places on the Continent. The chair has a spring seat, and that seat is held rigidly to the back, and cannot be pulled down to a sitting position until a penny is dropped into the slot at the side. The seat of the chair is then released, and the occupier is free to use it as long as he pleases. When he rises, he must place an umbrella or other article on the seat, to prevent it flying back again to its normal position, or he will have another penny to pay before he can again use it. The arrangement is an ingenious one, but still we feel that without any great sacrifice seats might be provided in public places free of charge.

For some time past a method of protecting the vines in various districts of France from the attack of mildew has been adopted. This consists in sprinkling the leaves of the vine with a mixture of sulphate of copper and slaked lime in water. The question arose—owing to several cases of sudden illness last year in persons who had drunk of the product from vines thus treated—whether the copper did not enter into the plants to such an extent as to make the wine from them poisonous. The British consul at Bordeaux, in alluding to this matter, informs us that careful analysis has proved conclusively that the vines so treated are not injurious to health; for although a certain amount of copper is absorbed by the plant, a person would have to drink at least two thousand gallons of wine produced from it before he could absorb into his system enough copper to do him any injury. The trifling amount of copper in the wine is much less than that contained in many other articles of daily consumption. Whether this treatment of the grape affects the flavour or other qualities of the wine produced from it, is a question which must for the present remain an open one.

Under the name of Dalura, a kind of artistic decoration in wood has just been brought to our notice, which will enable many who are fond of adorning their houses tastefully, but whose means are too limited to go to large outlay, to

indulge a little more freely in domestic adornment. Dalura is solid wood upon which, by the combined action of heat and pressure, designs in relief are produced which are simply delicious in their clearness and neatness of execution. The process by which these effects are obtained is very simple. It is carried out by means of a small machine, the principal working parts of which comprise a pair of horizontal steel rollers revolving slowly. The upper roller, which is heated by a gas-flame, carries around its circumference the pattern, the lower roller being smooth. The wood, which may be hard or soft and of any length, is passed between these rollers under pressure, and the special pattern which the upper roller may happen to carry is reproduced on it. The pattern, the result of compression, comes out in relief, which may be varied according to the style of the work. The result of the exceedingly simple operation is that the grain of the wood is retained, the background being toned from a deep to a pale brown, or left the natural colour of the wood, as desired. The depth of the colour is regulated by the heating of the upper roller and the rate at which the wood is made to travel between the rollers, the raised design standing out in the natural colour of the wood. The system may be applied to furniture and internal decoration in a variety of patterns, and both in the curved and straight form. As the Dalura decoration is stated to be waterproof, it may equally be used for outdoor decoration.

Some curious machines, constructed on the principle of 'Put a penny in the slot and the figure will work,' have just been placed at some of the London railway stations. Their arrangement is ingenious, if somewhat complicated, and they are designed to receive and deliver messages. Hence, they have been called Message Cabinets. The mode of operating them is as follows: The apparatus is in the form of a cabinet, the lower portion of which is desk-shaped. In this portion two apertures, one large and the other small, are cut, through which paper for writing messages appears. The upper portion of the Cabinet is a glazed frame, behind which the written messages are made to appear, but hidden from view by sliding-doors. In order to write a message, a penny is placed in the slot in the desk-portion of the Cabinet, by which a small locked handle below it is released. The latter is then pulled, when paper on a continuous roll appears under the two apertures, in the larger of which the message is written, while the paper in the smaller aperture is sufficient for a name, initials, or an agreed sign. The handle is then turned back, when the message recedes from view, the paper being carried upwards to the glazed portion of the Cabinet. The names of the intended recipients always remain in view, however, so that a person expecting to find a message glances down the list for his name or initials. If he finds it there, he places a penny in the slot in the upper compartment, by which a locked handle close to the slot is released. The handle being turned, the door automatically slides back, and the message may be read. On the handle being let go, the door slides back into its former place, and cannot be re-opened unless a fresh penny is put into the slot. The machines seem to be taking well, especially among the curious, for it has been found that the number of

pennies in the delivery slots far exceeds the coins placed in the receiving slots.

'Grains' are a by-product of brewing, and enter largely in the dietary of stock-farms where they can be conveniently obtained. But grains must be fresh from the breweries, because they spoil by being kept too long. To obviate this, Herr Emil Passburg, of Breslau, has applied the principle of evaporation *in vacuo* to the extraction of moisture from solid substances, and has been successful in constructing an apparatus for drying grains. In this instance the process appears to be of special advantage, as brewers' grains contain as much as seventy-five per cent. of moisture, the carriage of which has to be paid for, if they are sent out wet. The retention of water in the grains also acts prejudicially upon them, and if they are not used quickly, they perish. Herr Passburg, at the recent meeting in London of the Institution of Mechanical Engineers, described his apparatus. Two of these machines are at present in operation at Messrs Guinness and Sons' Brewery, Dublin, and they are reported to give every satisfaction in their working and the economical results obtained, the cost of drying grains being about six shillings per ton, the apparatus being worked from the boilers and machinery of the brewery.

INDIAN LIFE IN THE FAR WEST.

THE Indian braves, or bucks as they are called on the frontier, consider it beneath their dignity to take any active part in the distribution of rations at the several agencies in the Far West of the United States, except at such times as live cattle are distributed for beef; then they appear mounted and armed, anxious to exhibit their ability as horsemen and marksmen. These times are the only chances they now have to enact again the scenes of the buffalo hunt, and glad are they to take advantage of the opportunity.

On such an occasion, the cattle corral, usually situated a few miles from the agency buildings, presents a picture both novel and interesting. Inside are the cattle to be given out, one head to so many families of Indians; and these animals being nearly as wild as the buffalo, add to the interest. Assembled around the outside of the corral you will find the Indians attended by the squaws, to whose lot falls the works of skinning and dressing the cattle after they have been killed by the braves, who believe that any kind of manual labour is beneath them. While awaiting the arrival of the agent, whose duty it is to deliver the animals, and see that they are properly distributed, these children of the plains amuse themselves with horsereading and exhibiting their skill in horsemanship; or they sit around on the grass smoking, while the squaws hold their horses in readiness for them to mount as soon as the time arrives. In smoking, the Indian exhibits a peculiarity which to a white man would be very distasteful: the pipes are passed from hand to hand around the circle, each man taking a few whiffs, and passing the pipe to his nearest right-

hand neighbour. You cannot offer an Indian a greater insult than to refuse to smoke from his pipe when he offers it.

But the approach of the agent is the signal for general activity : the horses are mounted, and the Indians assemble near the gate of the corral, from which the cattle are driven out one at a time. As soon as the poor animals find themselves free, they naturally start on a run for their feeding-grounds. Then the sport commences, for as each animal is let out, it is followed by a number of yelling Indians, as fast as their ponies can run, shooting arrows into its sides until it either receives a mortal wound, or drops from loss of blood and exhaustion. Sometimes the chase is made doubly exciting and interesting by the pursued turning on its pursuers, when it will fight with as much courage and ferocity as any beast of prey, often goading the ponies, and trampling and 'hooking' the Indians. As soon as the animal drops dead, the squaws gather round it, skin and dress the carcase, and fight like a lot of buzzards over the entrails, which are considered a delicacy by them. But the greatest delicacy you can give an Indian is a fat dog, which he will eat with much relish. At their principal feasts, this is considered the most delicate dish.

The redskins continue to practise many of the customs prevalent before their civilisation was attempted, especially their dances, chief among which is the Sun Dance. This is really one of their religious ceremonies, and is observed by the Sioux nation every year, usually during the month of June, when the Indians form a temporary camp and assemble in large numbers, several thousands often being present. This is the most important period in the lives of the young men of the tribe, being the ordeal through which each has to pass to prove his bravery and to satisfy the older men that he is entitled to be counted among the braves. This ceremony controls the future life of a young Indian ; at this time he may be said to step at one stride from boyhood to manhood. The Sun Dance is the last relic of barbarous days ; and notwithstanding the efforts made to civilise the red men, they cling to its observance with a persistency which proves how difficult is the task the advocates of Indian civilisation have undertaken.

About ten days are usually occupied in the ceremonies attending the Sun Dance, during which time the chief medicine-man of the tribe holds despotic sway. From the maidens of the tribe, one (a virgin) is selected to cut the pole around which the dance is to take place. After the pole is cut and the medicine-man has consecrated it and invoked the aid of the Great Spirit to sustain the young men in the ordeal they are about to go through, thongs of raw hide are attached to the top, and it is set in its place by the same maiden.

In the medicine-man's tent the young men, who have already fasted for several days, submit to have the flesh on their chests cut in two gashes about half an inch apart, an inch or two in length, and loosened from the bones. Then they march to the pole, and each in turn has the loose end of a raw-hide thong pulled through the slit and fastened securely. They are then compelled to dance around the pole, to the music of the drums

and tom-toms, straining and pulling back in the endeavour to tear themselves loose. If they succeed, they are declared braves, and worthy to go into battle. In order to show that they are entitled to a special work of distinction, they dance afterwards in a circle, and cut their flesh with sharp knives until they are compelled to desist from loss of blood and weakness.

The other dances customary with the Indians, accompanied by the drums and tom-toms, are then indulged in by the older braves, who vary the monotony of the dance by each in turn stepping into the magic circle, and, with great flourish and egotism, recounting his own deeds of valour and the number of scalps taken by him. After this, a grand dog-feast is prepared by the squaws, and partaken of by the braves with much relish and gusto, where the participants gorge themselves, and sleep off the effects like a lot of overfed hogs in a pen.

THE OLD, OLD STORY.

HAVE you forgotten the old, old story

You whispered to me on that golden day

When the sun was flooding the earth with glory,

And hedges were fragrant and white with may ?

Our path led over the cowslip-meadow,

Where birds sang gaily from every tree,

And the way was flecked with sunshine and shadow ;

But only the sunshine fell on me.

With the lads and lasses to go a-maying,

That morn we had left for a space life's toil ;

And we heard the sound of their footsteps straying

Where the hawthorn promised abundant spoil.

Their hearts grew glad in the golden weather ;

They gathered the flowers beneath their feet ;

But we two loitered behind together,

For the old, old story seemed new and sweet.

'Tis May-time again ; and youth and maiden

Hasten away to the country road,

To cut down the boughs that are blossom-laden,

Or help to carry the fragrant load.

The sunshine is flooding the earth with glory ;

The birds are singing on every tree ;

But you have forgotten that old, old story,

And only the shadows fall on me.

E. MATHESON.

* * TO CONTRIBUTORS.

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. To secure their safe return if illegible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

THE HARVEST MOON.

WHETHER as a thin thread of light, tracing her pale curved outline against the clear sunset sky, or as a broad effulgent disc, making midnight brilliant over the frosted plain, or leaving a lane of light across the waves, reaching from our feet beyond our sight, the moon lends beauty and brightness to our world's scenery. She has in all ages been the changeful favourite of poets and lovers, a fact perhaps accounted for by the variety of her appearances, aided by the gentleness and purity of her light. Milton in *Il Penseroso* desires to

Walk unseen

On the dry smooth shaven green,

To behold the wandering moon

Riding near her highest noon,

Like one that had been led astray

Through the heaven's wide pathless way.

But while the great poet is true to nature in his fancy, he would well know that while the moon might *seem* to be led astray, she never was so. He knew that the stars

Each had his place appointed, each his course.

Yet in Milton's day little was known as to the real nature of these courses, compared with the clear and orderly teaching of our modern astronomy. Especially is this true with regard to the moon, whose motions are now regularly predicted for five years in advance, and the causes of her changeful appearances well understood. Most people indeed know this vaguely, but very few so definitely as to be able to explain such an appearance, for example, as the harvest moon. Not very long ago we read in the 'Answers to Correspondents' of a generally very well-informed paper that there is a moon in March as bright and lasting as that which usually illumines the September evenings, but that nobody notices it then, as it is of no special use to mankind! I think any one who, like a friend of the writer, sprained his ankle during the intense darkness of the moonless evenings of last March, would

answer differently! This answer is as far from the truth as it could well be. The full moon in March, instead of remaining with us evening after evening, disappears with great rapidity. In fact, any person who observes will find that March is as conspicuous for the brevity of moonlight as September is for its duration.

Most people who live in the country will have noticed, too, how the full moon in midwinter rides high overhead, while in midsummer it rolls low across the southern sky. Some of our readers may indeed have asked in vain an explanation of these changes, while most will probably be interested to have one, and to compare it with their own observation of the phenomena. To explain all the lunar changes would of course occupy too much space, and we shall select for our purpose the so-called 'Harvest Moon,' as that is again coming round in due season, and also as it seems to be one of the least generally understood.

This appearance is not due to any lengthening of the time during which the moon is full, and still less to any enlargement of the lunar disc. The diameter of the apparent disc may be as great, or a little greater, and the moon remain what we popularly call 'full' for even a longer time, in winter, spring, or summer, and yet no effect such as we see in September be produced.

The moon in September has this peculiarity, however, that it rises for a good many successive evenings about the same time, say between six and nine o'clock in the evening, and continues to give light all night. This enables harvest-work to go on continuously, night and day, and is found to be a most beneficial arrangement. For example, the moon, if full, say, on the 9th of September (as it is this year), will rise, for more than a week about that date, somewhere between 6.30 and 9.10 P.M. Its time of rising will be later each night by only some twenty minutes, and it will give light the whole night through. This will give a full week during which there will be very little darkness at all. Whereas, if we take the spring moon of 1888, full on the 27th of March, we shall find that it rose then nearly one

hour and a half later each evening, and in five days after full moon, instead of rising soon after eight o'clock, it did not rise till half-past eleven. These, too, are not specially chosen cases; more striking ones could easily be found.

Now, when we ask the reason for this beneficent behaviour of the moon at harvest-time, we are met with a most interesting fact at the outset—namely, that the cause of the harvest moon is the same as the cause of the harvest itself. Both depend on the position of the sun in the sky. As the great light of our world withdraws himself southward, and the short days come on, the harvest, stimulated by his summer beams, whitens for the sickle. And this very declining motion brings the full moon into the position in which she gives light to the wagoner and the reaper.

A little consideration will enable us to see how this is the case. The position of the sun in the sky at the time of full moon determines the place then held by the moon, which at that time must be directly opposite the sun, and like

His mirror, with full face borrowing her light
From him.

Thus, if the sun be high overhead, the full moon will be below the horizon, enlightening our antipodes. If the sun be setting nearly due west, the full moon will be rising nearly due east; and if the sun be setting in the south-west, the full moon will be well risen in the north-east. Now, we can easily follow the theory of the harvest moon if we grasp this elementary truth, that sun and full moon are thus always in opposite regions of the sky, so that if at time of full moon we turn the back of our head to the sun and look straight before us, we shall look right to where the moon is, whether it be below or above the horizon.

But as the midwinter and midsummer positions of the full moon are more simply explained, we may apply this principle to them first, so that our readers may be prepared more easily to understand the more complex case of the moon in autumn.

First, then, take the full moon in December. It then rides high in the heavens, and comes further north at rising and setting than at any other time of year. Our principle demands that this should be because it is opposite to the sun at that time, and of course this is at once evident, for the sun is then farther south than at any other time. The full moon, then, must come farther north, which is the case.

Again, in June the sun is farther north than in any other month of the year. His rising and setting are beautifully seen from windows which have even a direct northerly aspect. Our principle demands that the full moon should then be far south at its rising and setting, which again we find to be the case.

Now, the farther north in the sky the full moon is, the earlier in the evening it will rise; just as the sun rises earlier in the morning the farther

north it comes, until at the farthest north point of its course it rises in summer before four o'clock. Hence the full moon in December, being far north, rises early, and lights the whole of the long winter night. Every one must have noticed the exceeding beauty of a frosty moonlight night at this season, especially if snow be on the ground. The dark night is transformed with a fairy-like brightness. The trees stand decorated with millions of gems, and the traveller can discern his way nearly as well as by day.

Again, in summer the sun being far north, the full moon is far south, and rises late in the evening, though early enough to illumine the short summer night. In fact, both sun and moon reverse the old proverb, 'Early to bed and early to rise,' for if they rise early at any time, they go to bed late, and *vice versa*!

These two cases of summer and winter show us what happens when the full moon is farthest to the south or to the north in the sky. Now, in March and September she occupies, as we shall see, a position midway between her northern place and her southern, these two months of course being each like a half-way house between summer and winter. In fact, sun and full moon in their yearly changes are like two men walking round a circular track, obliged always to keep exactly opposite each other. The resemblance is closer, for our purpose, if we imagine four little houses to be erected round such a track, each towards one of the cardinal points. When man No. 1 is in the southern house, No. 2 must be in the north one; and when No. 1 is in the western house, No. 2 must be in the eastern. In June the sun is in his north house, and the full moon has to be in the south one. In December the opposite holds true. In March and September they are each in one of the half-way houses to the east and west.

And we see here what misled the author of the answer to which we referred before. He evidently thought that when the full moon was in any of these half-way houses, the same phenomena would occur. But he had failed to take account of a cardinal point in the matter—namely, the *direction in which she approaches and leaves the house*. And it is this *direction* which causes the harvest moon. Hence, we would ask our readers' careful attention to it. We will suppose our men to start, one from the north house, and the other from the south. Let No. 1, leaving the north, walk towards the west house first. If No. 2 is to keep opposite him, he must take his way to the east house, where he should arrive when No. 1 is entering the west one. But No. 1 will be travelling then southwards, and No. 2 towards the north. This is, in fact, what happens with sun and moon on the evening of full moon in September. The sun is nearly due west at his setting, and the full moon nearly due east at its rising. The sun is going southwards to his winter position, and the moon is rapidly going northwards.

Now, we have already seen that *going northwards* in the sky means *rising earlier in the evening*. Hence, about the time of full moon in

September, the moon has a strong tendency to rise earlier rather than later each evening. But its *natural* tendency, with which we are all more or less acquainted, is to rise *later* each evening by about an hour on the average. What we might call the *artificial* tendency, due to its northward motion in September, is not sufficient entirely to counteract this, but it does reduce it from its average of an hour or so, to about twenty minutes, and that for more than a week, about the time of ingathering of corn in this country. But, observe, this all depends on the fact that the moon is then moving north, night after night, for that time.

Now, we are prepared at once to understand why there is not a similar display in the month of March. The sun is then coming into his western house, travelling *northwards*, and the full moon passes her eastern one, of course going in the opposite direction, or *southwards*. Hence, as going northwards means rising earlier in the evening, going southwards means rising later. The full moon in March, therefore, has an artificial tendency to rise *later* every night, and this, added to her natural tendency always to do the same, makes her rise an hour and twenty minutes or so later each evening at that season. In fact, the artificial tendency due to her change of place north or south in the sky in September is *subtracted* from her natural tendency to rise later, and is *added* to it in March. Hence she lingers with us in the former month, and hastens rapidly away in the latter.

And in this we have a curious instance of the subtle interweaving of influences with which we are surrounded, and a suggestion of something on a higher plane than that of mere addition or subtraction. In March, the moon hastens to hide her feeble beams before the advancing night of approaching summer; and in autumn, she seems to linger to console man for the quick oncoming of the wintry darkness.

We might only add, for the information of any one desiring to pursue the problem further, that there is a likeness between the moons of March and September, only it is the *new* moon in March which behaves as the *full* one does in September, and of course that thin crescent does little to illumine our darkness.

JOHN VALE'S GUARDIAN.

By DAVID CHRISTIE MURRAY,

Author of 'VAL STRANGE,' 'JOSEPH'S COAT,'
'RAINBOW GOLD,' etc.

CHAPTER XXXII.

'MERRY Christmas, sir,' said the man who brought in Snelling's shaving water. The occupant of the bed grunted an answer which by its sound had little merriment or cordiality in it; but the man who waited on him was either in a resolute Christmas humour or did not notice Snelling's tone. 'Lovely morning, sir, real reg'lar downright old-fashioned Christmas, sir. Snow six inches deep, sir, everywhere; and the wind that cold, sir, it cuts you like a razor.'

'What's there to be merry about in that?' growled Snelling.

'Don't know, sir,' the man returned. 'Christmas

weather, sir. It's the fashion to be cold at Christmas, sir; and a man might as well be out of the world as out of the fashion.'

'Very well,' said Snelling. 'You needn't wait; I don't want you chattering here.'

The man retired, so far unabashed that Snelling heard him whistling in the corridor outside.

'What's Christmas to him, the fool?' he thought. 'What's it likely to be to me?'

He was not the man he had used to be. He had found out his nerves, and that is a woful discovery for any man to make. He slept ill, and had dreams which he could not remember, but which he knew were horrible. The sense of them clung to him in his waking hours and irritated and depressed him. He began to find himself liable to many fits of anger when things went wrong, and he knew very well that his chill rustic dignity of a year back would have served his turn better with the world.

He dressed and went down-stairs to a lonely breakfast in the coffee-room. A keen north-easterly wind was blowing, and the chimney smoked. At the first mouthful of breakfast he took, his teeth grated on a morsel of burnt coal which had fallen into the dish. He rang the bell angrily and rated the waiter; but the exercise afforded him little relief, if any. Other people were looking forward to a day of pleasure. He was looking forward to a day altogether blank and purposeless, a lonely and unsocial time beguiled by no occupation. The feeling of other people's contentment and happiness emphasised his solitude, and he felt bitter with the whole world. The landlord came in whilst he was marmalading gloomily up and down the room.

'You'll be going out to dinner, of course, Mr Snelling?'

'Who?' said Snelling. 'Me? No.'

'Not going out to dinner on Christmas day, sir?' said the landlord.

'I suppose,' his guest returned, straightening himself, 'that a man may dine where he pleases.'

'Oh, certainly, sir—certainly, sir! To be sure, Mr Snelling—to be sure. But unluckily, sir, I've given the cook a holiday, and she's gone already.'

'That's very pretty management,' Snelling answered angrily. 'So a man's to go without his dinner because it's Christmas day?'

'I never thought, sir,' said the landlord.

'Then you ought to have thought,' said the outraged customer. 'You ought to ha' come to me and be taught what to think. You've got a man staying in your house, and you send your cook away without asking by your leave or with your leave! You must give me leave to tell you, sir, you don't know how to keep a house of entertainment.'

'Really, Mr Snelling,' said the landlord, 'I never supposed'—

'That's what I'm telling you,' returned Snelling. 'You don't seem to have the sense to suppose.'

'I'm very sorry, sir,' returned the landlord. 'But if it comes to that, I've kept this house for thirty years without any help from Mr Snelling, and I shall look respectfully forward to keeping a roof over my head without his help in future.'

'Enough said,' Snelling answered. 'I shall quit the house when it suits my pleasure. We need say no more.'

He and the landlord, who had been neighbours since his boyhood and excellent friends hitherto, parted with bad blood between them. He was in a mood less like Christmas than ever, and last Saturday's newspaper, blotted, limp, and tattered, made him but an indifferent companion. When all's said and done, he had a superstitious reverence for the social superstitions of the day. It was a day on which to eat and drink and be merry, and not a day on which to mope alone and to live on the cold scraps of the larder. Christmas had never been particularly merry to him personally, so far as he could remember, for he was not a merry-making man; but he had a rooted respect for the social tradition, and Christmas without its roast sirloin, its turkey and sausages, and its plumpudding, was a mere monstrosity of time. The very paupers had their beef and plumpudding, and made their hearts merry on that one day of the year.

In an hour or two the landlord put in a second appearance. He was attired by this time in his best clothes, and was evidently ready to pay his Christmas visit. 'I hope there's no ill-will betwixt us, Mr Snelling,' he said. 'There's none o' my side. It was natural in you to be a bit angry, and I suppose it was natural in me to tek offence at it. I'd wish you a merry Christmas with all my heart, if it looked like much chance of your having one.'

'Theer, theer!' returned Snelling with half a sigh; 'let's say no more about it. You'd have asked if you'd ha' thought about it. It's not your business, nor yet your way, to be disobliging. I was a bit too peppery, I daresay.'

'Come!' said the landlord, 'that's comfortable. I've got a drop o' brown sherry in the private bar, the like of which you don't see often. Just a glass now, Mister Snelling. It's Christmas morning, and that's what you can't say every day in the year.'

Snelling assented; and he and the plump landlord and the meagre landlady drank a glass of wine together and wished each other a merry Christmas. He had never felt so lonely in his life, and he could have clung to the landlord for company's sake. The pair drove away in their dogcart, and he waved them from the door. Then the one servant remaining in the house locked the place up and retired to her own quarters. The silence of the house was oppressive, and the loneliness and monotony of the minutes grew to seem scarcely endurable. The fear lest he should incense Shorthouse by his absence, and through him, should offend Cecilia, had always been present to his mind, but never so strongly as now. His lonely misery pushed him towards company, and was strong enough to have made the worse appear the better reason. If, as he more than three-fourths suspected, Jousserau was his rival, he himself was doing a foolish thing in staying away, and in giving his enemy a chance to put as dark a complexion as he could upon his character. On a sudden it seemed an act of madness to stay away. The one chance he had of a reconciliation with Cecilia lay in this Christmas dinner. If Jousserau's rivalry were real, and not a mere creation of his fancy, his one course was to let her see the two pretenders to her hand together and judge between them. He was very far from being afraid of comparison, for he

was simply powerless to judge of the faculties and charms which were on the artist's side.

'The wench'll want to marry a man, I reckon,' he thought, as he surveyed the reflection of his own stalwart shoulders. 'I could break that little chap across my knee. What's she likely to see in a fellow like him, a little black-avised chap the colour of a piece of coal? She'll want to marry a white man if she marries at all. If it got into her head as I was afraid to face him because of what he said about me—why, I've been no less than a fool to think of shunning him. The only way's to face her, and never to give her a minute alone with him if I can help it. I'll put Shorthouse up to it too. He's not the man to let his daughter marry a foreigner.'

Animated by this new resolve, he rang the bell, and the lonely servant answered from her distant quarters. 'I'm going out, young woman,' he said, addressing her, 'and I mayn't be home till midnight. See there's somebody left to sit up for me.'

The girl promised, and retired; and he went up to his own room to dress. He attired himself with scrupulous exactness. The fire had destroyed his wardrobe, and he had been obliged to provide himself with a complete outfit, so that everything he owned was brand-new. Since he took rather an unusual pride in his person for a man of his social position, the things were of the best. When he was fully attired, he surveyed himself with complete approval; and then summoning the girl anew, ordered her to undo the fastenings of the door, and so passed into the street. A four-mile walk in bright winter weather would make by no means a bad preparation for dinner. The six inches of snow upon the ground made little difference to him; but for comfort's sake, he carried a change of shoes neatly done up in brown paper under his arm.

He found, like most men, that bodily motion in the open air lent a brighter colour to his thoughts; and as he walked, his courage rose so fast that, by the time he had reached the old church in the vale and had so got fairly into the country, he felt like a man foredoomed to conquer. In his lower moods these fluctuations disturbed him, and he recognised his own changeableness of temper with great misgiving. But when the pleasanter hour recurred, it fed and warmed him like meat and fire, and he was always persuaded that the change was permanent.

He reached the house, and found that he had only just arrived in time. Jousserau was there already, and so also were Isaiah and Mrs Winter, who had brought young John with them. There also was a Beacon-Hargate lover with his lass, a young lady from Heydon Hey, an old school-fellow of Cecilia's, who obviously triumphed in her engagement, and audibly instructed her *fiance* in table matters.

'George, pour out your wine into the little glass, not the big one.—George, don't leave your napkin folled on the table.—George, don't eat with your knife; I do declare you make me shudder.' By these and similar exhortations, the young lady from Heydon Hey made the dinner-hour a time of joy, and indisputably

established her superiority of breeding over the young gentleman from Beacon-Hargate.

Cecilia sat at one end of the table, and the farmer at the other, and Snelling was rejoiced to find himself placed on the girl's right. Jousserau sat by the farmer at the other end, in a position where he could not even exchange a glance with her. The yeoman addressed most of his conversation to his fair neighbour; and his alternate drawl and snap sounded pretty constantly, as he regaled her with a disquisition on the breeding of beef, a subject which arose naturally from the presence of the roast sirloin.

'Their's nothing like the rough Scotch for flavour, when they're in prime order and have been rested and well fed. A man 'ud no more think of buying 'em as milch-kine than he'd think of marrying an ugly old woman for love.' This was Mr Snelling's notion of gallantry, a genial mixture of implied compliment with solid converse. 'Mixed with the South Devon, I've known 'em do pretty well in that way even; but as for milk, for yield and quality, there's nothing like the Hereford.'

Jousserau talked with even less fluency than Snelling; but Cecilia thought that if he had been seated near her, he might have chosen other and more attractive themes. It is hard to be an unfavourable rival. The poor creature can do nothing right. The stupidest *banalities* of the chosen one will shine brighter than his most brilliant repartee, and if he happen to be the dull man of the two, the lady's conception of him is indeed mournful. Snelling flowed on unconscious so long as the dinner lasted, and conceived himself to be immensely entertaining and polite.

When at last the meal was over—and a Christmas dinner in that part of the world is not a thing to be hurried or to be treated lightly—the gentlemen sat down to a bottle of port, and the ladies retired to the best parlour for tea. The whole meal was strange to Jousserau, and he remarked it and its incidents with a humorous interest. It was about his ordinary hour for breakfast; and the appetites displayed by Isaiah, Snelling, and the farmer, and even by the young man from Beacon-Hargate, astonished him. The young man from Beacon-Hargate was at a disadvantage by reason of the watchfulness of the young lady from Heydon Hey; but he was a trencherman of no mean quality, and gained Shorthouse's cordial good-will by his strict attention to the business of the moment.

The little artist drank his single glass of wine, and found himself reproached by his host. 'The bottle's with you, Mr Jousseron,' said Shorthouse. 'Fill up and pass it on. Niver keep your neighbour thirsty of a Christmas day, of all days in the year.'

'Thank you,' said Jousserau. 'I have drink enough. I do never drink of a morning. I have not your English head.'—Snelling sat warm, full-fed, and self-satisfied, and complacently despised him.—'If you make no objection, I will join the ladies and take with them a cup of tea.'

'Let him go,' cried Snelling. A fellow who could hardly put two words together, who shirked his bottle after the first glass at a Christmas

dinner, and stood five feet four in his stockings, was a creature a true-born Briton might safely despise.

'Oh, come!' said Shorthouse; 'we must mek a better Englishman o' you than that. That ain't how you keep Christmas in your own country.'

'We do not much keep the Christmas in our country,' Jousserau answered; and the four who heard this statement fell back in their chairs and stared at him. Here, indeed, was a heathen state of things, an utter barbarism, the like of which they had never dreamed of.

With few further excuses, the foreigner was permitted to withdraw. The better instructed Britons remained behind, and got solemnly and stupidly bemused on the heavy and ripe old port which was the pride of Shorthouse's heart, and had been in his cellar when his father died. By-and-by they were aware of music in the adjoining room, to which the women-folk and Jousserau had withdrawn. This made them all the more comfortable and contented with themselves, for they knew that if they had been in the chamber where the music was going on, they would have been expected to sit mumchance and to look solemn. They looked solemn, and sat for the most part silent now; but then there is all the difference in the world between doing a thing because it comes natural at the moment and doing it in obedience to an ordinance you despise. Not one of the quartette knew anything about music, or cared more than he knew. The heady old port, the after-dinner lethargy, the warm fire, and the angles of the chairs into which they had fitted themselves, were all inviting.

When Jousserau entered the best parlour, he found Mrs Isaiah holding forth on the ailments incidental to early infancy, for the benefit of the young lady from Heydon Hey. Cecilia was seated by the fireside, rather languidly turning over the pages of a book. Her piano stood open near where she sat, and M. Jousserau, scheming to be near her, made a pretence of that fact, and strolling over to the instrument, turned over the pages of a volume of music which stood upon it. 'Oh, you have French songs,' he said suddenly turning to her. 'Do you speak, then, French?'

'Oh no,' she answered. 'There are English translations to all of them.' She turned round in her chair and read aloud the first line at which he had opened the volume: 'It was Dunoy, the young and brave.'

'A thousand excuses,' said Jousserau. 'Dunois. I beg your pardon. Perhaps it is Dunoy in English.'

'No, no,' said Cecilia; 'I am sure it is not. There is no such name in English. I am really obliged to you for telling me. I should like to be able to sing the French. We were supposed to learn at school; but I have forgotten, if ever I knew anything.'

'If I could have the pleasure to give you lessons,' said Jousserau eagerly.

The girl blushed, and at that the little artist blushed and began to flutter curiously. If he had kept his own old free-and-easy ways, he would have spoken his mind long ago, for in that respect he had been as quick in action as Denys of Burgundy himself. But there was a nimbus about this particular maiden, a sacred protecting light which half frightened him.

'You sing?' she asked, to cover her own confusion. 'Will you sing that for me, Monsieur Jousserau, and show me what the accent should be like?'

'I will try,' he answered modestly. 'But you must not laugh at me; I sing a little for my own amusement.' He took his seat at the piano, and struck out boldly the opening chords of *En partant pour la Syrie*. He had a mellow and powerful voice, fairly cultivated, and he sang, as might have been expected of him, with spirit and feeling. When he came to the last lines of the first verse, Cecilia was sure that one half the soldier's petition was already granted to him, and Jousserau was quite certain that he had the other:

That I might be the bravest knight,
And love the fairest fair.

Cecilia, though not yet aware of the character of her own sentiments, admired the little man beyond description. It goes without saying that she had never seen anybody like him; and in affairs of the heart, novelty goes for much. It counts for more when all the novelties are admirable, and Jousserau was not merely an astonishing artist, and vouched for by the vicar and his own manner as a gentleman, but he was alive from head to heel, unlike the bovine men she had lived amongst from her childhood, who knew neither how to feel nor express an unselfish interest in anything. The girl had never seen anything like his quick southern smile; nor anything, again, like his deferential and courteous manner; nor anything, again, like his generous, unpretending absence of any assumption of superiority over the rougher and less cultured people with whom he chose to mingle.

When Snelling and his *convives* came in at last, Jousserau was telling stories of his native Arles, and putting so much quaintness, verisimilitude, and fun into them that the two girls and the elder woman were brimming over with laughter.

'We've got nothing to thank you for, Isaiiah,' said Mrs Winter; 'but if it hadn't been for Mr Jousserong we might have been as dull as ditch-water. I will say this for Mr Jousserong,' she added, still laughing with both hands spread out upon her knees, 'he's the best good company I ever met.'

The phrase stung Snelling, and left a dull, slow, burning pain of jealousy. Cecilia, like the others, was beaming with good-humour, and he thought with a pang that she had never looked so in his presence, and that he had no power to move her in that way. Very good, then; let a solid man show his own particular qualities. This foolish froth of fun, over which two silly young women, and one silly old one, were cackling with enjoyment was not the only thing in the world. The solid man did his best, and talked parish politics in that bassoon-like drawl of his, with its rise and snap in the middle of every sentence. Everybody listened perforce, but nobody laughed. He had killed the innocent and harmless gaiety, and Cecilia looked bored and weary. She went back to her book again, and began to turn its leaves over as listlessly as before. The orator resented her want of interest angrily; but he had neither the will nor the means to show his disapproval. The girl had been happy whilst she

talked with Jousserau. Was it possible that, after all, breadth of limb, length of purse, and solidity of character were not the only things to woo a woman to a marrying mind?

CHARTREUSE.

WHEN the republican government in France suppressed so many of the religious Orders, an exception was made in favour of the Carthusians of the Grande Chartreuse; and much occasion for satirical remark did this exception provoke, because the reason for the exception was so manifest—that the French were unwilling to drive a flourishing manufacture out of France into Switzerland, whither, or to Tyrol, the Carthusians would have migrated at once, carrying with them their secret, had the republican government resolved to extinguish them. But this was not the sole reason of the exception made in their favour: the Carthusians of the Grande Chartreuse pay to the state annually a duty of six hundred thousand francs for alcohol; and if the Carthusians were abolished, the state would accordingly be six hundred thousand francs the poorer annually, and Austria or Switzerland so much the richer. But that was not all. Another consideration was, that the expulsion of the Carthusians and the transference of their business elsewhere would most assuredly have fanned disturbances in the Department of Isère.

The manufacture of the famous liqueur Chartreuse is a benefit to the entire Department, as the inhabitants are well aware, and relieves them from onerous rates. For the Carthusians who manufacture it are the members of a strict Order, one of the very strictest, and they do not want money for themselves; they live the most solitary and abstemious of lives, indulge in no splendour, not even of ecclesiastical buildings; and all the profits made by the sale of the liqueur, the secret of whose manufacture they alone possess, goes for the general good. It is said that the profits obtained from the sale of the liqueur amount to the annual sum of one hundred thousand pounds sterling—a princely income; but the Carthusians make a princely use of it. Almost all of the income is spent in the relief of the poor and in works of general utility. There is hardly a hospital or asylum of any sort in Dauphiné for sick, for insane, for orphans, that has not either been wholly founded or supported more or less by the Carthusians of the Grande Chartreuse. But this does not exhaust their munificence: they build bridges, contribute towards the construction of new roads, of schools and churches. They pay towards the conveyance of water by pipes and aqueducts to the towns from the pure mountain-springs. Further, hardly a tradesman who gets into difficulties in Grenoble and other towns and villages of the Department but appeals to the abbot of the Grande Chartreuse for help; and the abbot, after careful examination, and after having satisfied himself as to the honesty and respectability of the man in trouble, will lend him the money necessary to avert ruin without demanding interest on the sum. It is said—but such cases cannot be proved—that the Carthusians have come to the assistance of certain officials who had

not dealt over-scrupulously with public money in their trust, and have saved their reputations, and given them opportunities of recovering themselves.

Recently, not a little uneasiness reigned in the Department, for it was rumoured that the house of Rothschild had offered to buy the manufacture and the receipt of the General of the Order for the sum of eighty millions of francs. We can understand that this offer was a tempting one, if it had been made; for the manufacture of the liqueur had greatly extended, and was extending annually, to the disturbance of the object for which the Order was constituted. That Order was established by St Bruno to be no other than a collection of hermits. The Carthusians are not like ordinary friars and monks; they do not meet in hall for common meals. Each hermit has his own cell and garden, or yard, a little workshop, and a sleeping apartment. His food is handed in to him through a trap-door in the wall, so constructed that neither he who serves nor he who receives the food can see each other. Each monk is required to exercise some trade or profession, as idleness is strictly contrary to rule. The monks live on the simplest diet; and meet each other only in church for united offices, with one exception. That one exception is a peculiarity of the Order. Every Saturday the gates of the monastery are thrown open, and the monks have perfect liberty for a couple of hours to make excursions and take walks together—solitary if they like, or in twos and threes, just as pleases them, and talk as much as they like.

Now, with men under such a rule and adhering to it with the utmost strictness, the growth of the great business of Chartreuse-making must be somewhat of an encumbrance, and the temptation must be great to be rid of it. The belief, very prevalent in the Department, is, that the house of Rothschild desire, having effected the purchase, to turn the manufacture into a Joint-stock Company. This prospect by no means pleases the inhabitants of the Department. It is said, and again denied, that Pope Leo XIII. favoured the project of the Rothschilds when mooted some years ago; and that he sent a messenger to the General of the Order strongly urging the abandonment of the manufacture. The *Osservatore Romano*, however, denies that this was so.

There has occurred friction between Rome and the Order on other occasions; notably, when, after the taking of Rome by the Italians, Pius IX., feeling the loss of his income through the absorption of the Papal States into Italy, sought indemnification through Peter's Pence. He then demanded of the Carthusians an annual subvention of a million francs. This they considered as extortionate, and the General remonstrated. The pope insisted. Thereupon, the General lost patience, and declared that the Order would only pay into the papal coffers what it chose, and would bind itself to no particular sum. As may be imagined, such opposition did not meet with favour at the Vatican, and the Benedictines have been encouraged to rival the Carthusians with a liqueur of their own composition; so also have the monks of Tre Fontane, with the 'Eucalyptica,' derived from the Eucalyptus plantations in the Campagna near Rome; but none of these can, in the estimation of connois-

seurs, equal the delicate flavour of the Chartreuse. This liqueur leaves the monastery of the Grande Chartreuse, in Dauphiné, in peculiarly formed, low, broad bottles, with the label and seal bearing the arms of the convent and the letters 'D.O.M.' (Deo Optimo Maximo) as pledges of genuineness.

It must not be supposed that the monks are engaged in distillation of spirits and the mixing of herbs and bottling of liqueur. They live apart from the manufacture in their abbey in the High Alps of Dauphiné, and the manufacture takes place in extensive factories in the same mountain basin, but disconnected with the abbey. This abbey of the Grande Chartreuse is the headquarters of the Order, which has other houses in France, Italy, Switzerland, and Austria—in all, fifteen. The manufacture is carried on by paid operatives, and the village population is employed in the collection of the requisite herbs. Some of these are becoming scarce owing to the extent to which they have been gathered. The herbs are mixed with *eau-de-vie*, which is purchased by the abbey, not manufactured by it, and then they are distilled along with the spirit. Only one of the monks, the Steward, supervises the operations; and only one of these operations is conducted in secret, and that is the mixture of the herbs, in which consists the secret. The rest of the brothers of the Order have nothing whatever to do with the manufacture; they follow their silent, quiet life independent of it.

The manufacture of Chartreuse is of comparatively modern origin. Till 1835, in the Grande Chartreuse alone, an elixir was made of certain herbs steeped and distilled in brandy for medicinal purposes; and it was solely as a remedy that the original Chartreuse was employed and distributed by the brothers. That their decoction would become a liqueur for the palate of luxury never occurred to them. In time, however, both the manufacture was improved and the fame of its excellence extended; so that the rude old workshops in which the brothers distilled the herbs no longer sufficed, and new buildings were erected, and operatives came into that Alpine basin to lend their aid to the perplexed and overworked brothers. Now, the manufacture has called into existence quite a small town. Formerly, three kinds of Chartreuse were made—the white, the yellow, and the green; but the white has been abandoned of late years. The green is both the strongest and the most expensive. There is more alcohol in the green than in the yellow. It is hinted that the reverend fathers themselves regard a blend of the two as the perfection of the liqueur in the proportions of one-third green to two-thirds yellow.

Near Florence is the Certosa, in the Val d'Emmo, where the Carthusians also manufacture a Chartreuse liqueur, green, deliciously flavoured with angelica. The monks are suppressed, and only a few old ones linger on, and are not permitted to take novices. Hence their Chartreuse will probably perish with them. In Florence itself the Dominicans of Sta Maria Novella had also their manufactory of elixirs and scents. They have been dispersed, and the Government has sold their manufactory, their very pots—and portraits of the inventors of the several elixirs—to speculators, who are installed in their room, and who trade

on the old credit of the manufactures of the banished friars.

Will the Chartreuse of the future have the qualities in such perfection as that of the present? Will the guarantee of a Joint-stock Company be as reliable as that of the Order of St Bruno? The amount of Alpine plants is limited. More than a certain quantity of the liqueur cannot be sent forth in the year, and this it is which gives to the Chartreuse its high cost. We can hardly expect that a Company will be as scrupulous in adhering to the receipt. Let us hope that the good brothers will not sell their secret and their factory, but still send forth the bottles labelled D.O.M.

MRS LAMSHED'S WILL.

IN FIVE CHAPTERS.

CHAP. I.—MR DOTTLESON IS PUZZLED.

MR MONTAGUE DOTTLESON, East India merchant of Calcutta and London, was writing letters in the library of his private residence in Blakewood Square, Kensington. It was Sunday afternoon, and the rain was coming down with steady persistency, as though it had made up its mind to keep Londoners indoors for the rest of the day. Mr Dottleson, who was a methodical man in everything, made a regular practice of going for a long walk every Sunday after lunch; and when the weather presumed to interfere with this arrangement the effect upon his temper was infelicitous. Accordingly, it is our misfortune to present him to the reader at a moment when he is decidedly snappish and surly.

'Very aggravating,' said he, throwing down his pen and going to the window; 'no chance of its clearing up either. How I detest a wet Sunday!'

He picked up a book, and made himself comfortable in an armchair; but he had hardly read a page when the door opened and his daughter Kate appeared. She was a fair, pretty girl of twenty, whose gentleness and tact saved her from coming in collision with her irascible parent at times when other members of the household shrank from the consequences of intruding upon his privacy.

'Well, what's the matter?' asked Mr Dottleson curtly.

'Grandmamma isn't feeling very well this afternoon, papa.'

Kate had not completed her errand, but knew from her father's manner that she had come in at a time when it was best to say as little as possible; when he was in this humour, he was certain to jump at any opportunity for grumbling, and would finish her message for her.

'She wants that doctor, I suppose?' snarled Mr Dottleson.

'Perhaps we had better send for him.'

Mr Dottleson threw down his book and frowned savagely. 'Isn't it a very singular thing, Kate, that your maternal grandmother should select this impecunious young prig Lakeworth to be her medical attendant, when there are half-a-dozen experienced practitioners living within a stone's-

throw of the square? Isn't it very curious that Mrs Lamshed never knew what illness was or asked to see a doctor until she met this Dr Lakeworth at Scarborough last summer? Her confidence in him is positively touching, and passes my comprehension altogether.'

It was evidently a mystery to Kate also, for she shook her head slowly and looked out of the window. It was a fad of her grandmother's to have Dr Lakeworth; and when a patient has reached the eighties, perhaps one physician can do little more than another.

'I don't know why she likes him, papa.'

'I suppose you must send for him; but I don't imagine he will thank Mrs Lamshed for bringing him through a mile and a half of back streets on a day like this, just to tell her that her heart is much the same as it was the day before yesterday.'

Kate left the room without making any reply, and her father walked over to the hearthrug and proceeded to address the figure he saw reflected in the mirror above the mantel-piece. Many people have a habit of 'talking to themselves,' and Mr Dottleson cultivated it to a remarkable extent; it was his peculiarity, though, that he could not take himself properly into confidence unless he saw himself in the glass. He stood with his left hand thrust into his waistcoat pocket, emphasising the remarks he made half aloud with his right forefinger.

'Now, will you have the goodness to tell me what my mother-in-law wants with this young medico? He's got no practice to speak of; he's got nothing any one can see to recommend him, and he lives most inconveniently far away. Ever since she met him last year, she has required medical advice, and no advice but his will do. When she thinks she's seedy, he's called in to earn a fee; and when she's well, he's called in to receive it. He's never out of the house. I wonder he doesn't take lodgings next door, to be close to the gold mine.—I tell you candidly,' continued Mr Dottleson, suddenly withdrawing his hand from his pocket and tapping the palm impressively with his finger-tips—'I tell you candidly that if I didn't know the old lady would alter her will without compunction, I'd forbid Dr Charles Lakeworth the house.—Why, bless my heart! if Mrs Lamshed lives ten years longer, she'll spend every shilling of her twenty thousand in physic and fees.'

This final prediction, although made by himself, so worked upon Mr Dottleson that he swung round upon his heel and stamped on the floor.

Mrs Lamshed, who was the mother of his departed wife, was eighty-one years of age, and in spite of her frequent calls for the doctor, gave every promise of maintaining her interest in mundane affairs for ten or even twenty years longer. 'I'm an old woman,' she was wont to say; 'but I was an old woman when I was forty, and I haven't grown a day older since—not a day.'

And indeed Mrs Lamshed seemed almost as active and sprightly now as she had been half a century ago. Fourteen years before, the middle-aged, dust-dried lawyer who looked after her concerns had come to urge the desirability of making her will.

'Make my will!' cried she. 'I'll make it, if you're afraid you won't live to do it, Smuggles;

but I hadn't begun to think about it yet! Why should I? However, the solicitor's arguments prevailed, and the thing was done, 'to oblige her old friend, who had always taken good care of her affairs, and was in a hurry to finish them.' And though the fact has no bearing upon this story, we may mention that the engrossing of Mrs Lamshed's will was the last bit of professional work the careworn Smuggles ever did for his client. He was twenty years her junior; but he passed from Lincoln's Inn to another place long before she began to use spectacles. The spring of vitality was strong in Mrs Lamshed.

Mr Dottleson turned away from the mirror to which he had been confiding his woes, and went up-stairs to see his mother-in-law, whom he found in the drawing-room with Kate.

'I'm sorry to hear you're not well,' he said, going to her side.

The old lady looked up and smiled. 'I'm getting very feeble, Montague, though I don't look it. I am not quite up to the mark, and thought I'd like to see Lakeworth.'

'They sent for him half an hour ago. But don't you think, now, that a more experienced man should be called in?'

'Lakeworth will do nicely, Montague; he understands my constitution.'

When an old lady is convinced that one particular man 'understands her constitution,' no reasoning will move her. Mr Dottleson knew this, and did not press the expediency of making a change.

'What do you think is wrong, this time?' he said, sitting down near her.

'It's the heart,' replied Mrs Lamshed with a deep sigh, which did not seem quite genuine somehow.

Mr Dottleson tried to put on a look of grieved anxiety, but only succeeded in appearing sulky and incredulous. 'I trust not—I hope you're mistaken,' he said. 'I must speak to Dr Lakeworth when he comes.'

His tone implied that he held the young man personally responsible for the condition of Mrs Lamshed's heart, whatever it might be, and intended to know what he meant by it. He rose as he spoke and went back to the library, where he tried to interest himself once more in his book.

'I don't think papa likes Dr Lakeworth,' said Kate, as soon as the door had closed behind her parent.

'I don't know why, I'm sure; but he doesn't seem so pleased to see him as you do, child.'

Kate laughed a little, and said no more. It was *her* heart, and not her grandmother's, which gave reason for Charles Lakeworth's frequent visits; and the eagerness with which she pounced upon any excuse for calling him in to see Mrs Lamshed had been a fruitful source of amusement to that lady, until she allowed Kate to see that she understood the manoeuvre.

Mr Dottleson had never thought of his mother-in-law's favourite in connection with his daughter. He was essentially a grasping mercenary man, and the fear always before his eyes was, that Mrs Lamshed might alter her will and bequeath her property to this doctor. He had heard of ladies who had cut off their rightful heirs in favour of their medical attendants, and Mrs Lamshed was

eccentric enough for anything. If any one had told him that Kate was the attraction, he would have laughed at the idea. She had nothing, and would have nothing but what he chose to give her; and it was not likely that a man who had to push his way in the world would encumber himself with a wife. Dr Lakeworth was dancing attendance on the old lady in the hope of getting her money, and really she seemed so fond of him that the danger was making him very uneasy.

He got up and opened the door slightly, that he might hear the doctor's arrival, and also ascertain whether Kate stayed in the room during Mrs Lamshed's interview with the young man. Dr Lakeworth went straight up-stairs when he came, and remained with the two ladies for fully an hour and a quarter, whilst Mr Dottleson sat fuming and fidgeting in the library below.

'Much value the fellow's time must be,' he sneered, looking at his watch, when the door up-stairs opened, and Mrs Lamshed's shrill cracked voice arose, cautioning the doctor not to forget that he had promised to come and see her on Tuesday.

'I'll waylay him as he goes out, and find out, once for all, whether there's any actual necessity for these incessant visits.'

'Good-afternoon, Mr Lakeworth,' he said, meeting the doctor in the hall. 'Just come this way for a moment, if you please.' He led the way into the library, motioning the young man to follow him with the pompous air which had gained him the sobriquet of 'Majestic Monty' among his City friends.

'I wished to ask you whether there is any cause for anxiety regarding Mrs Lamshed's health,' he said when Charles Lakeworth was seated.

'Mrs Lamshed is under the impression that she is suffering from some internal malady; but I am unable to detect anything amiss. Of course any organic complaint would be serious to one of her advanced age; but I have no reason to suppose there is the least cause for anxiety.'

Perhaps the confident tone of Dr Lakeworth's reply irritated his questioner; for Mr Dottleson put on his most majestic air, and fixing his *pinenez* on his somewhat rubicund nose, he elevated that feature until he could bring his dull fish-like eyes to bear upon his companion. 'Is that your opinion?' he asked with light stress on the possessive pronoun.

'That's my opinion,' responded the doctor quietly.

'Then there's no actual necessity for your rather frequent professional visits?'

'I can do nothing for Mrs Lamshed but allay her fears about herself. They are groundless; but a lady of her years is naturally prone to make much of any little feeling of indisposition.'

Mr Dottleson lay back in his chair, considering what he had better say next. If he made any attempt to discourage Dr Lakeworth's calls, it would infallibly come to his mother-in-law's ears, and her resentment might produce results very detrimental to himself. It would not do to attack the position from this side, when he had only his suspicions to work upon; it would be less risky to go to the root of the matter with Mrs Lamshed. He rose from his chair and extended his hand. 'I'll say good-evening, then, Mr Lake-

worth: you have relieved my mind very much regarding your patient.'

Charles Lakeworth left the house, and Mr Dottleson went in search of his mother-in-law. He meant to lose no time in putting her on her guard against this insidious enemy; but he knew that he would have to approach the subject very carefully.

'I am very pleased to learn from Dr Lakeworth that your fears about yourself are unfounded,' he said cheerfully.

'Oh yes; he thinks I'm all right,' replied Mrs Lamshed. 'I've great confidence in Lakeworth.'

'I'm afraid he takes advantage of it to drain your purse pretty heavily in fees.'

'He wants 'em,' replied the old lady dryly. 'Poor fellow! he finds it hard to make both ends meet. But he'll make his way; I'm going to help him.'

It was bad enough to hear that this hanger-on was sent for more to benefit himself than the patient; but Mrs Lamshed's last words made Mr Dottleson turn red with anger. 'Help,' in his vocabulary, was synonymous with money, and here was his mother-in-law coolly telling him, her heir, that she was going to give help to an utter stranger who had no claim upon her whatever. It was quite time that he did speak to her, so he cleared his throat and began without more ado: 'You know that of late it has often occurred to me that Dr Lakeworth's attention to you is not so disinterested as it should be. I may be wrong, but I cannot get over the idea that he has some ulterior designs upon us.'

Mrs Lamshed put on her spectacles and stared at her son-in-law. 'Do you suppose I'm a fool, Montague Dottleson?'

'My dear madam, you misapprehend my meaning,' said Mr Dottleson with anxious suavity; 'but really I have known such frequent cases in which kind-hearted ladies have been led away by their gratitude towards scheming physicians. I never for an instant imagined that Dr Lakeworth or any one else would be able to bend your sturdy sense of what is right and just so as to serve his own interests; but he comes so frequently, he stays so long, and'—

'And you think Lakeworth expects my money when I've done with it, and comes here to keep my friendship for him alive?'

'I am bound to confess that this had crossed my mind.'

The old lady leaned over, and tapped her son-in-law gently on the knuckles with her spectacle case as she replied: 'You are the fool, Montague Dottleson. You're as blind as a mole. If you hadn't betrayed these unworthy suspicions about an honourable man, I might have opened your eyes for you; but since you have such an undeservedly bad opinion of him, I shall leave you to grope your own way to daylight. I've made my will, Montague, and you know what it says; but there's plenty of time to add a codicil to it, you know—plenty of time.'

Mr Dottleson saw that he had made a grave mistake in mentioning his distrust; but he could not repair it now, and beat a hasty retreat. Mrs Lamshed had hinted broadly that there was something going on which he was too blind to see, and which she was going to let him find out for himself. Whatever it might be, he would be very

cautious in making his investigations; that remark about the possibility of making a codicil had gone home, for he knew it had not been spoken idly. The will as it stood was in his own favour. Mrs Lamshed had bluntly observed when she made it, that Kate was only six years old, and there was no knowing what she might grow up like; so her money should be left to one who would at least take care of it—namely, Montague Dottleson. She had a higher opinion of her son-in-law at that time than she had now; but he had always been kind and attentive since she went to live with him, and she had seen no reason, so far, to alter her designs.

'What can the man be after, if it isn't the money?' queried Mr Dottleson on the hearthrug of Mr Dottleson in the mirror. 'He can't be so much attracted by Kate. She's a pretty girl and a good girl; but she's got nothing. Then, again, her grandmother was always of a saving turn of mind, and she wouldn't encourage him to pay expensive visits if she had no object in view. It's absurd to suppose that she pays him to come here for nothing. If he admired Kate, he'd come without being sent for, and her grandmother can't fail to know that.'

His mental vision had been so dimmed by the atmosphere of money in which his life had been passed, that he did not understand the possibility of man or woman being guided by any other motive. Love was a misty unreality outside the pale of his reasoning powers, and therefore did not enter into his speculations at all. His affection for Kate took the characteristic shape of finding a wealthy husband for her; she might choose for herself, as she had a right to; but measuring her heart by the size of his own, it never struck him that her choice might fall upon a man whom he would reject as ineligible.

THE LINCOLNSHIRE 'WARPINGS.'

A WASTE of soft brown mud, glistening in the sun, save where it is overgrown with a matted carpet of rankest, greenest water-weed, or shadowed by a tall forest of gray-plumed reeds. Here and there a solitary post, or a long line of short stumps and rails—all that is still visible of what was once a five-foot fence—throws its dark reflection upon the smooth surface as upon a mirror. Countless birds of the sort that delight in marshes and still pools wheel through the air, run over the flats, or swim in the narrow channels that wind in and out in all directions between sloping banks of mud. You stand upon a low reed-fringed bank, raised by man's hand above the dead level of the surrounding country. In front, as also to right and left, stretch similar banks—the dark frame enclosing the scarred mirror of mud between. Behind you, far away in the blue haze, a line of small hills bounds the horizon. It is low-tide on the 'warpings.'

Three hours have gone by. You stand, as before, on the bank; but all is changed except the banks and the hills. Before you ripples a sea of turbid water, brown as the mud, which it has covered, and breathing still a salt breath of the sea from which it has come. The flats, the pools, the patches of green weed have disappeared. The very reeds have vanished, all

but their feathery heads that sway and nod, in a drowned way, just above the surface. The birds, too, are gone, save where a few gulls scream and tumble about some floating fish, or a flight of wild-ducks whistle in the invariable wedge-like order through the evening sky. The water eddies at your feet, ruffled by the rising breeze, splashes spitefully against its banks, and hurries on with knots of white spume staring its brown flood. It is high-tide on the 'warpings.'

All along the banks of the Trent and the Yorkshire Ouse lie acres of land reclaimed from the sand and heather that once were their sole produce. Now they are golden with corn-fields or green with the dark forests of potatoes for which Lincolnshire is famous. Between the cras of wilderness and cultivation came that of warping, when the soil lay alternately drowning under the flow, starving under the ebb of the great tidal rivers. For it is the river that has wrought the change and spread fertility over the once sterile ground. In a few years, when the soil is again exhausted, the fields of potatoes and corn will again disappear beneath the waters, to emerge revived by their power.

Twice in the twenty-four hours the tide rushes up from the Humber, covering the interminable sandbanks that choke the great estuary, and the long flats that skirt the river's banks; and as it comes, it sweeps on with it always a new load of silt, stolen from those flats and banks, to be deposited wherever the tide reaches in a soft, smooth, fertilising layer. Each tide will leave its contribution. When the flow is less strong, it brings a lighter quantity of silt; but when the change of the moon brings stronger tides, when the east wind forces the waters of the North Sea westward in greater volume, the river rises in its might. The in-coming flood, pent back by the sand-bars of the Humber, rears up in a wall of discoloured water, and sweeping forward with a hoarse murmur from shore to shore, gathers fresh force and height as it crowds within the narrowing banks, until it forms a resistless torrent seven or eight feet above the level of the stream up which it rushes. It goes ill then with any boat which lies too near the shore or rides at too short an anchor. Everything must yield to the flood. The click of the capstans as the cable is paid out echoes over the river long before the roar of the 'eagre' is heard; and the barges lie with slackened chain ready to rise on the sudden wave—for rise they must or be buried in the whirl of foam and mud. The heaviest vessel is lifted up and tossed round like a cork; and as the 'eagre' rushes along amongst the stones and reeds, it tears up the mud—'warp,' as it is named—in huge mouthfuls, churns it up in its murky eddies, and carries it far away up the stream. In three hours' time the tide is spent. From bank to bank the river is full to the brim. Mud-flats, reeds, and stones have alike disappeared; and from far away in the fields about you may see the very hulls of the barges sailing on and the sunlight glittering on the metal-work of the great coal-steamers as they pant up the now silent river.

It is this flood which, like that of the Nile, is turned to account by the farmers whose lands march upon the Trent and Ouse. Throughout

the lower reaches of the two rivers the banks are studded with black doors or shuttles of solid timber framed in strong masses of stone. Behind is a 'dyke' or 'warping drain,' through which the river is led to the required spot. Sometimes this dyke will be twenty yards or more across; often less than half that width. The doors, opening outward towards the river, enable the keeper to control the tide as he pleases; for if they are once closed, the strongest pressure from without only closes them the more tightly. But when they are set wide and the river is rising, the thunder of the stream as it rushes through the narrow entrance, lashed into creamy whiteness in its downward plunge, boiling, eddying, foaming, shaking the solid masonry above like an earthquake, makes itself heard for miles over the low lands beyond. So swiftly comes the tide, that no doors can admit it fast enough; the level of the water in the dykes is always below that of the still rising river. Even when the river has ceased to rise and the ebb has been long in progress, the water still plunges furiously through the 'drain-heads' to seek the lower level of the drain within.

No artificial means are needful to carry the water to the destined spot. The broad area that lies between the wolds of Yorkshire on the one side and those of Lincolnshire on the other—the basin of the Trent, Ouse, and Don—is unbroken for miles by any elevation. Far as eye can see, extend the so-called 'Carrs' or 'Levels,' intersected by dykes, dotted with farmhouses and hamlets, and sparsely varied with such trees as love the lowlands and are of speedy growth, willows, aspens, elders, and poplars. But no hill, not even a knoll or an artificial barrow, breaks the monotony of the view; and the river is restrained only by its well-kept banks from submerging the surrounding fields. At odd times, under the strain of a rainy autumn or a flood-tide of unusual height, the bank gives way. A narrow crack opens in the rampart of clay. For a moment the water spurts through in an inoffensive jet; an instant later, the bank yawns from top to bottom, and the river bursts out in a mighty torrent. The solid walls of earth that have stood for years are torn down like a child's sand-castle on the beach; the crops are ploughed up and swept away; and the desolation is only checked by some intervening bank that marks the area of some old 'warping.' But such floods are rare. Experience has taught the necessity of maintaining the banks in good order—experience bought of up-torn roads, of corn-sheaves rotting in the mud, and above all, of acres of potatoes submerged and slowly rotting away. For the farmers of North Lincolnshire and of Ireland alike pin their faith to the crop of 'tatars.'

And yet the same flood which can ruin in an hour a whole season's labour, becomes, when controlled, the Lincolnshire farmer's greatest ally. It is not many years since the land from Gainsborough to Goole, and from Goole to Hull, was a marshy waste, not unlike the Essex salttings, where only some solitary gunners could find subsistence by shooting and netting amidst its countless thousands of wildfowl. Now it is a land of corn and pasturage—not a rich land, perhaps, and not beautiful as are the Shropshire

plain and the weald of Kent; but yet the outlook from Alkborough Cliff, where the Lincolnshire hills abut in a steep spur upon the junction of the Trent and Ouse at their foot, is wonderfully pleasing. Eastward lies the Humber, reaching away to Spurn and the German Ocean. Northward the Ouse winds in and out amidst its 'levels,' through Goole, with its docks and shipping; through Howden, nestling amongst its elms, where is still held one of the oldest horse-fairs of horse-loving Yorkshire; by Cawood Ferry, where Dick Turpin crossed the stream on his famous last ride; by Selby, whose tall spire is a landmark for miles around; and on to York, whose towers may be dimly seen through the haze on a clear day. Westward lies the Trent, bright as silver; and amongst the wide corn-lands that lie between the twin rivers gleams now and again the smaller stream of the Don, upon whose banks, on the farthest horizon, the Romans have left their memorial in Doncaster—'the fort upon the Don.' Alkborough Cliff is the termination of those hills which form the eastern boundary of the vale of Trent. To your right and left they slope to the very verge of the river and its estuary, and reappear far beyond in the bolder and loftier Yorkshire wolds. The hamlet lies at your back, half hidden in the trees; and your feet stand upon an old-fashioned circular maze. Below, in the river—barely a stone's throw distant, it seems—the keels and schooners are lying at anchor; and you catch the click of the cables again as they prepare for the incoming tide, or the faint stroke of the shipwright's mallet where the trees hide the diminutive dockyard of Burton, below the slope, on your left. Truly, the old Saxon who first beached his *ceol* at the hill foot and established himself here, can have had small idea of the rich scene of town and village, crops and herds, which his descendant of this century should look upon from this same Alkborough Cliff.

ARMSTRONG'S REVENGE.

ONE bright June morning not many years ago, a big ungainly farm-servant, holding by a halter a large and uncouth plough-horse, stood before the shut door of a battered wooden building, the surroundings of which at once proclaimed it to be a smithy, although through the chinks in its weather-beaten walls no forge-fire gleamed or cheery hammer rang. The ploughman, astonished to see the place shut at an hour long after that at which the blacksmith usually started work, retired a pace or two and gazed up at the chimney; and not seeing even the faintest trace of smoke issuing thence, he turned and looked about him with a puzzled expression on his face. A man breaking stones on the other side of the road, noticing the farm-servant's bewilderment, approached, and, after the usual morning salutation, proceeded to explain what had befallen the blacksmith. We will give that explanation in our own words.

Hamilton Armstrong was the name of the blacksmith in question. His workshop was situated close to a wayside station on the main line of one of the great Scotch railways, but at a considerable distance from any town or village. Being, however, kept pretty busy at work for the neighbouring farmers, and being consequently well-to-

do, and having, moreover, as his nearest female neighbour, a very pretty girl, the daughter of the porter at the station, it was the most natural thing in the world that he should wish to make her his wife. Unfortunately, this was more easily determined on than done, for he had a rival. This rival was the driver of a goods-train which was almost daily shunted into the siding near Sarah's house, to allow of a passenger express passing, and who took advantage of this momentary respite to chat with the porter's daughter. Whether it was because he was a far-away bird that his feathers seemed fairer than Armstrong's in Sarah's sight, or whether he was intrinsically a man of more worth, the gossips—for there were gossips even in those solitudes—were not agreed. Rightly or wrongly, however, Sarah gave him the preference.

Having made up his mind to ask Sarah to be his wife, Armstrong was not long in finding an opportunity for doing so. Though he knew he had a rival, he was hardly prepared to hear from Sarah that she had already promised to marry Duffy, the engine-driver. But Armstrong was not going to yield without making a special effort to win her. He pleaded long and fervently with her to retract her promise to his rival, whom he was persuaded she had only accepted because he had been the first to ask her. But Sarah was quite sincere, Duffy being really the man of her choice; and Armstrong pleaded in vain.

For the next week or two, the blacksmith moped about and did scarcely any work. On the day on which Sarah's marriage was to take place he left the smithy in the evening, and went wandering into the country, returning late at night. Next morning, he went away again, now walking with uneasy step along the quiet country lanes, and now sitting dejectedly by the roadside, muttering to himself. The neighbours soon came to hear of his strange behaviour; and it was whispered that he must have gone out of his senses, as an uncle of his had done under a similar affliction.

'That was yesterday,' the stone-breaker wound up, 'and he's away along the road by the railway this morning. They should look after him, or he'll be lying down in front of some train, or jumping down into the deep rock-cutting and breaking his neck.'

If Hamilton Armstrong had not gone mad as the people supposed, he certainly acted like a madman. Stung to the quick by his rejection, he had no heart for his work. He shut up his smithy, and went out to try to walk off the fever that burned within him. Proceeding along the path by the side of the railway, his heart filled with bitter hatred, the idea of taking a terrible revenge upon Duffy gradually shaped itself in his mind. At first, he tried to shut his ears to the suggestions of the tempter; but little by little he grew familiarised with the idea, until he got so demoralised that he began to think in a speculative way how he could best avenge himself upon the engine-driver. Duffy's train always passed the station, going east, about half-past seven in the evening. Shortly before it came the twenty-seven minutes past seven passenger train. The device of placing an obstruction on the line suggested itself, only to be immediately set aside.

At this point in his meditations, the sound of a signal going down suggested to him the idea of tampering with the signals.

He returned home and retired to rest. Tossing restlessly on his bed, he was revolving in his mind his various schemes of revenge, when a diabolical idea struck him of a plan whereby he would be able to accomplish his object without leaving any trace of foul-play, so that the whole blame of the catastrophe would fall upon Duffy, who would not survive to tell his side of the story, or even if he did, and asserted his innocence, would not be believed. Armstrong noticed that if the counter-weight at the bottom of the signal-post were lifted up, it would allow the signal-arm to go down, just as if it had been lowered by means of the lever in the signal-cabin, the wire between the cabin and the counter-weight remaining motionless all the time; while as soon as the counter-weight was lowered again, no trace would remain of the signal having been touched. By adopting this mode of lowering the signal, the objection to his last-mentioned plan would be done away with. The only danger would be that the pointsman might notice that the signal was down; but that was not likely, as the lifting of the counter-weight would not affect the lever in the signal-box, and it was improbable that the signal-man's eyes would be drawn towards the signal when he was not either lowering it or pulling it up. This plan would enable Armstrong to get some distance away, and so prevent suspicion fastening upon him; and the fact of the signal being found all right afterwards would preclude all possibility of a suspicion of the signal having been tampered with.

Armstrong had begun his speculations with the view only of discovering how he could be avenged on Duffy, if he wished to avenge himself. The successful issue of them in a plan securing at once death to his rival and immunity from detection to himself was the cause of his resolving to go further. Thus by imperceptible degrees he had been drawn into plotting to murder.

In an almost gleesome mood he rose in the morning and hastened along the embankment to the signal which he proposed to use for his dreadful purpose. The signal stood at about the deepest part of a long rock-cutting, and was planted on the slope of a small embankment above the cutting. An examination of the place satisfied Armstrong that the best plan to adopt would be to attach a long cord to the counter-weight, and, taking the cord in his hand, to climb the signal-post, so as to command a long stretch of the line and be able to lower the signal-arm at the right moment; for to be a moment too soon or too late would be fatal to his plan.

His plan was now matured; but a long period of waiting elapsed before an opportunity for carrying it into effect presented itself. With the patience and perseverance of a wild animal waiting for its prey, he betook himself evening after evening to the signal by various roundabout routes, so as to ensure that no one would know that he went to the same place every day, affixed his cord to the counter-weight, and waited—only to see the passenger train dash past without slackening speed and pass the distance-signal without stopping.

At length, when the days had crept in consider-

ably, and thus rendered the evenings more suitable for the carrying out of his plan, as one evening he listened anxiously in the dusk to the sound of the approaching passenger train, a thrill of pleasure shot through him, for he noticed that it was slackening speed. Taking the cord in his hand, he climbed rapidly up the signal-post, and was overjoyed to find the passenger train stopping just on the station side of the distance-signal. Trembling with excitement, he turned in the direction whence the goods-train would come and anxiously awaited the sound of its approach. Several seconds, which to him seemed hours, elapsed before there was any sign of the approach of the goods-train. The passenger train, however, still stood at the distance-signal, throwing up long oblique lines of light into the misty air. At length with fluttering heart he caught the faint sound of Duffy's train approaching, and soon the head-lights, overshadowed by a cloud of steam, golden with the furnace-light, began to twinkle dimly, like stars at twilight, in the distance.

'Now or never,' thought Armstrong, taking two or three turns of the cord round his hand. He then tugged lustily at the cord; but the counter-weight would not rise. With an oath, he twisted his legs round the signal-post, passed the cord through the lattice-work a little above him, so as to obtain a better purchase, seized the cord with both hands and pulled with all his might. The weight yielded to this violent effort: the signal-arm descended. Armstrong's wild laugh of joy at the accomplishment of his nefarious purpose was almost immediately stifled by a cry of terror and pain. In his excitement he had forgotten that his head was immediately below the signal-arm, and his savage tug at the counter-weight had brought the signal-arm down upon his head with terrible and fatal force. His nerveless limbs loosened from the signal, and falling with a thud upon the sloping embankment, he was shot over the edge of the sheer precipice that formed one side of the rock-cutting and landed upon the opposite line.

Meantime the goods-train had entered the rock-cutting. The signal-arm having been lowered until it was in line with the signal-post, and having been checked by the entanglement of the cord in the lattice-work when it had only returned half-way, stood at clear. But for this accident, Armstrong's fiendish scheme would have been frustrated; for the support being taken away from the counter-weight, it would have descended, and so elevated the signal again. And now, to gratify one man's jealousy and hatred and punish one man, a hundred innocent men and women in the passenger train were to be sacrificed.

As the goods-train came on rattling and roaring through the cutting, the driver and stoker, all unconscious of the imminent peril in which they were, stood on the footplate watching the signals and the line in front of them. A glance at the signal, as he caught sight of it, showed Duffy that it stood at clear. His eye then wandered downward towards the rails, when suddenly it was arrested by a dark object lying on the other line.

'That's surely a man lying on the up-line, Tom,' he remarked to his fireman, laying his hand upon the regulator.

'Good God, so it is!' cried Tom in great excitement.

Without another word the steam was shut off, the link-gear reversed, and the brake applied; for the two men knew that the up-express was due in three minutes, and that if the man who was lying on the line—who might be unconscious through drink or through having fallen over—was left there, he must inevitably meet with a horrible death.

As the train stopped with a shock and a bumping of buffers and clanking of coupling-chains along its whole length, Duffy jumped down into the six-foot way with the engine lamp in his hand. Bending over the huddled-up form, he held the light above the blood-covered face and peered into it. A few seconds elapsed before Duffy moved; and Tom, wondering why he knelt so long looking into the unconscious man's face, jumped down beside them and asked: 'Is he dead, Duffy?'

'Yes,' answered Duffy, raising his head as if he had just wakened out of a dream.

'Who is he?' continued Tom.

'Armstrong the smith.'

At this moment the brakesman of the train came along to see what was wrong; and after Tom had explained the matter to him, they lifted the dead man and carried him to the van. Duffy and Tom then returned to the engine, and were just about to start the train to advance to the station and see what could be done with Armstrong, when Tom caught sight of some one running along the line with a lamp in his hand.

'What's up?' cried Duffy.

'Who can this be, and what can he be wanting?' asked Tom.

At this point the man with the lamp approached the engine; and when he had come within the light of the furnace, the two men recognised him as the signal-man. 'It's a blessing you noticed it!' he cried, panting with the exertion of running so fast.

'Noticed what?' both men on the engine exclaimed simultaneously.

'Something's wrong with the signal. It's standing at clear just now, and yet the lever's right for danger. I heard you passing it without slowing up, and then I noticed the signal was wrong. I'm glad you saw the train in front in time to pull up.'

'Is there a train in front?' Duffy asked.

'There is. The seven twenty-seven passenger's blocked there by a truck that went off the rails.'

All at once the whole matter became clear to Duffy. Armstrong had been trying to wreck the train, and had apparently fallen down into the cutting when putting the finishing touches to this trap for his enemy. Although Duffy thought this perfectly plain, he did not breathe a word of his thoughts to those around him. Was not his enemy lying dead in the van? He would let bygones be bygones.

'No, we didn't notice that,' he said to the signal-man. 'We stopped because we saw a man lying on the up-line.'

Here the signal-man climbed on to the engine, and the up-express went thundering past, creating a miniature and momentary hurricane as it went.

'It's Armstrong the smith,' added Duffy. 'He's dead.'

'Is that so?' the signal-man exclaimed, and then lapsed into silence, feeling unable to say anything appropriate to the circumstances.

'I'll go up with you and see what's wrong with the signal,' Duffy said to the pointsman after a pause.

Reaching the signal, they found the cord, loosened it from the trellis-work of the signal-post and let the counter-weight fall again. It had not suggested itself to the signal-man that any connection existed between the dead man on the line and the mysteriously lowered signal; but, in spite of Duffy's reticence, the cause of the accident became perfectly apparent to him when he saw the cord attached to the signal counter-weight, and put that fact and the fact of Armstrong's being found dead on the line together.

'If ever anything was providential,' said the signal-man, as he and Duffy returned to resume their respective duties, 'this is. Here's a man that intends to wreck your train; he falls over the embankment just when he gets the thing arranged; then you come on seemingly to a certain smash, when you happen to see his body on the line, pull up just in the nick of time, and are saved.'

The signal-man had not probed the matter to the bottom; for the exact purpose of the cord had not occurred to him any more than it had to Duffy. Duffy was pained at the signal-man's discovery of the crime, and said nothing.

When they had reached the train, and the signal-man had told his version of the story to Tom and the brakesman, Duffy, who had stood aside while the story was being narrated, approached the men, and said: 'Now, lads, you know what Armstrong was trying to do, and why he did it; but that's no reason why anybody else should know. We'll not say a word about the signal; but when we take back the corpse, we'll say that we found him dead on the line, and that he had seemingly fallen over the embankment down into the deep rock cutting, and been killed.'

The three men solemnly promised to do this; and in spite of the *post-mortem* examination, in the report on which considerable stress was laid upon the peculiar nature of the wound upon the scalp, and the procurator-fiscal's inquiry, no one ever elicited more from these men than Duffy that night allowed them to tell.

Strangest fact of all, the engine-driver has never told his wife; that is the only secret he has from her.

SEA-SLANG.

THE nautical vocabulary is so varied and extensive, that there is some difficulty in distinguishing between sea-words and phrases that are technical and those which may fairly be called slang. Of the former, several collections have from time to time been made. The earliest is the *Accidence for Young Seamen*, published in 1626, by Captain John Smith, the historian of Virginia, and the hero of the famous Pocahontas story. It may be noted, by the way, as a curiosity of authorship that this, the first printed book on seamanship and nautical terms, was written by an army captain. More than one hundred years later, William Falconer, the author of the *Shipwreck*, published his *Marine*

Dictionary. The latest and most copious of these vocabularies is the late Admiral Smyth's comprehensive *Sailors' Word-book*, a work which, in addition to a very full collection of all technical sea-words and phrases, contains many purely slang expressions that are as familiar to the landsman as to the sailor. But apart from the words peculiar to the theory and practice of seamanship, there is a large number of special terms and phrases which either have been or are now in use among sailors, serving the same purpose as the many cant expressions in favour with shore-going folk.

The nautical names for some of the usual articles of food on board ship are suggestive of the coarse and unappetising nature of the fare. The stock dish of salt-beef is known as 'junk,' 'old-horse,' 'salt-horse,' and 'salt-junk.' Mr Clark Russell in one of his sea-stories declares that 'salt-horse' works out of the pores, and contributes to that mahogany complexion common to sailors, which is often mistakenly attributed to rum and weather. A savoury mess is 'lobscouse,' or 'scouse' as it is sometimes more shortly called. It consists of pounded biscuit, small pieces of salt-beef, and a few potatoes, boiled up together and seasoned with pepper. Smollett in *Peregrine Pickle* mentions the 'composition known by the name of lob's-couse' as one of the sea-dishes of which the genial banquet given in honour of Commodore Truncheon's interrupted wedding was entirely composed. A dish of cold fish and potatoes is known as 'twice-laid,' and may be considered as a near relation of the mysterious 'resurrection pie' of school-days, or of the familiar 'bubble and squeak.'

When midst the frying-pan, in accents savage,
The beef so surly quarrels with the cabbage,

as Peter Pindar sings in very limping rhyme. A pudding made of dried peas boiled in a cloth rejoices in the enticing name of 'dog's-body.' The hard ship-biscuits are called 'hard tack'; while the ordinary loaves of white bread to be obtained ashore are christened 'soft tack,' or 'soft Tommy.' The latter epithets will be familiar to readers of Marryat, and also to the many hearers of *H.M.S. Pinafore*, wherein the 'bumbat woman,' recounting her wares, sings of 'soft Tommy and succulent chops.' 'Midshipmen's nuts' are broken pieces of biscuit eaten by way of dessert. The late Charles Kingsley in one of his letters mentions friends who 'got midshipman's half-pay (nothing a day and find yourself), and monkey's allowance (more kicks than halfpence).'

A very old sea-name for gruel, and formerly for hasty-pudding, is 'loblolly,' but the use of the word has not been confined to sailors. Ned Ward, in the *London Spy*, speaks of coffee as 'Mahometan loblolly,' and Garrick, in his farce *Peep behind the Curtain*, says: 'My ingenious countrymen have no taste now for the high-seasoned comedies; and I am sure that I have none for the pap and loplolly of our present writers.' In old days, the surgeon's mate or doctor's apprentice was derisively termed a 'loblolly boy.' Poor Roderick Random talks of the rude insults of the sailors and petty officers, among whom he was known by the name of 'Loblolly Boy.' Days on which no meat is served out for rations have long been known on board ship as 'banyan days.' The name is said to be derived from a caste of Hindu traders or merchants,

the Banians, who practise total abstinence from all animal food. Lamb tells us that when he was at Christ's Hospital they had three banyan to four meat days in the week. It is a case of 'six upon four' when provisions run short, and rations are allotted in the proportion of four to six men. To food, naturally succeeds drink.

Many of the ordinary cant names for alcoholic liquor are used both by sailors and by landsmen; but there are a few terms peculiar to the sea. To 'splice the mainbrace' is to give out an extra allowance of grog. 'Six-water grog' is very weak liquor, six portions of water to one of spirit. Weak or poor drink is also sometimes called 'rumbowling.' Of the innumerable euphemisms for drunkenness, partial or entire, a few are of nautical extraction. 'Half-seas over' dates from the seventeenth century. It occurs in Dryden, and later in the *Spectator*, No. 616, in a lively letter professedly written by a country wit upon the occasion of the rejoicings on the day of the king's coronation, when 'the alderman was half-seas over before the bonfire was out.' The origin of the phrase is doubtful. It is often referred to the Dutch *op-zee zober*, or over-sea beer, a strong beer said by Gifford to have been introduced into Holland from England; but more probably its origin is purely nautical, and may be traced to the reeling motion of a vessel in a stormy sea. 'Three sheets in the wind' and 'a sheet in the wind's eye' are two more expressions strongly suggestive of the unsteadiness caused by intoxication. At Greenwich Hospital the cant term for drunkenness is 'yellow fever,' because the sailors when punished have to wear a parti-coloured coat in which yellow is predominant. 'Bulling the barrel' is an operation well known to sailors. When a spirit-cask is nearly empty, a few gallons of water are put into it to keep the wood moist and prevent leakage; this is called 'bulling the cask'; and, as old Tom in *Jacob Faithful* explains, what with the little spirits that may be left and 'what has soaked in the wood, if you roll it and shake it well, it generally turns out pretty fair grog,' which is known as 'bull.' To 'suck the monkey' is a phrase explained in *Peter Simple* as having originally been used among sailors for drinking rum out of cocoa-nuts, the milk having been poured out and the liquor substituted. It is now applied to the act of drinking on the sly from a cask by inserting a straw through a gimlet hole, and to drinking generally. Barham, in the legend of the *Black Monksquaire*, says:

What the vulgar call 'sucking the monkey,'
Has much less effect on a man when he's funky.

To 'tap the admiral' is a variant of this phrase.

Every one knows what a lubber is. The word is old: it is found in the earliest known English comedy, *Roister Doister*, written about 1550:

He is louted and laughed to skorne,
For the veriest dolte that ever was borne,
And voriest lubber, sloven, and beast.

'Lingering lubbers lose many a penny,' says thrifty Tasser. 'Lubber's hole' is a sea-term for any shirking of duty, from the name given to the opening in the maintop, used in preference to the shrouds by boys and timid climbers. A sailor who rose from the ranks was formerly said to have 'crept through the hawse-holes,' which, pro-

perly speaking, are the holes in the ship's bows through which the cables pass. Murryat, in the *King's Own*, says: 'The kind and considerate captain was aware that a lad who creeps in at the hawse-holes—that is, is promoted from before the mast—was not likely to be favourably received in the midshipmen's mess.' In the army, a man so promoted is called a 'ranker.'

Those amphibious beings the marines, often called 'jollies,' used to represent everything that was contemptible in the eyes of a sailor. A 'marine' and a 'lubber' were synonymous terms. Dana, in his *Two Years before the Mast*, says that on an American vessel 'soger' (soldier) was the worst term of reproach that could be applied to a sailor. 'It signifies,' he says, 'a skulk, a shirk, one who is always trying to get clear of work, and is out of the way, or hanging back, when duty is to be done.' 'Tell that to the marines,' is a relic of that period. 'What the devil has a ship to do with horse's furniture?' cries Sir Bingo in *St Ronan's Well*; 'do you think we belong to the horse-marines?'

They may tell that yarn to the horse-marines,
For we bea'n't such fools as we looks,

sings a recent burlesque writer; but as a matter of fact the value of this fine body of men is now well known and appreciated.

On board ship, 'son of a cook' is a very uncomplimentary epithet; 'swab' is used in much the same way, and is also applied to the epaulet of a naval officer. A lazy man is sometimes said to be 'slack in stays,' a phrase that has no feminine association, but is simply the technical way of saying that a ship is slow in going about. But if a sailor wishes to thoroughly condemn a lazy mean rascal, he brands him as a 'dirty dog and no sailor.'

Various nicknames are given by sailors to one another and to petty officers. The master's assistants have long been known as 'bungs' or 'bung-starters,' because it was part of their duty to stand at the grog-butt and superintend the serving-out of the grog. The skimmings of the coppers in which the fat salt pork is boiled for the crew are called 'slush'; consequently, the ship's cook is dubbed 'slushy'; while his assistant enjoys, with no apparent reason, the name of 'Jack Nasty-face.' 'Nipecheese' is an old and somewhat libellous name for a purser. A 'ship-husband,' according to Admiral Smyth, is the owner's agent; but Murryat applies the term to a sailor very fond of his ship. 'He was,' says that lively writer in *Percival Keene*, 'as we use the term at sea, a regular ship-husband—that is to say, he seldom put his foot on shore; and if he did, he always appeared anxious to get on board again.' Ships trading with the East which are manned by lascars are obliged by the insurance regulations to carry steersmen of some other nationality, usually European or Manilla men, who are known as 'sea-cunnies.' The names common to sailors in general are mostly of shore manufacture. 'Tarpawlin' is the oldest. It occurs in James Howell's *Parley of Beasts* (1660); and six years later, Mr Pepys enters in his *Diary*, October 20: 'He did hope he should not see a tarpawlin have the command of a ship within this twelve months.' 'Tar' is simply a contraction of 'tarpaulin,' and is almost as old a word. Ned Ward in his *London Spy* (1703) speaks of a

'drunken tar, as great in his thoughts as an admiral;' and earlier still, in Durfey's *Commonwealth of Women* (1686), a sailor is spoken of as 'old tarr.' Other well-known names at present in use are 'salt,' 'shell-back,' and sometimes 'lob-scouser.'

The songs popular with sailors are called 'chanterys' or 'shanties.' When a sailor dies, he is said to have 'lost the number of his mess.' Mr Chucks the boatswain remarks to Peter Simple, on an eventful occasion, that he does not think well of the expedition in which they are engaged. 'I have an idea,' he says, 'that some of us will lose the number of our mess.' A better-known phrase with similar meaning is, to go to 'Davy Jones's locker'—that is, the bottom of the sea. The origin of this expression is uncertain. To 'pipe the eye' is to weep; readers of Hood will remember how Ben the carpenter, when he returned to the faithless Sally Brown,

Began to eye his pipe,
And then to pipe his eye.

Litter on deck, sailors call 'raffle'; in American vessels, according to Dana, a confusion of things is, or was, called a 'hurrah's nest, everything on top and nothing at hand.' The converse of this condition is known as 'ship and shape and Bristol fashion,' or more generally nowadays simply 'ship-shape.' To 'haze' is a very expressive word to a sailor; it means to harass or punish by hard and often unnecessary work.

In the old days of privateering, East and West Indianen were wont to make a gallant show of cannon-mouths frowning from their lower port-holes; but as these pieces were all wooden, and not intended to be fired, they were known as 'quakers.' A curious cant name for a ship of war is 'Andrew' or 'Andrew Millar.' Its origin is quite unknown; but it has been pointed out that Antonio, in the *Merchant of Venice*, speaks of one of his vessels as his 'wealthy Andrew'; and it has been conjectured that in this case the ship was named after the celebrated Admiral Andrea Doria, who died in 1560. But to trace any connection between this 'Andrew,' however general the use of the name may have become, and the 'Andrew Millar' of modern sailors' slang would be difficult.

MY VIOLIN.

ART naught but deal, with form and screw and line?
Hast not a soul that answer makes to mine?
Heart speaks to heart—oh, surely mine to thine,
Else, couldst thou thrill as if with thought divine?

Whence come those groans that rend thy throbbing
breast?
Those low sweet tones that fill my soul with rest?
E'en when despair within my heart was guest,
I told thee all, and life again was blest.

Soul or no soul, thou'rt all in life to me;
Scarce dream I dream that is not blent with thee:
Where'er I roam, in sorrow or in glee,
Thou, Violin! a valued friend shalt be.

AT HOME.

How to make it 'sweet home,' that is the question. Not dull, or sour, or bitter, as many homes are, but our 'ain fireside,' the place that has no place like it—this is what we all want it to be.

If one could fly over the house-tops, like the man in the story, and unroof them to peep in, or if a true census could be taken, we should find that for most people 'home, sweet home' is only an abstract idea, not a matter of experience. Leaving unhappy families out of the question, peaceful folks in general consider their home as the place where they do as they like, and get food, rest, and shelter. It never occurs to them that it is sweet. They hanker after a new one, or for some possible change. And several other places seem to be not only like it but much better than it.

We want to get 'home, sweet home' out of the abstract and into the concrete. The popular notion of it, as a vague state of life, is taken from fanciful pictures and verses. These represent home as a holiday house, where the children are making a perpetual rush upon a returning father, and where the family sit in a fireside circle with nothing to do except to share the frugal meal—it is always frugal with the poets. Mrs Hemans is a little more definite in her beautiful lines:

There woman's voice flows forth in song,
Or childhood's tale is told,
Or lips move tunelessly along
Some glorious page of old.

But even this deals only with evening amusement; and it is not always evening any more than it is always May; moreover, the children have to be sent to bed, and the woman 'may sing too often and too long.'

As regards the other descriptions, sometimes there are no little ones, to make welcome with the poet's scramble, sometimes there is nobody to be rushed upon—or at least that pretty scene cannot go on all day. The fireside circle is a bad suggestion when one is eating ice and trying to

get cool; life is not story and song, but is often made of tiring tasks, vexatious details. And lastly, one is not satisfied with the frugal meal, except in print. In fact, the typical description is not able to stand close scrutiny; and hence the ideal home is supposed to be a vague enviable thing, about which common mortals need not trouble themselves. A great mistake; for though the poetic description becomes weak and almost grotesque when looked at closely, it is still in a sense good and true; for it is like the artist's cartoon daubed broadly to give the general colouring; and the general colouring of home is the spirit of love and contentment, which these poor words and symbols of the poets have tried to represent.

As for contentment, in this case it cannot mean the absence of anxiety or of ambition, nor even that what we possess what we hoped for; but only that what we have, we find to be sweet. As for love, it is so much a necessity in home-life, that the very word has come to apply much more to the presence of the people than to the peace shared with them. Change all possessions, and it remains unchanged; transfer the household, and it still is home; but take the circle of our affections away, and everything is gone. The word 'home' has, then, a complex meaning—the dwelling-place, the domestic property and arrangements as a whole, but most of all the united life under one roof. The English-speaking races are proud of this beautiful word; in many other languages the best word to be found instead has a narrower meaning—only 'the house' or 'the hearth.'

Now what is necessary for a happy home? Charles Lamb's suggestion was that there should be in every house a baby rising six months and a kitten rising six weeks. A very nice suggestion too, but slightly impracticable. Kittens have a knack of growing up; and we do not know the shop in fairyland where babies can be purchased *ad lib.* in handboxes. Luckily, the necessities of the ideal home are more within reach than King Baby, who cannot be bought for gold. With a

suitable dwelling-place and prudent management, it is easy enough to solve the problem of how to make home sweet. First as to the house—it ought to be healthy, bright, and sufficiently spacious. Then as to the management—it includes the practice of rule and order and the right use of income. On the important question of income as a factor in the ideal home, we cannot put the matter in a nutshell better than our old friend Mr Micawber did. In one of his conversations, something turns up to the following effect: 'Annual income twenty pounds, annual expenditure nineteen nineteen six—result happiness. Annual income twenty pounds, annual expenditure twenty pounds ought and six—result misery. The blossom is blighted, the leaf is withered, the god of day goes down upon the dreary scene, and—and, in short, you are for ever floored!' A calamity so shocking as Mr Micawber describes must not overtake our ideal home, whatever else happens to it.

Turning next to the character of the home circle, we imagine them to be the ordinary God-fearing and law-abiding folk who form the bulk of the middle classes. The household will be sustained at its best by three simple qualities—virtues in the strict sense of the word, because exercises of strength—home virtues, common things of every day, like necessary water, salt, or bread. These three are good temper, cheerfulness, and energy. The house has been described specially with a view to their preservation. Health, brightness, and sufficient space make it easier to foster these good gifts. The opposite conditions in a house will give the opposite results; the unhealthy home, gloomy and uncomfortable, produces ill-temper, dejection, and languor. But, given the suitable dwelling-place and the sensible management, good temper, cheerfulness, and energy can more easily be cultivated. In a character they rise together, parts of one growth, like the three flowers on a lily stalk.

They are very necessary to enable us to conquer and put out of sight the small vexations of every day; still more needed are they in the critical times of anxiety, the visitations of sorrow, against which no roof can protect, no door can be barred. The knowledge of what life really is—the weariness of daily annoyances, the dread of greater griefs—makes us conscious of a vast difference between the peaceful homes of poetry and romance and the real homes of vicissitude and work. This difference is bridged over by our three household virtues. Mutual good-temper, cheerfulness, and energy are a triple strength, making the family brave in passing trials, and absolutely independent of those trifling troubles that spoil peace and take the poetry out of life.

Cultivating, then, these three splendid qualities, the home circle find in sufficient and interested occupation a healthy appetite for the times of rest and union and amusement. Idleness means discontent, and work apart means joy together. Amusement is necessary to complete home-life. Remember its evenings are to be the safeguard of the young folks from wishing to wander; its innocent gaieties are to be the brightest picture in the children's memory for ever after.

There is one thing, and that perhaps the chief thing, still to be added to our ideal home. The sweetness of it is the sweetness of the woman who

is its reigning spirit. She does more than reign, and she is more to it than a queen to a kingdom. In the 'sweet home' there is always a woman who is its centre and its soul. Everything depends on her. Every one's happiness belongs to her. If she knew her responsibility, it would frighten her; if she found out all her preciousness, it would take her breath away. But there is no trembling, no self-consciousness; she simply remains in her place, like a fair column that upholds an arch, because, though fragile, it is built so truly. The Germans have a beautiful word instead of housekeeper or housewife; they say 'house-mother.' The youngest maid or matron who takes care of the home has earned the title of the house-mother, as if she was the dear owner of everything, and everything looked up to her in return. There is no reason why her happy lot should be felt as a heavy care. What can be a greater triumph to a woman's heart than to have created 'home, sweet home?' And it is woman's privilege to create out of common things and daily life that earthly paradise.

JOHN VALE'S GUARDIAN.

CHAPTER XXXIII.

THE last departed Earl of Barfield had been something of an eccentric and a good deal of a miser, and the new lord was disposed on coming into his estates to strew what the old man had gathered. For years, Barfield Hall had slept with closed eyes in the care of one or two servants on board-wages. Now, its old-fashioned saloons were thrown open again; an army of workmen had invaded the place; and in the course of a four months' occupation, had so far refurbished it that it was hard to recognise. Van-load after van-load of furniture was discharged at its doors; and tons of venerable rubbish were carted away and consigned to a new oblivion. When the old Earl had been twelve months in the family vault, his successor came down with the young Countess and took possession, to the much rejoicing of the local tradespeople, as well as the smaller local magnates, who had long mourned the absence of their natural chieftain.

His young lordship, as it was the fashion to call him, was by this time well into the forties; but he was apparently determined to make the best of such time as was left to him, and went in heartily for all sorts of social entertainment. Dinners, social and political, luncheons ditto and ditto, garden-parties, carpet-dances, ceremonious balls, private theatricals, whatever he could think of for the enlivening of the country-side and the entertainment of his guests, his lordship offered.

Amongst other public posts he held was that of Lieutenant-colonel of the County Yeomanry Cavalry, and with his new scope for generosity, and his native desire to be agreeable to everybody, his lordship took upon himself to hold the annual yeomanry ball in his own house. Hitherto, the ball had been promoted by subscription, and had been held in the local Assembly Rooms, a dingy establishment, given over for the greater part of the year to the uses of a cart and coach builder, and cleared of its stock on one or two occasions only in the whole round of time between January and December.

Snelling was a yeomanry corporal, and received with the rest of the people interested a ticket for himself and a ticket for a lady. He would have offered the latter to Cecilia; but he knew that Shorthouse, as a private of twenty years' standing, would have his tickets also, and that the courtesy would be useless. Members of the troop were of course understood to appear in full parade uniform, and Snelling's clothes having been destroyed with his other belongings in the fire, he was compelled to order new ones. Cecilia was certain to be present; and since Snelling thought rather better of himself in his spurs and scarlet than in any other attire he had the right to wear, he made the life of the tailor to whom he took his instructions a burden. The clothes came to the *Barfield Arms* two days before the date fixed for the ball, and being tried on, and not turning out absolutely to his satisfaction, were taken back again with instructions that they should be altered.

This care about detail threatened for an hour or two to rob Snelling of the ball, for the amended regimentals came home only in the nick of time. Even the fashionable arrivals, who had a prescriptive right to be later than the common people, had put in their appearance when Snelling reached the Hall. He was unaccompanied, meaning to leave himself entirely free to devote his evening to Cecilia. It was not his way to look on anything as hopeless because it had once eluded him, and in point of fact if the prize he sought had fallen at once into his hands, he could never have taught himself to care for it. It was the refusal and the risk which stirred him; and *they* stirred him so deeply, that if he had secured Cecilia now, he would never again have grown indifferent to her.

Almost the first person he encountered was Shorthouse, with a face as red as his tunic. The good man clung heroically to the tunic and waist-belt of five years ago, and refused, in spite of the straining testimony they afforded, to admit that he had grown in girth by a hair's-breadth. Their tight embrace made his breathing a little difficult, and he wheezed at his friend and neighbour in an unaccustomed voice.

'Bob, ode lad, I want a word with you.'

'Two, if you like,' said Snelling, who was in a better humour than common at the thought of a free hour or two in which to prosecute his courtship.

'Come into one of these here corners,' said the farmer, 'and sit down.—Now, listen to what I'm going to say. Bend down a bit; I don't want nobody to overhear.'

Snelling, resting his bushy on his knees, leaned forward with his ear at Shorthouse's lips.

'Art in the same mind thou wast in six months ago?' the elder man asked him.

'As to what?' Snelling queried, turning his face towards him.

'About my gell?' Shorthouse whispered.

'I'm as much of that mind,' Snelling answered gruffly, 'as a man needs to be, if I could see my way towards it.'

'Very well,' said Shorthouse. 'I'm game to lend a helping hand. I'll have no foreign chaps sneaking after a gell o' mine. Her'll marry an Englishman, or her'll stop single.'

'You've seen that, have you?' asked the disappointed suitor.

'Seen it?—yes. I put it to 'Zaiah Winter two months gone by, and he asked me what sort of a maggot I'd got in my head to think of such a thing at all. I've found her to-day with a book I'd never seen afore. I took a look at it, and it turned out to be a Bible. It's done in French and English, and it's got a cover in bone or ivory, or summat o' that sort, with angels and tree-boughs and all sorts of things cut into it. That French chap had gien it to her, and her never said a word to me about it. I said nothin' neither; but I can put two and two together. I've got a father's feelin' for the wench, and somehow her bein' motherless meks me softer with her; but sparked up to by a foreigner her shall not be; I'd sooner see her in her coffin.'

'That's how anybody who knows you,' hummed Snelling in a slow deep murmur, 'would expect to hear you talk.—But what's going to be done in the matter? You can kick him out at any minute, and what he's after is plain enough; but what kicking him out will do for me, I don't see.'

'Bob,' said the elder, 'you've made a sad waste o' time i' that particular. You've niver studied the ways of the petticoats. A gell's "No" counts for nothing. Cecilia's poor mother said "No" to me three times, till at last I went up to her, and I said: "Look here," I said. "Make a hend o' this," I said. "Tek me or leave me." Her took me for better or worse that instant minute; and better it was, for her father farmed the thinnest bit o' land between here and Coldfield; and though I say it as shouldn't, there warnt a likelier chap than me within six mile. The young generation's a bit better; but they was a weedy lot about Hoyden i' my marrying days. A gell's "No" is just a sort o' "Follow me, lad," and that I found out when you was gung about in corduroys and a round jacket.'

Hope began to knock at Snelling's heart again; but he contrived to keep his common aspect of massive self-possession. 'You think,' he asked, 'it's worth my while to speak again?'

'I'll mek it so,' said Shorthouse, 'if I've got any vice i' the matter. I'd sooner lay her cold in her grave than let her wed anybody but an Englishman. I wonder at the young fellow's folly. He says to me one day at 'Zaiah Winter's house, himself: "You're John Bull, you are, inside and out. A John Buller man than you be," he says, "I never see." And yet in spite o' that, it's as plain as the nose on your face as he comes a-courtin' Cecilia.—He's here to-night.'

'What?' Snelling snarled, in a voice which drew half-a-dozen pair of eyes upon him.

'Hush, hush!' the farmer warned him; 'tek it easy, lad—tek it easy. I'll see no mischief comes o' it. They was talkin' together at the other end o' the room when you and me run agen one another.—Don't go yet, Bob; wait a while. I've another word to say to you. You're not quite so young as you used to be, and you've got a bit perhaps too solemn a church-going style about you. Spark up a bit; smarten thyself, ode lad. Why, i' my courtin' days, I'd have a dozen wenches on the giggle afore I'd been five minutes among 'em. They like a merry-

hearted man, Bob. Thee canst tek that for gospel.'

'What brings him here?' said Snelling, who had but little merriment to waste on anybody.

'I don't know,' the farmer answered. 'I found him a-jabberin' away with Sir Ferdinand and Sir Ferdinand's lady; and her ladyship in special piping like a jenny-wren, in his own foreign lingo, and swayin' and laughin' and smilin' at what he said as if he'd been a hemperor. They seem inclined to mek a lot of him; and I ain't one of them as sets himself up against his betters. The young man's all right, I mek no doubt; but "hands off" is my word to him.—Now, Bob, brisk up a bit, get away; you've got my good-will.'

Snelling rose slowly, with a single nod in answer. He looked quite soldierly in his handsome uniform, and was as well set up by nature as most men can be by the exercises of the drill-yard. As he approached the upper end of the ballroom he saw Jousserau in the act of presenting Cecilia to Lady Blacquaire, who took the girl's hand kindly and with no air of patronage. Cecilia bore herself perfectly; but it was evident for all that that she was a trifle scared by immediate contact with so much greatness.

'That's where it is,' said Snelling to himself. 'The silly little thing's got it into her head that because he's friends of a sort with that kind of folks, she will get amongst them too. Her head's a bit turned with the notion, and that's where he gets the advantage over me. She'd never have thought about him if he hadn't come to church in my lord's carriage.'

He dared not intrude himself while Cecilia was with her ladyship; but when once they had parted, he strolled towards her, and made a stiff half-ironic inclination to her in imitation of the manner of his officers and other people of quality. 'This is better than the Assembly Rooms last year,' he said, by way of opening a conversation.

'Very much better,' Cecilia answered. 'It is very kind of his lordship to have the ball held here; but we can't expect him to do it always, and it will spoil us for next year.'

At this instant the county member, in passing, shook hands with Snelling, whose vote and influence were worth conserving, and tapped Jousserau on the shoulder. 'Excuse me, Mr Snelling,' he said; and then to Jousserau in his own language: 'I want to introduce to you a friend of mine, a great admirer of your last picture, by the way. He is an excellent fellow, but—'

All Sir Ferdinand's acquaintances were excellent fellows, and they all had a 'but' to their excellences.

'Shall I find you a seat, Miss Shorthouse?' Snelling asked, when he and Cecilia were thus left to themselves. 'You'll be getting tired if you stand between the dances.'

Cecilia took his proffered arm. He conducted her to a seat and sat down beside her. He wanted to follow Shorthouse's advice and to make himself brighter and livelier; but he could think of nothing to start upon. His rival was in his thoughts, and his unexpected appearance at the ball was irritating. 'I hadn't expected to find our French friend here,' he said. 'What brings

him at a yeomanry ball, I should like to know?'

'I suppose,' returned Cecilia laughingly, 'that none of us would be here if we had not been asked. Mr Jousserau has been telling me that he means to paint pictures of English life. He thinks that a yeomanry ball would make a very brilliant scene for a picture, and I fancy that he is here chiefly to make observations.'

'Well,' returned Snelling, 'that's what I should call as rare a bit of impudence as I ever heard of.'

'Impudence!' said Cecilia, in a tone of astonishment. 'What can you mean, Mr Snelling?'

'I'm a part of this assembly,' he responded, 'and I've an objection to being stared at and took stock of by anybody as wants to make money out o' me without my free gift and permission.'

'Really, Mr Snelling,' said the girl, 'I think you are a little too sensitive.'

'Perhaps so, perhaps not,' he answered. 'Anyway, that's my feeling.'

Cecilia said nothing; and a moment later Shorthouse appeared and took a seat beside his chosen son-in-law. He nudged Snelling with his elbow, and gave him a wink and a nod towards Cecilia, as an intimation to begin to make himself agreeable. Snelling not putting these instructions into immediate practice, the farmer began an elaborate pantomime, clumsily expressive of an invitation to dance. Snelling, fearing lest his companion's motions should be observed by the girl, put an end to them by a nudge of the elbow and a warning frown. He was in the very act of turning to obey the dumb injunction, when the band struck up the first bars of a polka, and there was Jousserau standing before Cecilia. The girl rose, and the two sailed away together in time to the music. Snelling, in blank astonishment, turned on Shorthouse, and he and the farmer stared at each other in a mutual indignation.

'Is that company manners?' Snelling demanded. 'A young lady is sittin' talking with one man, and another comes and whirls her off from under his very nose!'

'I suppose the man had axed her beforehand,' said Shorthouse. 'Why didn't you ax her yourself, when I told you?'

'I was turning round,' Snelling responded angrily, 'when he walked her away from under my very nose. I shall give that young man a piece of my mind.'

'Thee'll help nothing by meking a row here, Bob, my lad,' returned the senior.

'It's not my way to mek rows anywhere,' Snelling answered; 'but I shall give that young man a piece o' my mind, and a good-sized piece into the bargain.' He got up and strode away to the buffet; and there, not caring that his angry face should betray him, he forced an aspect of hilarity, and clapped one or two of his comrades boisterously on the shoulder. Lord Barfield did things liberally, and there was an ample, and even more than ample, supply of champagne. Snelling thought but lightly of that beverage, and altogether underrated its effect. He knew, indeed, very little about it, and had tasted it perhaps half-a-dozen times in his life; but if any man had told him that he could possibly take too much of it for sobriety, he would have laughed the idea to scorn. He was hot and excited, and

one servant or another filling his glass as often as he set it down, he drank more than he knew, and in a surprisingly short space of time the wine was buzzing in his head, and there was an altogether unaccustomed flush upon his face. His deep voice was always louder and more powerful than he fancied, and now it rang out so noisily once or twice that one or two of his comrades warned him.

'I say, corporal, don't make that row; we shall have his lordship here.'

It never entered the man's head that he had been drinking, or that the wild flush of gaiety with sudden flashes of ill-temper was attributable to the wine. Champagne was a beverage for women, and a solid man like himself could surely drink a dozen of it and feel nothing.

Shorthouse was at his elbow, and took him by the wrist as he laid his hand upon a bottle. 'Come back into the ballroom, Bob, and leave that alone.'

'Leave it alone?' Snelling answered. 'What for? Why should I leave it alone?'

'Well, if you want to know,' Shorthouse responded bluffly, 'you've had enough on it. It's beginning to tell on you.'

'What, that stuff?' cried Snelling with a great roaring laugh. 'That's a good un, and no mistake.' He bent in his vinous mirth, clipping his thighs with both hands, laughing obstreperously. 'Why, I could tek a hog'shead of it and never come to harm.'

'You be said, Bob, and come along,' the farmer insisted. 'You've had enough on it.'

But Snelling looked down from his own superior height over Shorthouse's shoulder, and his glance was so intent and wrathful that the farmer turned round to see at what it was directed. Jousserau was standing there, talking to Sir Ferdinand, and in the act of clinking glasses with him. Snelling shouldered his companion out of the way and laid a ponderous hand on the artist's arm. 'I'll thank you,' he said, 'to let me take the liberty of a word with you.'

'Assuredly,' the artist answered, looking up at him.

'What you are,' said Snelling, 'and who you are, I neither know nor care. Parson Heathcote, I'm told, gives you out for a gentleman; but that you're not, and I'd lay my life upon it.'

Jousserau saw his condition at a glance, and he had heard some hint of his proposal to Cecilia. 'Do not let us talk of that,' he said. 'You shall have what opinion you please.—I am engaged.' He turned once more towards Sir Ferdinand, who was staring wrathfully at Snelling.

'Oh, but we will talk about it; I am going to talk about it.'

'I must really beg your pardon, Mr Snelling,' said the county member. 'You may state your opinion elsewhere, but you shall not state it here. Please, understand that.'

'I know you, Sir Ferdinand,' said Snelling, brandishing his arm, 'and I knew your father and your grandfather afore you. I know who you are; but who this chap is I don't know.'

'Captain Hawkes,' said Sir Ferdinand with great smoothness, addressing one of the astonished bystanders, 'I suppose that this person being in military uniform, and you being in uniform also, that he is amenable to your orders. I am not a

military man myself; but I should presume that to be the case. Will you kindly have him taken away somewhere? He is intoxicated, and as you observe, is creating a disturbance.'

'Intoxicated!' shouted Snelling. 'Me? If there's e'er another man here dares to say so, I'll knock him down.'

The gentleman appealed to by Sir Ferdinand made a mere motion of the hand to one or two of the yeomanry troopers, and in an instant half-a-dozen stalwart fellows were about him.

'Come along, Snelling,' said one of them with persuasive good-humour. 'Don't let's have any trouble about it.'

Snelling had not exceeded so far that he had lost all sense of personal dignity. 'I'll have no scuffle,' he said, with unexpected calm. 'I'll take Sir Ferdinand's word for it that I'm not wanted. As for that little jackanapes yonder, I can state my opinion of him at some future time, maybe.' So saying, he saluted his captain and walked from the room steady and erect.

'That's a very unusual condition for Mr Snelling, surely,' said Sir Ferdinand, addressing Shorthouse.

'It's a condition I never see him in afore,' Shorthouse answered. 'The truth is, Sir Ferdinand, the poor fellow's done no fault, but been overtaken in a misfortune. He looked on this here champagne wine like so much ginger pop, and it never entered into his mind to think as it could hurt him. There isn't a more respectable man, Sir Ferdinand, not for twenty mile around.'

An assenting murmur ran about the room.

'Evidently an accident,' said the county member.—'But, Jousserau,' he added in French to his companion, 'what had you done to make the man so angry?'

'My faith!' said Jousserau, 'nothing that I know of, absolutely nothing!'

Snelling, meanwhile was raging across the park, with occasional fierce pauses. 'I'm not fit company,' he said over and over again, 'for a place where that foreign monkey can show himself and be made much of. I've had enough of this. I'll change it. I've been soft and quiet long enough. I'll change it all; I'll find a means to be revenged on that fellow.' He shook his fist madly at the lighted Hall, and turning again, plunged on through the darkness with the actual lust of murder in his heart.

THE REVOLUTION IN TEA.

It is a remarkable fact that the importations of Indian and Ceylon teas into this country are now almost equal in weight to, and are actually greater in money-value than, the importations of China teas. And yet the cultivation of tea in India is an industry scarcely fifty years old, and in Ceylon barely ten years old. Between 1866 and 1886 the exports of China tea doubled; but in the same period the exports of Indian teas increased *fourteen-fold*. The consequences, actual and impending, of this revolution in the trade are causing such serious concern in China, where tea is a staple industry, as well as a leading source of imperial revenue (every pound exported paying to the Treasury a duty equal to about twopence

per pound), that a special investigation into the whole subject was lately ordered by the Tsungli Yamen. Sir Robert Hart, who has charge of the imperial maritime customs of China, has embodied the results of the inquiry in a Report which affords a great deal of interesting information.

It is shown that the decline of Chinese tea in favour is chiefly in Great Britain and America—which latter country, however, takes Japan tea now in preference to both Chinese and Indian—for Russia, the next largest consumer, is increasing its demands, although not sufficiently to make up for the loss of the British markets. And it is also stated that the decline in favour of China teas is not due to any deterioration in the quality of the native leaf, but chiefly to the carelessness with which it is prepared for market. The growing favour of Indian teas, on the other hand, is said not to be due to superior flavour, but to superior strength and greater care in preparation, so that a pound of it goes much further than a pound of the Chinese teas.

It is worth while comparing the systems on which the industry is conducted in the two competing countries, so as to understand how the great revolution in the trade has been accomplished.

In China, tea is grown for the most part in small gardens farmed by those who own them, generally men of little or no capital with which to obtain fertilisers and to renew the plants from time to time. The 'picking' is done by the family of the grower; but in the height of the season extra hands have to be employed. To economise this expense, the picking is pushed forward, and the plucked leaves are allowed to stand until the picking is finished, whereby they suffer greatly in quality. A consequence of this manner of proceeding is that the leaves are not evenly 'withered' when the process of manufacture begins.

In India, on the other hand, the tea is grown in large gardens, sometimes covering thousands of acres, superintended either by the owner himself or by a skilled agent. In the Assam district the gardens are in the alluvial valleys of the large rivers, and many of them are formed of ground reclaimed from the primeval jungle with all the richness of a virgin soil. The plants are grown from selected seeds, and the indigenous plant has been found superior to the China plant which was at first favoured. The labour is all done by coolies, brought from the central provinces at a considerable expense, and the wages are high—for India. But with efficient, although costly, labour the greatest care is practised in cultivation, digging, weeding, &c., and especially in the delicate work of plucking. The exact moment to begin picking is determined by the overseer, and the leaves have to be removed in such a way as to cause no injury to the plant. If a leaf be carefully plucked, another will follow in about a fortnight; but if carelessness be used, the branch may be rendered barren for the rest

of the season. Close and constant supervision by European managers and assistants is thus necessary, and by this means the Indian planters get some sixteen successive pickings in one season; while the Chinese get only four. Moreover, in the Indian gardens, when the leaves are plucked, they are at once started on the course of 'making,' and are not left to lie about, as in China; so there is no deterioration.

Each picking of a garden is in India called a 'break,' and in China a 'chop.' But an Indian 'break' is rarely above a hundred chests, and is often only twenty, and it is absolutely even in quality throughout; whereas a Chinese 'chop' may be run up to several hundred chests or half-chests, purporting to be of even quality, but made up of many pickings from different gardens, producing a mixture which is not uniform, at the expense of the deterioration of the better leaves.

In India, each day's picking is immediately 'withered,' and when perfectly and evenly withered, is 'rolled' lightly by a machine. In China, the withered or partially withered leaves are put into small cotton bags, loosely tied, and placed in open wooden boxes, the sides of which are pierced with numerous holes. A man then gets into the box and presses and kneads the bags with his feet, with the object of both rolling the leaves and expressing the moisture.

Next comes 'fermentation.' In India, this is done in the open air, without any extraneous aid; and it is part of the skill of the planter to know the exact moment when to arrest the process, for immediately the proper point is reached, the tea must be 'fired.' In China, after the jumping process above described, the tea is placed in baskets and covered up with cotton or felt mats, so as to retain the heat and hasten the fermentation. After it has stood thus covered up for a certain time, it is taken out and 'fired.' This firing is one of the most important of all the processes, and requires great skill and care. The Indian planter is most particular to see that only the very best hardwood charcoal is used, and that the tea is so constantly turned over that there is no chance of any of it getting burned. A single basket of burnt leaf will spoil a whole 'break.' In China they often make the tea 'smoky' by using ill-made charcoal, and sometimes 'tarry' by firing with soft woods like fir and pine. The 'tarry' flavour, it is said, will often not develop until long after the tea has left China, and some waters bring it out more disagreeably than others.

The following is or should be the process of 'firing' by the charcoal system. After the fire is ready, a tubular basket, narrow at the middle and wide at both ends, is placed over it, and into this tube a sieve is dropped, covered with tea-leaves, shaken on it to about an inch in thickness. The leaves have to be carefully watched while the sieve is over the fire; and after about five or six minutes, they are removed and rolled. As the balls of leaves come out of the hands of the roller, they are placed in a heap on the floor; and when all have been thus manipulated, they are shaken on to the sieves again and set over the fire for a few minutes longer. They may even sometimes be rolled and fired a third time until the leaves have assumed the right dark colour. When the whole batch has been thus treated, it is placed thickly in the baskets and again put over the fire.

The attendant makes a hole with his hand through the centre of the mass, so as to allow vent to the heat as well as to any smoke or vapour from the charcoal, and he then covers it over with a flat basket. The heat of the fire is now reduced, and the tea is allowed to remain over it until perfectly dry. It has to be constantly watched and frequently stirred to ensure equal heating. When the firing is done, the black colour of black tea should be well established, although it afterwards improves in appearance. The tea is then winnowed and sifted through various sieves to divide it into the different kinds.

In India, however, another process for firing tea has been introduced of late years. It is called a 'Sirocco,' and is a machine for applying hot air, which is superseding the charcoal process. It is rapid in its work, and is said to be superior in many ways. The leaf is laid out on wire-gauze trays, which are passed through the hot-air machine at a temperature of three hundred degrees, and in from fifteen to twenty minutes the tea is thoroughly fired. It is then placed in the 'sifters,' which are worked by machinery with either a lateral or rotatory motion, and the different grades are sifted out, such as Dust, Broken Pekoe, and Pekoe. The larger and coarser leaves which do not pass through the sieves are cut to an even size and classed as Pekoe Souchoing.

The Hankow Commissioner of Customs declares that the method practised in China of rolling and squeezing the leaves before fermentation goes a long way to account for the large quantities of inferior teas which are sent into the market—of good leaf spoiled.

The weakest part of the Chinese system, however, seems to be in getting it to market. In India, everything is done in the garden, from the picking to the packing ready for shipment in properly branded 'breaks.' But in China, the grower does not prepare the tea for market; he brings it up to a certain stage, and an intermediary 'tea-man' has to complete the work at his convenience. Thus the tea is often long exposed to the influence of the weather before it gets into the lead-lined chests. The 'tea-man' lives mostly in Hankow, Shanghai, or Canton; and about March or April he starts up-country well supplied with copper 'cash.' At some suitable point for shipment he has a central 'hong' or factory, and 'godown' or warehouse. Thence he despatches his agents in all directions; and they scatter sub-agents all through the tea-districts to collect the leaf from the growers. It is gradually brought in to the 'hong' in bags, and may be for days on the road, exposed to the weather thus imperfectly covered. When enough is collected at the 'hong,' the tea-man proceeds to pick and refine it. By means of a revolving sieve, the larger leaves and the smaller are separated; then come mixing and blending, so as to produce an average appearance for different 'chops'; and then it is packed for market.

One of the complaints is, that this packing is very carelessly and roughly done in China, to the further injury of the delicate leaf. The coolies are said to tread it into the boxes with their feet—not always bare—with a total lack of discrimination, and with such amount of pressure as to produce a large proportion of Dust. The Commissioner at Wuhu reports: 'Instead of the

tea being packed carefully, it is rammed down hard, and is put into the chests while still hot. Hastily packed and heavily pressed down, the tea cannot possibly escape injury; and being put in and covered over while hot, it becomes damp when it gets cold. While hot, the tea is very brittle, and gets broken very easily, yielding in consequence a large percentage of Dust. The object of packing the tea while hot is to enable it to retain its aroma, so that when the chests are opened there may be a fragrant odour emitted. The aroma is there, no doubt, but at the expense of the tea, which suffers in consequence. The tea after being fired and packed is conveyed part of the way in wheelbarrows and part of the way by boat. It is handled roughly *en route*, and being protected by a few mats only—and these hastily thrown together—it gets wet. No notice, perhaps, is taken of this circumstance, and hence the tea gets ruined.'

Shanghai merchants complain of the quality of the teas manufactured in Ningpo district under the name of Pingsueys. Some of the dealers, they say, do honourably make and supply pure tea; but the majority mix 'spurious rubbish' with the good leaf, and colour it to look like the genuine article. One of the least harmful forms of adulteration is tea-powder mixed with congee and rolled into pillules, to sell as 'Gunpowder'; but in many cases all sorts of foreign and even injurious substances are introduced.

In Foochow, we find the European merchants complaining of the frauds of 'tea-men' selling a 'chop' of inferior stuff by a false sample of good quality. But a more serious matter, as more difficult of detection, is the large admixture of what is well called 'Lie Tea'—that is to say, leaves other than tea-leaves—and the employment of Congee or rice-water, tea-dust, soot, and other deleterious substances, in the manufacture of locally packed teas. Even the expert is often unable to discover the presence of 'Lie Tea' in the finer grades, so cleverly is the fraud manipulated.

To come back to India: we find a very different system in vogue. The moment the tea is ready, it is packed—loosely, and never pressed, but shaken down—in strong air-tight boxes and shut up at once from atmospheric influences. No leaves are broken in the packing, and no Dust is made in the chest; indeed, many planters pass the tea carefully through a sieve before packing, so as to remove whatever Dust may have formed in the previous processes. Every chest is honestly and faithfully what it professes to be, and every box in a 'break' is precisely the same as the rest of the 'break.'

Here, then, we have the secret of the decline in favour of China teas, and the rapid ascent of Indian teas, in our markets, where sterling quality is so quickly appreciated. In India, a single garden will contain thousands of shrubs, the products of which are picked, withered, rolled, fired, packed, and despatched in one spot and under one watchful, experienced, and faithful supervision. Unremitting attention is given to every stage of the process, and the tea comes into the London market as it left the gardens in the valleys of Assam and on the hills of Cachar or Neilgherry. One profit suffices for grower, manufacturer, and shipper, and thus expenses are minimised, and genuine first-class tea is placed before

the British consumer at a low cost. In China, everything is the reverse, and although labour is cheaper there, there are so many profits to intermediaries, so much handling and such taxation, that the ultimate cost is something like threepence per pound more than the Indian rival, which goes a great deal further.

These facts are instructive, as illustrating how a great nation may lose a great industry by carelessness and dishonesty, and how a few energetic and honest traders may build up in a short time an enormous traffic. It is natural and proper that our sympathies should be with the triumph of our Indian industry.

MRS LAMSHED'S WILL.

CHAPTER II.

WHEN Kate came down-stairs she found Mr Dottleson in a frame of mind very different from that in which he had spent the earlier part of the afternoon; the storm had subsided in cloudy gloom. Papa had evidently something on his mind, and she busied herself to rouse him.

'Shall we go out after tea, papa?' she began. 'Grandmamma's asleep and the rain has stopped.'

'I'm afraid I have annoyed your grandmother, Kate,' replied Mr Dottleson sorrowfully; 'but really I felt bound to speak to her as I did for your sake.'

'She was rather hurt at what you said; but you can easily make that all right.'

'How?'

'Oh, you might ask Dr Lakeworth to dinner, and make a good deal of him before granny; she would soon forget anything you said to-day.'

'I'll think about it,' said her father, who had decided to act upon his daughter's proposition the moment it was made. 'Your idea is a very good one. It wouldn't do to offend your grandmother; eh, Kate?'

'Dr Lakeworth is a weakness of hers, you know, papa. It's a regular case of love me love my dog.'

'Then next time the dog comes to see her, we'll ask him to stay to dinner with us,' he replied more good-humouredly.

'He is to call on Tuesday afternoon,' said Kate, who saw the chance of doing a little stroke of business on her own account.

'Very well. I'll be here, and invite him myself.'

When Mr Dottleson announced his intention of asking personally for the pleasure of any one's company at dinner, it signified that he intended special honour to the favoured guest; it went against the grain to confer such distinction upon Dr Lakeworth, but circumstances made it advisable.

He came home from the City half an hour earlier than usual on Tuesday, that he might make sure of meeting the doctor, and actually took upon himself to instruct the butler about the wine, a thing he had never been known to do since the memorable occasion upon which the ex-private secretary of an ex-viceroy of India came to dine with him.

The entertainment was a success from every one's point of view. Mr Dottleson was in high

spirits that day; and as Dr Lakeworth was fully alive to the importance of ingratiating himself with his host, he applied himself to the task with great assiduity. He listened to him with such deference, and received his loudly expressed opinions with such respectful attention, that Mr Dottleson's overweening vanity was gratified, and he reproached himself for the injustice he had done the man. 'He seems a very gentlemanly, well-mannered young fellow,' he mused as they went up-stairs. 'Perhaps, I have really been mistaken in him. Anyhow, I will put matters right with Mrs Lamshed at once. I will give Dr Lakeworth my photograph.'

The fortunate being to whom our friend presented his photograph was expected by the original to bear himself thenceforth as became one who had been distinguished above his fellow-men by an exceptional mark of Mr Dottleson's approbation.

'I had a new photo. taken a week or two ago, doctor,' he said blandly, interrupting the guest's conversation with his daughter. 'If you will come over here, I will show it to you.'

'If papa gives you one, speak to him to-night,' whispered Kate hurriedly, seizing the opportunity with the promptness of true generalship.

Charles Lakeworth gave a nod of intelligence, and followed his host to the end of the room, where he was detained for fifteen minutes criticising Mr Dottleson's uninteresting person as delineated in nine different attitudes more or less constrained.

'I shall be very happy if you care to select one,' he said patronisingly to the victim when the ordeal was over.

Dr Lakeworth's gratitude was sincere, in view of the opening which the presentation indicated as before him. He took pains to select the most flattering portrait, and finally won Mr Dottleson's heart by begging him to inscribe his autograph upon it. His request was so graciously complied with, that almost before the ink had had time to dry he had disclosed his halting tale of love. It was listened to gravely, but not unkindly. Mr Dottleson's blindness was being lifted from him; this young doctor was in love with his daughter, and frankly admitted that he regarded Mrs Lamshed's calls for his services only as a means of his communication with Kate. Mr Dottleson could hardly believe it; but he recalled his mother-in-law's remark, and felt suddenly reassured regarding the object of the young doctor's attention to her. No doubt he might have some other end in view; but it seemed clear that Kate was the primary attraction. So relieved was he at the discovery, that for the moment he lost sight of the fact that the suitor was a struggling professional man, who had in all probability never owned a bank account, and he did not give the point-blank refusal he would have done at any other time. He hesitated, and took refuge in a promise to consider the matter. Kate was young, and he believed Dr Lakeworth was also young. He could give no definite answer now; he must think it over; meantime, he should be glad to see him whenever he cared to look in, though he must not regard the invitation as in anyway foreshadowing consent.

It was not much for the most sanguine lover to build upon; but Charles Lakeworth, who had

never dared hope for anything but a positive refusal, was more than content with the answer.

Alas, poor human nature! A slight lapse of memory hopelessly wrecked all the good work of the evening. Charles was so completely absorbed in Kate Dottleson's society that he quite forgot everything else; and when he bade the family good-night, on the best of terms with everybody and his host in particular, he left that gentleman's photograph behind on the sofa, where he had spent the greater part of the time after dinner. There it lay unnoticed until Mr Dottleson, casting a look round the room before he turned out the gas for the night, discovered the neglected honour sticking ignominiously between the cushions. He raised his eyebrows in veritable astonishment as he picked it up. That such a gift from himself should be forgotten thus was almost incomprehensible; but surprise soon gave place to indignation, which he strove unsuccessfully to smother.

'He didn't want it,' he said to himself, throwing the picture into a dish; 'but he might at least have had the grace to take it away with him, after asking me to write my name upon it. I shall be very careful to whom I give my photograph again; that's all.'

Mr Dottleson was not the man to forget the slight he had received at Charles Lakeworth's hands; and the incident narrated above was no small factor in helping him to come to the decision he did when, next morning, he remembered the young man's avowal of love for Kate. He would not admit even to himself that such a thing weighed a single grain in his disfavour; but it is doubtful whether he would have dismissed the subject from his thoughts with a contemptuous 'impossible,' had his guest held the ground he had gained by treasuring that photograph as it deserved. The good impression his would-be son-in-law had made upon him had been more than obliterated by the unlucky forgetfulness which had wounded Mr Dottleson on his tenderest point—his vanity. He recollected with annoyance that he had given this presumptuous suitor permission to come to the house when he pleased, and had thus placed himself in a somewhat delicate position. Had it been any one else, he would have had no hesitation in informing him at once that he had considered his proposal and found it impossible to give his sanction, and, if necessary, directed him to cease visiting at his house. But, in his own interests, he could not deal so summarily with Dr Lakeworth. Mrs Lamshed's feelings, or, to be strictly accurate, Mrs Lamshed's money, had to be taken into account. To close the door in the face of 'her doctor,' as she called him, might put an end to his intercourse with Kate; but the step would certainly bring about the fulfilment of that half-made threat of a 'codicil,' and that was a contingency which must never be permitted to arise. It was no consolation to Mr Dottleson to discover that his action in asking his *bête noire* to dinner had effected its object in conciliating his mother-in-law, particularly when he found that she regarded it as a formal installation of her favourite as a prospective kinsman. She now looked upon Dr Lakeworth's engagement to Kate as a settled thing, which the course of time would bring to a satisfactory conclusion; and so warmly did

she express her approval of the match, that Mr Dottleson felt reluctantly compelled to be silent as to the views he held on the subject. If he declared his intention of opposing the young people's wishes, his mother-in-law would join issue with them against him; and although she held very decided opinions on the duty of a child to a parent, the fact was by no means a sufficient guarantee to satisfy Mr Dottleson that she would not substitute Kate's name for his own in her will, and thus render her independent of him. That would undoubtedly be preferable to the realisation of his previous fears; but it was an alternative he did not relish. He would treat his only daughter liberally if she married with his approval; but he was more ambitious for her than she was for herself, and there was little chance of their agreeing as to Charles Lakeworth's qualifications.

Mr Dottleson considered the case in all its bearings, and made up his mind that for the present his safest policy would be one of complete neutrality, while he watched for a suitable opportunity to join in the game himself. He had been a little at a loss to know how he had best receive the application Dr Lakeworth was sure to make for the pictorial 'mark of esteem' which he had treated so negligently, and was almost relieved when a week passed and he heard nothing about it. The young man had called the day after he dined at Blakewood Square to recover possession of the photograph; but learnt with some dismay that no one had seen it. He was a modest unassuming individual himself, and whilst quite aware that his neglect could hardly be gratifying to Mr Dottleson, he did not anticipate that it would give such grave offence as Kate appeared to think was inevitable.

'Papa will never forgive you for that,' she said. 'But perhaps he doesn't know you left it here. He would have been sure to mention it had he found it, and he hasn't said a word to me.'

Consultation with Mrs Lamshed determined them to let the matter drop; and Mr Dottleson was thus allowed to suppose that his guest had utterly forgotten the distinction he had received. It was a trifle in itself, but it gave Kate's father the feeling that his authority was being left on one side and himself ignored. It was dangerous for any one who desired Mr Dottleson's friendship to tamper with his self-love.

It was not long before he saw a chance of making the first move towards ousting Dr Lakeworth, and he did not fail to take advantage of it. Almost for the first time in her life, Mrs Lamshed was attacked by a violent cold, which settled upon her chest and defied all efforts to dislodge it. Charles Lakeworth came in every day, and no doubt did his best for her, but, as doctors frequently find, he had to contend with the patient, as well as the malady.

'I never have been ill,' said the obstinate old lady irrationally, 'and I'm not going to begin at my time of life.—No; I won't go to bed, Lakeworth. This drawing-room is warmer than my room, and I'm going to stay here.'

So Mrs Lamshed remained in the drawing-room shivering and coughing, whilst Kate and her maid added their entreaties to those of the doctor; but they made no impression upon her; and at last Mr Dottleson was appealed to, to use his influence.

When he understood the condition of affairs, he looked grave, and going down-stairs, shut himself up in the library, where he worked out his project before the mirror to his own satisfaction. 'Now, it's your obvious duty,' said he to himself, 'to put Mrs Lamshed's case in the hands of some one you can trust. You can't honestly say you trust young Lakeworth, for she won't obey him; so you must summon a medical man in whom you have perfect reliance. Now, Dottleson, it won't do to send round the corner for Penkwiss or Musper; you must study the old lady's peculiarities and trade upon them. If she's got a weakness it's the Peerage; and if you mean to undermine young Lakeworth's position, you must shut your eyes to the expense' (Mr Dottleson gulped down his feelings at this point), 'and get some swell physician. Sir Alfred Blodget is your man; he has his finger on the pulses of half the nobility; and if he will come here and talk to her about his illustrious patients and compare her case with theirs, she will take kindly to him. And once I get young Lakeworth away from her bedside, I'll make short work of his philandering with Kate.'

Thus Mr Dottleson reasoned and resolved. It was a costly experiment; but the danger of letting Mrs Lamshed think he wanted to get rid of Dr Lakeworth must be avoided, if possible. She could not but be flattered by a visit from such a man as Sir Alfred Blodget, and her son-in-law was right in believing that her weakness for the Peerage would predispose her to receive him favourably.

'The bill will be something awful,' sighed Mr Dottleson as he closed his letter to the great man; 'but I look upon it as a premium of insurance for the preservation of her will—I mean her life,' he hastily amended.

Mrs Lamshed frowned darkly when he told her what he had done; and it required all his powers of diplomacy to avert a storm. 'I don't want to see another doctor, Montague,' she said pettishly. 'I've told you times without number that Lakeworth is good enough for me.'

'My dear madam, I don't mean to asperse Dr Lakeworth's professional abilities; in proof of this, I have not sent for an ordinary practitioner.'

'Who is it, then?'

'My anxiety has been so great during the past few days, that I am going to ask you to allow Sir Alfred Blodget to see you when he calls; just to relieve my mind.'

Mrs Lamshed's wrinkled countenance grew calmer at the name of the new doctor, and the sagacious Dottleson followed up his advantage at once.

'He will be in to-morrow. I have no doubt that he will take your case on his way from Marlborough House, where I understand he is now in daily attendance.'

The vision conjured up by this adroit remark had an immediate effect upon Mrs Lamshed. She soared lightly to the social attitude of Sir Alfred's august *cliente*, and expressed a hope that there was nothing infectious at Marlborough House.

'Nothing at all—nothing at all,' responded Mr Dottleson easily. 'The—ah, the Princess has been confined to her room with a severe cough or something: I observed it in the *Pot* this morning.'

Mrs Lamshed lay back upon the sofa cushions, and the ghost of a smile flitted across her face. There was something very soothing in the thought that the same doctor was to prescribe for the same malady both for the Princess and herself. A little fellow-feeling with Royalty made the old lady wondrous kind, and Mr Dottleson saw that his point was gained. He did not make any attempt to further his plans just now.

'Slowly and surely, Montague, my boy,' he said pleasantly to himself as he went down-stairs. 'You've got in the thin end of the wedge, and you must drive it home gently, now you have made such a capital beginning.'

Perhaps, if Mr Dottleson could have heard what passed between his mother-in-law and daughter, five minutes after he had left them, he would not have looked quite so complacently on his beginning.

'It's really very kind and thoughtful of your father, Kate,' said Mrs Lamshed. 'Such a splendid opportunity as it will be for Charley!'

'Yes, granny. Why, if it becomes known that he has been in consultation with one of the Court physicians, his fortune will be made; he will be sent for by everybody after that.' Kate was rather sanguine, but then she was in love, and that quite accounted for it.

It is hardly necessary to say that Mr Dottleson had not been influenced by any desire to give Dr Lakeworth such an auspicious opening; the view his mother-in-law took with Kate had never presented itself to him, or the thirty-guinea visit he had requested Sir Alfred Blodget to pay would have seemed an extravagance worse than unnecessary. In fact, it was dawning upon him that he had hooked a fish which might prove unmanageable and be more costly than he calculated on. Suppose Mrs Lamshed made the inconvenient discovery that this new attendant understood her constitution, and encouraged regular visits at the rate of, say, ten guineas for each! She would pay for all subsequent attention, as a matter of course; but the expense would indirectly fall upon him. However, it was no use being frightened by shadows, and he consoled himself with the thought that he had taken the first step towards ridding the house of Charles Lakeworth, happily oblivious of the schemes which the ladies were planning up-stairs.

Sir Alfred Blodget, who had once been aptly described by an incipient page to his mistress as 'a short thick pusson with a square head,' came to see Mrs Lamshed the next day, and commenced his reign by sending his patient to bed, with injunctions to remain there until he called at noon the day afterwards. The old lady submitted meekly; and her first act, when the doctor's directions had been complied with, was to dictate a letter to Charles Lakeworth enjoining him to be present to-morrow that he might meet the great man 'in consultation.' Unfortunately, the servant who was entrusted with the note met Mr Dottleson just outside the hall door, and had to disclose to him the nature of her errand.

'Were you told to take this by hand, instead of posting it in the ordinary way?' he asked as he took the letter and glanced at the address.

'Yes, sir.' Mrs Lamshed particularly said I was to take it myself,' replied the maid.

'Mrs Lamshed said so?'

'Yes, sir. Miss Dottleless wrote it for her.'
'You may tell your mistress that I undertook to leave the note at Dr Lakeworth's.'
The woman surrendered the letter, and returned to the house.

THE TYLT-YARD GUARD.

As may be inferred from its title, the Tylt-yard Guard is one of the longest-established military guards now existing in the metropolis. In addition to the duty of protecting the buildings known as the Horse Guards, the party, by virtue of its designation, acts as a memento of the Tylt-yard which occupied a portion of the site of these buildings in the reign of Henry VIII. That yard was, of course, in near proximity to the palace of Whitehall; and there is still a court, surrounded by various military offices, called the Tylt-yard, as may be ascertained by a glance—when the sentinel's back is turned—at the inscription in a sentry-box standing there. This court is situated between the guardroom and Whitehall, and perhaps includes part of the surface of the ancient Tylt-yard.

The Tylt-yard Guard 'falls in' along with the other 'duties' about ten o'clock in the forenoon of 'guard-day.' At the time of the alignment of the various guards, passers-by in adjacent streets may hear the sergeant-major, with an extraordinary expenditure of lung-power, 'dressing' the duties, and employing a formula which has been used from time immemorial, and is much as follows: 'Steady the Queen's; Back Buckingham Palace; Forward the Tylt; Up Kensington!' When the large body of men has been accurately dressed and otherwise got into proper order, the colours are brought up by a colour-sergeant, escorted by two private soldiers, the gravity of whose demeanour clearly shows how important they consider this service. At a given signal the non-commissioned officer places the flag in the hands of a young officer in the centre of the line, arms are 'presented,' and the drums beat the 'salute,' while any men standing about in distant parts of the parade-ground instantly come to 'attention' and take off their forage caps. The captain of the guard then utters the words of command which put all the duties in motion, to the gratification of the crowd without the barrack gates.

When they have passed through these gates, the different guards pursue the nearest way to their destinations, and at once come under the command of their respective officers. The commandant of the 'Tylt' gives the word to 'slope' arms, and thus notifies his presence; for the men, looking 'straight to their front,' have scarcely as yet seen him. A little farther on, arms are 'changed,' the rigid adherence to one attitude becoming irksome if the distance to be traversed is considerable. When at length within sight of the well-known archway of the Horse Guards, arms are changed again; and the sentry of the 'old' guard is seen hastening to the guardroom door to get his party 'turned out.'

After the usual formalities of salutation on the parts of the 'old' and 'new' guards have been gone through, the officer of the former hands over the keys to his relieving comrade; while the ser-

geants enter the guardroom and earnestly consider the 'deficiencies'—so many buttons are wanting on certain watchcoats, an 'Order Board' in one of the sentry-boxes is slightly defaced, or a dinner-plate has been broken in the 'cookhouse.' Meantime, the men of the new guard are indulging, though in suppressed tones, in a little banter with the party about to 'dismount;' or, more probably, they appear to be in deep thought as they stand 'at ease.' They are speculating as to how the sergeant will 'number them off.' This is to them a matter of solicitude, as some numbers will ensure their bearers a fair amount of sleep during the ensuing night, others will deprive the men of any fairly lengthened period of repose. After a brief interval, the sergeants come forth from the guardroom and join their respective parties. The numbering is accomplished; the 'first relief' being marched off to supplant the sentries belonging to the old guard. About this time, also, two soldiers appear on the farther margin of the Horse Guards Parade, carrying 'shoulder-high' a large iron-bound chest, painted blue, and bearing on its sides in white characters the name of a battalion of the Foot Guards. These men are the cooks, and the peculiar-looking chest contains provisions. Beside them marches a corporal, having under either arm a bearskin-cap case, evidently filled to its utmost capacity with some matter. On inspection, the well-packed matter would be found to consist of tea, sugar, or bars of salt.

Before long, the old guard in its entirety is marshalled under its officer, and straightway marches 'home;' while the party we are chiefly concerned with enters the guardroom. This is one of the older London guardrooms—it is probably in precisely the same condition as when the Great Duke was a familiar figure within the precincts of the Horse Guards. One peculiarity of the older apartments of this kind is, that the sergeant is provided with a table and seat on a raised platform or dais, where he does his writing and discusses his dinner, which latter he thus partakes of in a species of regal state. In the case of the Tylt, his isolation is somewhat augmented, owing to the fact that there is no proper access to the dais—it is only reached by walking over a portion of the guard-bed, often encumbered by the figures of recumbent soldiers. The other features of the guardroom are very much of the conventional sort: pegs whereupon to suspend the knapsacks, a rifle 'rack' with numbered spaces, and of course the printed 'Orders' for the guard. Here, too, is hung up in a conspicuous position a case containing a selection of photographs of the cabinet pattern. They comprise the members of the royal family, and a civilian might wonder why they are placed in a guardroom. The reason simply is, that the younger soldiers may recognise the persons represented, so as to salute them if they should pass their 'posts.' Not far distant from the apartment we have been dealing with is the officer's guardroom. But, unlike his subordinates, the commandant is not compelled to pass all his time with his guard: he may proceed to the clubs in Pall Mall, or call for his brother-officers 'on Queen's.' In the evening he is a member of the well-known mess dinner at St James's Palace; but has to return to the Tylt in time to go 'rounds' at eleven o'clock. Thereafter, the officer

may retire to bed in orthodox fashion; he is not forbidden, like the men, to 'remove his belts' while 'on guard.' Though the guard is always required to 'turn out' to the Bank Picket on its homeward march in the early morning, the officer is not disturbed until the arrival of his servant with a portmanteau from barracks, and is invisible to his 'command' till the time for 'dismounting.'

While waiting for their turn of 'sentry-go' in the large guardroom, the men employ themselves in various ways. Some read, and all thoroughly reblacken their boots, which have lost their lustre on the march from barracks. If the weather becomes wet and greatcoats are ordered to be put on, careful guardsmen divest themselves of their tunics and replace them by old and discoloured ones, which they extract from their knapsacks. But they have to do this quickly. As already hinted, there is a very stringent paragraph on the 'Order Board' to the effect that 'no man is to remove his belts while on guard;' and any delay will inevitably be observed by the vigilant sergeant from his elevated seat.

Soon after 'mounting,' a fanfare of trumpets causes a flutter in the guardroom, most of the men quickly seizing their rifles and moving towards the entrance, where they are met by a vociferous cry of 'Guard, turn out!' by the sentinel. When formed up outside, the soldiers see the cavalry guard approaching. This is 'found' by the household cavalry, and takes up its quarters in another wing of the Horse Guards, where stabling and other requisites for horsemen are provided. The well-known 'statuesque' mounted sentries posted in Whitehall belong to this guard, whose duty, of course, is quite distinct from that of the Tylt.

By the Tylt, five sentries are furnished in and near the Horse Guards; and it cannot be said that their functions materially differ from those of other metropolitan sentinels. One of them is posted at the guardroom door. An important part of his duty is to 'turn out' the guard to the mounted party above alluded to, as well as to the picket on its way to and from the Bank of England. Another sentry is placed in the Tylt-yard; and a third in Whitehall. The latter has a pretty long patrol. He is occasionally annoyed, on turning about, to see urchins perusing the instructions in his box; but by assuming a threatening cast of countenance he easily scares away such curious persons. The two remaining men are stationed in front of public offices. Their posts are quiet and retired; they have, however, to keep a 'sharp lookout' for the notabilities who enter these buildings, and who in certain cases require to be saluted. In addition to performing sentry-duty, the private soldiers have, two at a time, to escort the sergeant when he goes 'on patrols;' and two of them—who are exempted from patrols—accompany the officer in his 'rounds.' About a quarter to eleven, the drummer may be seen to adjust his bearskin, making his way towards the cookhouse. Here he lights the gas and opens the blue, iron-bound chest, in the bottom of which he finds a candle. Returning to the guardroom, he cuts the candle in two, placing one moiety in a lantern, and the other in the fire, which he thereby improves with an eye to the coffee or cocoa which will shortly be prepared. The hoarse challenge

of the sentry outside is now heard, and the reply, 'Friend,' is uttered by the officer, who has returned from the 'Queen's.' Then the sergeant demands the men 'for rounds;' and he himself, a corporal, the two soldiers already noticed, together with the drummer and lantern, proceed to the various 'posts' with the officer. And when the rounds get back to the guardroom, the principal event of the night is over.

In the morning the men who are reposing on the guard-bed are disturbed by the drummer-boy attached to the Bank Picket. He has hastened a little in advance of the main body of the picket to the Brigade Office, where he has left the 'report.' Passing through the Tylt, he announces that the 'Bank' is approaching, and then waits on the Horse Guards Parade till his party arrives. Thus forewarned, the guard is turned out in good time, and 'presents' arms to the picket, whose members look somewhat fatigued by their considerable march from the City. Just as the guard is being 'turned in,' the corporal of the cooks with his two men are seen advancing across the parade. They each carry a bearskin-cup case, containing, not a bearskin, but several small loaves of bread. And about half an hour later comes the officer's servant with a portmanteau. This functionary, after a short interval of gossip in the guardroom, begins to make preparations for his master to 'go off.'

While the members of the guard are making ready to dismount, or 'go off,' great activity prevails. The floor of the guardroom is well scrubbed, these daily scrubblings giving it a furrowed appearance, so that the boards almost look like a tract of hilly country as represented in the models used for the 'war-game.' And when they have completed their preparations, the men anxiously await the stentorian call of 'Guard, turn out!' which will inform them that their vigil is at an end.

HOSPITAL-WORK ON FRESH LINES.

HOSPITALS, their claims, their difficulties, and their drawbacks, have been brought from time to time before the notice of our readers, and we now propose giving some account of a new departure both as regards aims and management.

Those acquainted with the wards of an ordinary hospital know only too well how often a case lingers on, in unsatisfactory lack of progress. It has been an accident, perhaps, and the patient has recovered up to a certain point; but now no advance is being made; and when all remedies have been tried in vain, the unfortunate sufferer has to make way for more hopeful cases.

'Can nothing more be done for Mary Blake?' we inquired of a surgical friend, who had reluctantly given the child's parents notice that she must be removed.

'Nothing, under present conditions. If we could operate again it might mean a cure, but the general health is too bad. The fact is she wants months of country-life and fresh air to give her the chance of pulling round after an operation.'

'This she cannot have at home, of course; but could she not be got into a Convalescent Home?'

'No Home I know of would take such a case.'

She needs regular surgical nursing, and this is not provided at Convalescent Homes.

And poor little Mary, languishing on her bed of pain in her one-room home until death came with happy release, is but a sample of thousands who, in all our crowded cities, are hopeless of cure, for lack of Nature's healing gifts, denied to her town-bred children.

With a view to meeting such cases, an experiment in hospitals has been set on foot for the benefit of London children; and it was our recent privilege to visit the charming little hospital known by the modest name of Heathbourne Cottage. 'Only eleven miles from Hyde Park Corner,' we are told; and we quite agree that 'it might be a hundred.' Indeed, so rural is the place, that having come without instructions, our Jchu finds it a question of patience to fall in with a passer-by; but as we draw up at a long low house, standing back from the road, all doubt is set at rest by an eager little white face, which has evidently caught sight of the stranger, and is conveying the news to companions in the distance.

A kindly greeting awaits us from the presiding genius, a lady who has undertaken the work as a labour of love, and who, with a 'chum' friend, sees practically to the welfare of her flock. We sit down for a few minutes in 'Sister's' pretty parlour, and enjoy a chat which shows how truly work may be its own reward, and as we sit, the low French-windows reveal a little group busily at work weeding.

'Why, they might almost be working for a living,' we remark.

'Oh, they are doing more than that,' says Sister with a smile; 'they are working for a slice of cake! Master Johnnie, who is the eldest of my convalescents, has got into the habit of being lazy, and I am trying to work him into brighter ways, now he is so nearly well.'

'Well, indeed!' we exclaim, as Johnnie hurries past, with an indescribable 'hop, skip, and jump.'

'Why, his walk is simply shocking.'

'It's not elegant,' admits Sister, amused; 'but he is able to do without a splint now; and if he goes to St Thomas's when he leaves, they may be able to do something for his stiff knee.'

'Is it the result of an accident?'

'Oh yes. He is a healthy enough child naturally; but in crawling about, he got a needle into his knee, and that has meant years of abscesses, operations, and stiffness.—Well, Mary, what do you want?' as an excited face peers in at the window.

'Oh, please, Sister, do come and look at this queer thing,' says Mary, a poor stunted specimen, nearly as broad as she is long; and standing on such spindle-legs, one wonders how they support her thick-set frame.

The 'queer thing' turns out to be a frog; and Cockney Mary receives a needed lesson in natural history, including the fact that frogs do not enjoy a hail of stones! Much illness has this poor little maid known in her twelve years of life; but the tiresome abscesses do not pain her now, and she is thoroughly enjoying her taste of the country.

And now we turn our attention to the children's ward, such a capital room, that it is difficult to believe it was not built for its present purpose. Extending the whole depth of the house, with a window at each end, even the bed-ridden children

can enjoy the gardens, back and front, whilst some are carried, bed and all, to revel on the lawn. The ward is made bright by other things than its windows: the eleven little beds, with their spotless counterpanes, look tempting enough to woo sleep to any eyes; whilst the many-pictured walls suggest endless fields of speculation for childish imaginings. A well-polished floor adds to the general cheeriness; and a nice harmonium, the gift of a friend, is both ornamental and useful, the children, as usual, taking great pleasure in singing.

The day is so lovely that only two or three are indoors. Wee Florrie, by the window, lies all day and every day on her face, her head to the foot of the bed; and in spite of pain and weariness, it is a very bright little 'skeleton' who tells of a wonderful doll that has been promised for her 'very own.' By the hour she will amuse herself with a doll, petting and loving it with a tenderness that is pathetic. A scrap-book, too, is a delight to Florrie; and she greatly enjoys some that have been made by stouter hands than her own, in a home where healthy, happy children are taught to give time and pains to the brightening of less favoured lives.

'Can you read, Florrie?' we ask.

'Oh no; I've been in 'orspille too much.'

'Yes,' adds Sister; 'it is quite true. She and poor Jamie in the garden have never been well enough to go to school, and they have both suffered so much, no one has tried to teach them anything.'

Florrie, we learn, has recently undergone an operation, a distinction which roused the envy of the ward. 'Tarnt me have to-ro-form too?' pleaded a mite of four.

'Oh! I don't like chloroform,' remarked an older hospital habitué; 'ether suits me best.'

'Indeed,' says Sister, 'their comparing of experience would be too comic from such baby-lips, if it were not for the under-tone of sadness.—But,' she adds, 'I must say they do not seem to see the sadness themselves; they are just happy in the present, or take comfort in thinking they will soon be better.'

A bronchial couple on either side the fireplace need screens even on this warm day; and the way those mites of four go through their troublesome fits of coughing and submit to all treatment, might well teach a lesson to most grown-up patients. In addition to bronchial troubles, one little maid is an abscess victim, and the other has lost a leg. The poor 'Museum,' as she is playfully called, was, when received, a choice specimen of the spoilt-child genus, and quite expected obedience to all her commands. Finding she could not get her own way in everything, she commenced a series of cries for 'Mother,' which were kept up by the hour, till her weak point was discovered to be the possession of a beloved 'ampage' (handkerchief), the withholding of which was punishment enough to ensure silence. The precious ampage had to be folded small enough to be within the grasp of Gertie's hand, where it remained day and night, to the exclusion of such commonplaces as dolls or toys! Indeed, the loss of her treasure was quite enough, in Gertie's estimation, to warrant her waking the nurse in charge, with the command, 'Find my ampage!' But a few weeks of gentle control have made

another creature of Gertie, who now attaches a different meaning to the word 'obey;' and in spite of her terribly bandaged head and neck, she is a pleasant little soul to look at. Her vis-à-vis, who would have been a fine child but for her misfortunes, has but one fear, which expresses itself at sight of the doctor, in a monotonous wail of, 'Don't want t' lose me other leg.'

'Is there any fear of it?' we ask Sister.

'Oh no; but she is afraid, because the leg that has been operated on does not heal, and has to be looked at when the doctor comes. She is rather a "special" case: a good operation going on well for a time, and then a cessation of healing power. She has been sent from a London hospital, and we all think the fresh air will give a new start towards healing.'

'But she cannot get into the fresh air?'

'Oh yes; she can. She gets about very well on crutches. It is only their coughs that keep both children in to-day. Our chief aim is to give them all as much open air as possible.' Then leading the way into the garden, she adds: 'Here you have all the rest of my flock.'

A merry little party it is too, full of eager talk, and unconsciously enjoying the bracing air which comes across the heath in refreshing draughts. A capital lawn makes a safe playground; and at sight of us, Baby Dot demands to be taken out of her perambulator for a 'wau' on the soft grass. Such a sweet little thing is Dot! One of those children who win their way to all hearts by a certain nameless grace, which, added to a pretty face and bonnie eyes, make Dot quite irresistible. And yet, alas! she is the victim of a brutal father's drunken fury. Kicked out of bed and cruelly injured, the poor mite was taken off to the nearest hospital, where she was under treatment for many months. The father, after undergoing a term of imprisonment, paid Dot a visit in hospital; but even her baby-mind had grasped facts sufficiently to greet him with loud cries of alarm. He is in prison again, Sister has heard, for wife-beating; but it is very much a case of 'six of one, half-a-dozen of the other.'

Poor Dot is getting better from the hip-injury which left wounds that did not heal in London air; but as the baby-fingers clasp ours, and the sweet voice lisps an offer to 'Dot 'oo a butting-hole,' it is impossible to help a shudder at the thought of what lies before the offspring of such parentage. But all unconscious of her future, comes the eager cry, 'Ere 'oo is,' and a daisy of Dot's own picking is confided to our keeping. 'Butting-holes,' Dot's generic name for flowers, tells of her mother's calling; but she is not the only little Londoner who revels in country spoils. Poor wee Janie, one of the very worst cases, is enjoying a bunch of freshly gathered forget-me-nots, which grow luxuriantly round the garden; and he is for the time at least absorbed to forgetfulness of the many ailments which make him, at eight years old, a physical wreck.

'No hope for him, I fear,' says Sister; 'but he is so dear and good, he shall have every chance.'

'But with such wounds, how can he bear to be dressed?'

'Oh, he cannot; he is only wrapped up loosely, and that gray dressing-gown a friend sent, just covers him up nicely.'

'I suppose you get a good many things sent you?'

'Well'—with a laugh—'not quite so many as we should like. Those pretty wool-hoods the girls have on came from a lady who promises cooler ones next week; and the red flannel jackets for wearing in bed were made at a children's working-meeting. But we could certainly do with more, especially in the way of pinafores and boots. —You see what Gracie is like in the boot-line, as a child of ten crosses the lawn, in a pair of carpet slippers that must have been large for her mother.'

'But surely no one could expect her to walk out in such things?'

'Well, the fact is she could not walk when she came; and her parents are so poor, that the purchase of a pair of boots is not a thing to be accomplished in a hurry; so, for the present she and Alice have to take turns with my only reserve of shoe-leather.'

Alice, whose turn it is to wear the reserve boots, now comes up and asks if she may help to get the little ones ready for a walk. She is the eldest of the party, and though very small of her age, has quite the town-child's precocity, and promptly packs Dot and the 'next youngest' into the perambulator with an experienced air that is very edifying.

Master Johnnie looks on with rather a doleful air, not sharing the general delight in a walk; but he gains something of importance by feeling himself the only male protector of the family!

As the perambulator is led off, Sister remarks: 'That was a useful present, and I am longing for a second; so few of the children can walk any distance without a lift now and then; and nice as our garden is, I do not like to keep them always in it.'

Very nice the garden undoubtedly is. Beyond the lawn, with its borders of flower and shrub, lies a good kitchen-garden, capable of supplying a large share of the household's vegetables; and at the bottom is a gate, opening on to the Heath itself, where one could wander for hours in undisturbed communion with nature.

Looking at the house from the garden, we remark on its suitability for present uses.

'Yes,' replies Sister; 'it is just the thing; the only drawback is no bathroom; but perhaps some day we may be able to build one leading out of the down-stairs ward; you see it would just fit in there'—pointing to a spot which might have been reserved for the purpose.

On the other side of the house is good stabling, with capital rooms above, one of which is secluded enough to offer perfect quiet for a night-nurse, whose rest must perforce be taken during the bustle of day-life. The stable is at present used as a laundry, and the whiteness of the piles of linen would make many a housewife envious.

'Do you keep a laundry-maid for this department?' we inquire.

'Oh yes; but it does not take her whole time, and I should like to get one good family's washing. That is'—with a smile—'until we are happy enough to be able to use the stable for the pony-chaise which is one of my ambitions.'

'I suppose it would be a great help with the children?'

'It would indeed, especially in getting to and

from the station. It is a good three miles off, which makes it awkward sometimes, although there is an omnibus twice a day, and the cabmen are merciful in their charges to us.'

'Does the distance prevent parents' visits?'

'Oh no; they manage it, one way or another, unless, like poor Dot's parents, they do not care enough to take any trouble.'

This little talk has been carried on during our progress through the lower part of the house, including a bright kitchen with a convenient window, communicating with Sister's sitting-room. And now we mount the one flight of stairs which lands us on the top story. Above the large downstairs ward are two rooms, both in only partial use. The larger, overlooking the garden, has been brought into requisition a few times for adult patients, but, as Sister longingly remarks: 'It would make a beautiful ward for eight children!'

'And would that be as many as you care to take?'

'Quite. A larger number would alter the character of the place; we want to keep up the home-feeling, and to know each child personally.'

'Do you take children only?'

'I do not say that; we certainly prefer them; but at anyrate whilst this room is not otherwise engaged, we do not refuse adults really needing fresh air and nursing.'

'Of course, more patients would mean more nurses.'

'Most certainly; and even now we should like a second lady-pupil. A young girl, fond of children, could be very happy here, I am sure; and with such cases as ours, there is a good deal to be learnt. For instance'—opening the adjoining door—you see, my co-worker, who is also a trained nurse, is taking charge of a very bad case. Annie has had bronchitis, pleurisy, and pneumonia, and was for days in a tent-bed, with a steam-kettle constantly going, and jacket-poultices to be kept hot; and even yet she needs watching day and night.' The little patient looks white and thin enough still; but there is a tone of triumph in her kind nurse's voice as she says: 'We shall pull her through.'

'Do you keep this room for special cases?'

'Oh no; it is really a nurses' sitting-room, or at least it will be, when I get a full staff and a sofa or armchair. Then we have a small room for a lady-visitor, invalid or not'—leading the way to a cosy nest, which, in spite of a sloping ceiling, boasts such a lovely view over miles of heath, tree, and water, that we feel sure it would never be empty were its existence better known.

'I should not mind a few more comforts for this room,' says Sister; but adds with a laugh: 'You will think there is no end to my wants.'

'Well, you have not put the usual first, at anyrate. I suppose you "want" contributions?'

'They would certainly not be refused! And unless I get outside help, I shall never be able to complete my number.'

'I think your patients pay, or are paid for?'

'Invariably. I have had too much experience not to make this a rule; but the payments only just cover the cost of maintenance.'

'I suppose fresh air freshens appetites?'

'"Freshen" is a mild way of putting it: the increase is simply incredible; and besides plenty of good nourishing food, our children consume an

alarming amount of their beloved cod-liver oil, which is not by any means a cheap dainty. Then, too, in such a case as Annie's, the expenses are heavy. Three pints of milk in the twenty-four hours, cream, new-laid eggs, and two ounces of brandy, besides champagne at the worst, makes a considerable hole in seven shillings a week!'

'And how do you meet the expenses other than maintenance?'

'I make myself responsible for everything; but I reckon on some portion of the expense being met by friends and helpers.'

And we venture to think the 'reckoning' will not be in vain. Our last impression lives still in the memory; and we wish our readers could share the sight of the happy group of children seated at tea in the bright ward, made brighter by the glow of a setting sun. Each little face is gravely intent on doing justice to the bracing Bushey air, an intencness fully shared by terrier Tip, the house-friend, who is on capital terms with the children, especially at meal-times.

And remembering the chance of renewed health that is thus being provided for the sickly children of Babylon, all will agree in wishing well to this new effort, which, if successful, will doubtless be copied in all directions, and be the means of greatly increasing the usefulness of existing hospital-work. Full information can be obtained on application to the Lady Superintendent, Miss Derham, Heathbourne Cottage, Bushey Heath, Herts.

THE ORIGINAL MAGNA CARTA.

IN that amusing book, the *Curiosities of Literature*, Dr. Israeli describes how Sir Robert Cotton found his tailor holding in his hand an original Magna Carta, which he was about to cut up for measures; and the story, whether true or not, may make us thankful for the happy chances which have preserved some of our most valuable national documents. No doubt, many of the highest interest have been destroyed; but some, such as Domesday Book, still survive; and when we think of the perils from neglect and from active violent enmity, their survival is a matter for wonder and thankfulness. The Articles of the Great Charter of King John is another fortunate survivor; and one, or two Great Charters themselves exist which have a fair claim to be called originals.

The Great Charter, it will be remembered, was agreed to by King John on the 15th of June 1215 at Runnymede. It was, in truth, not an Act of Parliament or statute, but a treaty between the king and his subjects, and was framed upon a series of forty-nine Articles drawn up by the barons and presented to the king. There were consequently two separate documents: one, 'The Articles of the Great Charter of Liberties;' and the other, 'The Great Charter' itself. Neither were signed by either the king or the barons. Both were sealed with the Great Seal of King John; and, as we shall see, there is some evidence that the Great Charter was sealed by some of the barons; but the barons do not appear to have sealed the Articles.

The original Articles are in the British Museum, and a fac-simile of them is exhibited to the public. They are written in Latin, on parchment ten inches and three-quarters broad,

and twenty-one inches and a half long including the fold for receiving the label. To the label, the Great Seal of King John is still appendant; but, unfortunately, the whole document has been greatly damaged.

Its history is very obscure. At an early date it was probably deposited at Lambeth, and it apparently remained there till 1645. At the end of the seventeenth century it was in the possession of Gilbert Burnet, Bishop of Salisbury, and he gives, in the *History of his Own Time*, the following account of the manner in which he came by it. When the impeachment of Archbishop Laud was brought to the bar of the Lords, 'he, apprehending how it would end, sent over Warner, Bishop of Rochester, with the keys of his closet and cabinet, that he might destroy or put out of the way all papers that might either hurt himself or anybody else. He was at that work for three hours, till, upon Laud's being committed to the Black Rod, a messenger went over to seal up his closet, who came after all was removed. Among the writings he took away, it is believed the original Magna Carta passed by King John in the mead near Staines was one. This was found among Warner's papers by his executor; and that descended to his son and executor, Colonel Lee, who gave it to me. So it is now in my hands; and it came very fairly to me.' For this conveyance of it we have nothing but conjecture. As Burnet had been allowed to search all the public records, Lord Dartmouth suggests that the above account was intended to allay any suspicion that he had obtained so valuable a document in a less justifiable manner.

From Burnet the Articles descended to his son, Sir Thomas Burnet; then to his son's executor, named Mitchell; from whose daughter it was bought by Earl Stanhope, and presented to the British Museum in 1769.

When the Articles had been agreed upon, they were reduced to the form of a charter, and this is the true Magna Carta of King John. It is said that a very large number of originals were made, and one was deposited in each diocese, some say in each county, but this is scarcely probable. One of these originals is still preserved in the very curious and interesting old library at Lincoln Cathedral. It is said to have been discovered among the documents there, in 1763, by Dr Richardson; and the word 'Lincolnia' endorsed in a contemporary hand on two folds gives reason to believe that it was the charter transferred by the hands of Hugh, the then Bishop of Lincoln, who is one of the bishops named in the introductory clause. In the British Museum are two more originals, both belonging to the Cottonian manuscripts; but they are not considered of such high authority as that at Lincoln.

One of the Cottonian charters has a small part of the Great Seal of King John still attached; but the whole is much injured; the other is in better preservation, and, though it has no seals, it has three slits in the parchment, apparently for labels to which seals have been attached, that in the centre being the largest. It is therefore possible that seals of barons were formerly attached to it, and it is probably the document referred to in Smith's catalogue of the Cottonian

manuscripts, dated Oxford 1695, as having the seals of some of the barons appendant. It may also be that described by Isaac D'Israeli in his *Curiosities of Literature* as having been rescued by Sir Robert Cotton from his tailor, who was about to cut it up for measures.

Such is all that we have succeeded in discovering about originals of the Great Charter of King John. The fact that there are two documents of the same date has given rise to much confusion and to many misstatements, even by authors who might have been expected to have known better; but this is not the only source of error, for there were several reissues of the Great Charter, originals of which are apt to be confused with the Magna Carta of King John. The first of these reissues was by Henry III. in 1216. An original of this *Magna Carta Regis Henrici III.* exists in Durham Cathedral. It itself states that it was sealed by Gualo the legate and William, Earl of Pembroke. The seals are lost, but the labels to which they were affixed remain. The second reissue was in 1217, and the original is in the Bodleian Library at Oxford. It still bears the seals of Gualo the legate and William, Earl of Pembroke. The third reissue was in the ninth year of Henry III. (1224-25). There is an original at Durham Cathedral, which has unfortunately been injured by the accident of having some ink thrown over it; and there is another original at Lacock Abbey, in Wiltshire, the seat of Charles Talbot, Esq. Both have the Great Seal of Henry III. still attached.

Among the Cottonian manuscripts in the British Museum there is an original confirmation of Magna Carta, dated 36 Henry III. (1251-52). It is bound up in a volume of charters. In 1297 Edward I. sealed at Ghent a confirmation of Charters; and Magna Carta is consequently described in modern editions of the statutes as either of the ninth year of Henry III. or of the twenty-fifth year of Edward I. The history of these original charters is a good illustration of the haphazard way in which some of our most valuable public documents have been preserved, and makes it easy to understand that many others have disappeared or only exist in a fragmentary condition.

TWILIGHT.

Through the black arch of interlacing trees
Burns the red sunset, and a blue mist lies
Cold on the darkening meadows, whence arise
Faint dewy odours as the evening breeze
Sweeps o'er the sombre grasses of the leas,
And in the gloom of leafy branches dies;
Waking to being as the daylight flies
An adumbration of dim memories,
Ah! the enchanted realms that used to be
In the wide reaches of our childhood's sky,
Vague, lonely, far, immeasurably high,
In the mysterious fields of Infancy,
Beyond whose ultimate verge we could descry
The brooding shadow of Infinity!

HOW LEPERS WERE TREATED IN OLDEN TIMES.

By A. E. GIBBS, F.L.S.

THE disease of leprosy, and the terrible and lingering sufferings it entails upon its wretched victims, have lately been forced upon public attention by the story of the heroic life and death of Father Damien, the noble-hearted priest who devoted himself to a living martyrdom that he might bring spiritual consolation to the poor sufferers in the leper settlement in Molokai. Although it is well known that leprosy is prevalent in eastern lands at the present day, and people are familiar with the stories of Sacred Writ which show how common the dread disease was in bygone times in Palestine and adjoining countries, yet few are aware that four or five hundred years ago it was a fearful scourge in this island home of ours. All over England there were to be found institutions, erected by the Church or by the aid of the benefactions of pious donors, for the segregation and relief of the afflicted. At one time nearly every town had a leper hospital or village in its vicinity, whilst many places were provided with more than one, as Norwich, which had six, or Lynn Regis with five. Professor Simpson tells us that in 1226 there were two thousand leper-houses in the then limited kingdom of France. In very early times this disease, which has truly been described as one of the most incurable and loathsome of human maladies, existed in Britain, and was the subject of some very severe and cruel laws. The state of filth in which our Norman forefathers lived was very conducive to the spread of the disease; and at the time of the Crusades there is no doubt it greatly increased owing to the intercourse which then took place with eastern lands. The disease was naturally very much dreaded, not only on account of the fearful character of the malady and the intense physical suffering it caused, but perhaps even still more because it resulted in ostracism from society and the breaking of all the bonds of kinship, which must have

been far worse. In the thirteenth and fourteenth centuries, a leper was not allowed to hold property, was deemed incapable of making a will, and lost all the privileges of citizenship. He was hunted from the towns and driven from the dwellings of men; he was forbidden to drink from the running stream, lest he should defile it, and it was unlawful for him to touch things that were used for food by man. Anything was deemed good enough for the leper. Fish left putrid and unsold in the markets were thrown to him; and game and animals found dead in the woods were sent to the nearest leper hospital. He was scarcely treated so well as a dog; whilst the hawk that sat upon the fist of the baron or squire received far more attention. His was a terrible doom—a living death. 'Sick and heart-broken and alone, he was doomed to isolation, or to keep company only with those who were afflicted like himself. When a man was accused of leprosy, he was examined by a doctor; and if found 'guilty,' all hope was gone, and he was compelled to bow to the terrible verdict of banishment from the society of his fellow-men, which the law pronounced necessary for the health of the community. He was taken to a church, where a fearful and gloomy service was read over him. Often the mass for the dead was used, and earth was thrown upon his feet, the priest reciting such sentences as 'Sis mortuus mundo, vivens autem Deo.' Ten terrible prohibitions were laid upon him; and after a blessing from the priest, the poor wretch went forth into solitude. Thus the grave closed almost literally over him.

Nor did the disease spare the great ones of the earth. Richard de Wallingford, the Abbot of one of the richest monasteries in the kingdom, the world-famed Abbey of St Albans, was a man of immense learning and great piety, and, for his time, possessed marvellous scientific knowledge, but, like Naaman of old, 'he was a leper.' His influence and wealth enabled him, though not without great trouble, to maintain his position as ruler of the Abbey until his death.

The Church of the early Middle Ages became

the champion of the poor leprous outcasts, and established in different centres hospitals for their reception. Near to the great Benedictine foundation of St Albans, two of these institutions were erected—one for men, dedicated to St Julian the Confessor, the patron saint of hospitals; and the other for women, to the Blessed Virgin, and called, from its situation among the meadows in the Ver Valley, St Mary de Pré.

The Hospital of St Julian has a particular interest for us, as there has fortunately been preserved a document in which are set out the rules laid down for the government of the leper community. From them one may obtain a very good idea of the mode of life in a foundation of this character in the fourteenth century. St Julian's was not a wealthy house. Compared with such large foundations as the great lazaret-house at Sherburne, in Durham, which had an endowment of £142, 0s. 4d., Burton Lazars, in Leicestershire, or Maiden Bradley, in Wiltshire, the income of the Hertfordshire hospital was small, and the pittance allowed to the brethren very humble. The inmates were permitted to provide themselves with extra comforts if their means allowed them; but if they were entirely dependent upon the charity of the foundation, and received only the scant rations the house furnished, they were infinitely better off than they otherwise would have been.

The Hospital was founded by Abbot Geoffrey de Gorham, who ruled at St Albans in the twelfth century. He was a man of great energy, and he appears to have made provision for the maintenance of the place by giving it a handsome endowment. Two popes and two kings were induced to specially interest themselves in the Hospital, Henry II. making it a perpetual grant of one penny a day from the royal treasury. In 1344, Abbot Michael de Mentmore made the special regulations for the government of the house which have been preserved for the information of nineteenth-century students. They show that the government was placed in the hands of a Master. There were always to be at least six lepers maintained; and in applications for admission, leprous monks of the monastery of St Albans were always to have preference, especially if they were natives of the town; but laymen were also eligible. If the applicant were a villain or serf, he had first of all to obtain his freedom.

The most strict regulations were enforced as to the dress of the lepers, a precaution justified by the terrible nature of their malady. They were to have a tunic, supertunic, and hood of russet, and curious and particular directions were given as to the shape and mode of fastening these garments. Out-of-doors, a black cloth cape was allowed to be worn, but it was to be closed after the manner of a mantle. It was probably much the same sort of thing as is worn at the present day in that least progressive of all European countries, Spain, where people are muffled up at night in a long black mantle, the folds of which are so arranged as almost to hide the face, leaving only the eyes visible. The lepers had besides this cape a cowl of the same colour and made of the same material. Their shoes were high cut, fastened round the leg with three or four knots, and under these they were allowed to wear stockings. They had to attend church every day, and

a list of the services at which they had to be present is to be found in the document. Most stringent were the regulations forbidding them to leave the Hospital, and ordering the gates to be kept closely shut. Strict injunctions are set upon them, enjoining them to dwell in unity and brotherly love. Says the Abbot: 'Since slander disturbs the minds of the peaceful, let not the leprous brethren presume to slander one another, either chaplains or lepers; let them not relax their tongues to a whisper, but mutually study to carry themselves with brotherly love, in true charity,' an exhortation which might with advantage be studied by inmates of charitable institutions at the present day.

The provisions made for the sustenance of the lepers are curious and interesting. Their diet was not very varied. Each leper had seven loaves every week, five of white bread and two of brown, made from corn (just as it had been threshed from the sheaf). Every seventh month each man was given fourteen gallons of ale, or, if he preferred it, eightpence instead—beer was an inexpensive luxury in those days—fourteen gallons for eightpence. On certain feast-days the rations were increased, and Christmas Day was celebrated right merrily, for each had forty gallons of ale, or if he chose, forty pence, and two quarters of pure and fine corn. The sum of fourteen shillings was also divided between them on that day, to be spent in the purchase of muffers. On St Martin's Day each one had a pig from the common herd. In order that there might be no quarrelling or unfair division, the pigs were driven into their presence, and each one, in order of seniority of admission, chose his animal; and if the supply of pigs gave out, or there were no pigs, an equivalent was given in money. On the 14th of February, each one received a substantial valentine in the shape of a quarter of oats; and during the winter, or in Lent, a bushel of peas and a similar quantity of beans for making pottage were served out. On the 24th of June each received two bushels of salt, or its current value. On the same day four shillings a head was paid to them for clothing; while St Alban's Day, St Julian's Day, and Easter Day were marked by the gift to each of one penny. On Ascension Day a sort of spring-cleaning evidently began, for they each received a halfpenny, 'for the taking away from themselves of dirt.' Shrove Tuesday, always a day of rejoicing in the Middle Ages, was probably celebrated by eating pancakes, for each man had given him measured flour of the weight of one of the white loaves. With these gifts the lepers were commanded to be content, the remainder of the property of the Hospital being devoted to the maintenance of the Master and the priest brethren. The latter appear to have been better clothed than the lepers, and in all respects better provided for; but they were as strictly confined within bounds and forbidden under penalty to mingle with the outside world. This interesting institution appears to have survived until the reign of Henry VIII., when it was suppressed with the parent monastery.

Hardly fifty years had elapsed after the death of Abbot Geoffrey de Gorham, founder of St Julian's Hospital, when a similar institution was built for the relief of women. The Hospital of St Mary de Pré was founded by Abbot Warren, in obedience to a divine command, miraculously

conveyed to him, and the foundation was attended with the usual superhuman occurrences with which the students of monastic records are familiar. When the Hospital was erected, Abbot Warren caused certain leprous women to be shut up in it; but the number to be accommodated is not stated. Proper offices were erected for them, and a cloister was constructed, and they were directed to give themselves sedulously to prayer. A strict rule was enforced; no one was allowed to go out; and punishments were inflicted upon the refractory. So large were the Abbot's gifts to the new institution that the monks grumbled, and a bitter feeling arose between the Abbot and the convent.

In the course of time leprosy died out, and the Hospitals were devoted to other uses, that of St Mary de Pré becoming a simple nunnery. Enough, however, has been said to show how real and terrible an evil leprosy was to our forefathers in the Middle Ages.

JOHN VALE'S GUARDIAN.

CHAPTER XXXIV.

THE more Snelling thought of it that night, the more definitely he saw how shamefully ill-used he was, and how distinct a right he had to be revenged. The morning's reflections brought with them a gnawing sense of shame, for he could not doubt that his conduct had seemed to justify his expulsion. That of course made things none the better for his adversary. It is no cure to hatred to find itself altogether in the wrong. It is easy for the man who has right on his side to be magnanimous. When the disputant has not a dialectic leg to stand on, it is only in human nature that he should lose his temper. Neither real love nor real hate stops to ask questions: each is its own supreme reason.

Snelling heaped up a store of hatred which he held in reserve against the innocent cause of his disgrace. If the thing could have been done with safety, he could have killed him, and that looked so far removed from likelihood that he gave himself the satisfaction of openly admitting as much to his own mind. If the means had lain ready to his hand, he would not have dared to contemplate them; but since they did not, and were never likely to come within his grasp, he allowed himself to covet them.

If it had not been for his ward, Jousserau could never have come into his life at all. And there—as if there had been a need of it—was another reason for his hatred of young John. From the hour since he had first taken charge of his nephew's fortunes, no good thing had befallen him. He had encountered nothing but libel, defeat, and shame. If it had but occurred to him to think that there was not an event in the whole history which was not clearly due to his own villainous first intention, the reflection might have been of service to him.

Amongst other petty annoyances came the difficulty of finding a new house for himself. The winter was a hard one, and unusually protracted, and for months it was impossible to begin the rebuilding of the old place, which lay in unsightly ashes. He was compelled to live on at the *Barfield Arms*, or to go into lodgings; and little as he

liked the former course, he preferred it to the other. He had a long-drawn dispute with the Insurance Company, and since he could produce no complete inventory of the goods lost in the fire, it was made clear to him that he would have to sit down with a considerable loss on that score.

He passed months in miserable anger, and developed a standing grudge against the world at large. John stayed with Isaiah Winter, and his guardian was contented to see but little of him. Of Jousserau he saw nothing whatever, and only heard that he had fitted up as a studio a large room in the upper story of Isaiah's house, and was working there in almost complete retirement. There was just one drop of sweetness in his cup: the Frenchman visited no more at Shorthouse's. The old farmer had made up his mind by this time as to Jousserau's intentions, and when he had talked of his suspicions to Cecilia, he had seen enough to make him believe that she was growing dangerously interested in the foreigner. He put his foot down, therefore, in John Bull fashion, and with no periphrasis forbade Jousserau the house.

Things were in this state when the spring came slowly up that way, and stayed in that position until the beginning of summer. Then two things happened which set Snelling's cup of bitterness fairly brimming over. In the first place, Proctor came with a beaming countenance to announce the discovery of precisely such another outcrop of coal as had been found on the land of Farmer Day. As in the former case, the coal lay against the great stone wall of the Fault, and was immediately workable at a startling profit. But it was on John's land, and not on Snelling's. It was, in point of fact, at the very limit of John's property, and his guardian owned nothing within two-thirds of a mile of it.

'The y's in luck,' said the mining engineer. 'By the plot you've given me, he has five hundred and seventy acres, and I make no doubt there isn't a yard of it that won't pay—and pay well—for the getting.'

'Yes,' said Snelling darkly, 'the lad's in luck, as you say.'

How he hated him for it is beyond the power of words to express. Proctor went on to explain that the discovery was equal to the proof of coal on Snelling's own land. Passing beyond John's workings, where they were developed, he would be able to reach his own coal, and to work safely under the sand-drift which had impeded his first operations.

'He'll be rich before I shall,' said Snelling.

'Yes, sir,' returned Proctor, rubbing his hands, 'that's pretty true. In point of fact, Mr Snelling, the lad's rich already.'

This was the first phial of bitterness, and Snelling in tasting it made no wry faces, at least in public. It was Parson Heathcote who brought the second, and who held it so repeatedly to his lips that he could not forbear a sign or two. The summer weather had barely set in, and the bricklayers were at work raising new walls on the foundations of the old. Snelling naturally rode over from time to time to see how the work was progressing; and Master John, with a boy's native longing for danger, was naturally there on half-holidays to run about the bare rafters which already stretched over the cellars, and to climb

anything which looked particularly breakneck and inviting. Snelling rode there on a Wednesday afternoon, and found his nephew perched on a dangerous eminence at the south-west corner of the old house, where the wall had by some accident or series of accidents escaped the fire.

'You'll break your neck one of these days, Master John,' said the uncle in a tone of good-humoured remonstrance.

'I'm all right, uncle,' John responded. 'I've been up here a dozen times.—Haven't I, Patsy?'

'Faix, ye have, then,' one of the workmen responded; 'but not with my good-will, young gentleman.'

Snelling took no further notice of the boy, but calling the man in charge, sat in the saddle to listen to his account of progress. Whilst the two were talking, the vicar jogged up on a steed as comfortable and as highly polished as himself.

'Good-day, Snelling,' he said. 'Rebuilding the old place, I see. I was glad to hear you were insured.'

'They're pretty slow in paying,' Snelling growled. 'I can make nothing out of 'em as yet.'

'Oh, they'll pay you—they'll pay you!' said the vicar. 'Very just and liberal office.—Hillo! who's that perched up there?—Snelling, Snelling! that's dangerous. Do you see your nephew there?—Come down, you young rascal; come down at once. Upon my word, it makes me giddy to look at him.'

'It's all right, sir,' piped John. 'There's no danger. I've been up here lots of times.'

'Curious!' said the vicar, 'how the repetition of an offence appears to justify it to the boyish mind.—Take care there, sir!—The boy puts my heart in my mouth.—Really, Snelling, you should exercise more authority; you shouldn't allow him to peril his limbs in that way.'

'Ah!' returned Snelling angrily, 'there's one blow hot, and one blow cold. The whole countryside gets filled with lies about me because I want the lad to learn his lessons; and I suppose I'm up to some wickedness now because I let the young monkey have his way.'

At this instant, John, half-way down from his perilous height, missed his foothold, and fell, bringing a handful or two of loose rubble down with him. The vicar cried out in terror; but the lad was on his feet again in a second, laughing. 'No harm done, sir, unless I've spoiled my jacket. It's lucky, though,' he added, 'that I fell into the mortar, and not on to the stones.'

'Come here, sir,' said the vicar sternly; and John, approaching, took hold of the reverend gentleman's stirrup leather and looked up at him with so fearless a good-humoured candour that wrath was more than half disarmed.

'If I were your uncle,' the vicar said, 'and had charge of you, I should follow an escapade of that sort by a smart application of the cane, Master John. You have taken an elderly clergyman's nerves, and that is a thing, let me tell you, which, from the elderly clergyman's point of view, merits punishment.'

'Really, sir,' John urged, 'it's quite safe. I've been up lots of times.'

'His neck won't get broke that way,' said Snelling with a pretence of a rough *bonhomie* he was far from feeling.

The vicar shook his riding-whip at John, who smiled at him in the certainty that no harm was coming.

'The soundest whipping won't dust that jacket for an hour or two,' said the parson, smiling also in spite of himself.—'No more mischief now, do you hear?'

'I'll be careful, sir,' the boy answered, and so moved away.

The vicar moved his horse a foot or two nearer to Snelling's. 'By-the-by,' he said, 'this reminds me. They tell me that coal has been found on your nephew's land. He will be a wealthy man one of these days.—You mustn't take offence at what I'm going to tell you, Snelling; you're much too sensible a man for that, I know. But even if it were otherwise, I should feel it my duty to speak.'

'Say on, sir, if you please.' It galled him to be told that John was going to be wealthy. The bitter avaricious grudge against the boy was always in his mind.

'You are John's guardian,' pursued the vicar, 'and it is your plain duty, and will of course be your pleasure, to breed him up in accordance with his prospects. Now, this is all very well if he were going to be farmer, miller, and maltster, like his father before him; but, as I gather, the boy will have so much money that the education he is receiving will be scarcely finished enough—scarcely fine enough—to meet the case. He has the local accent rather strongly, and here he can never get rid of it. You should send him to one of the public schools. Let him have a tutor for half a year, and then send him to Rugby.—Rugby's pretty close, you know, and he wouldn't be out of your sight there. Then in half-a-dozen years he might go to Oxford. You must really make a gentleman of the boy, and give him his chance in the world.'

'He's being bred,' said Snelling, 'as well as he's got any right to ask to be, better than his father was afore him, and better than I was. I don't want a young juckanapes from Oxford lordling it over me. If he learns enough to manage his property when he comes into it, he'll have no right to grumble.'

'Believe me, Snelling, you're wrong. The whole district will think so. You have not merely the boy's best interests, but your own reputation to consider. By the time he comes of age, your nephew will be one of the wealthy men of the county, if all tales be true; and you must rear him in accordance with his expectations. Things have been said, you know, Snelling—I don't believe them, I never have believed them. If I had believed them, you may take it for granted that I shouldn't be sitting here and talking to you now. But the things have been said all the same, and you have your own reputation to consider.'

'Hold hard a minute,' said Snelling, in his heaviest tones. 'We'll have a look at that matter, if you please, sir, and we'd best go to the fountain-head.—John!' he cried, raising his voice, 'come here a bit, while I talk to you.'—John came, and his guardian turned upon the parson. —'There he is; ask him anything you like. If you'd prefer it so, I'll ride away.'

'My dear sir,' said the vicar, 'I don't wish to ask the boy any questions.'

'Very well, then,' said Snelling with a surly persistence, 'I do.—John, you've got nothing to hide; you can tell the truth without fear, favour, or affection. Have you got anything to complain of?'

'No, uncle,' the boy answered—'nothing.'

'You ran away from home the better part of two years ago, didn't you?'—John spread out his hands and made a little grimace, as if protesting against this raking up of bygones.—'What made you do that?'

'I should have got a thrashing if I hadn't,' said John, somewhat shyly.

'Who from?' his guardian demanded. 'Me?'

'No,' said John; 'Mr Macfarlane.'

'Now, answer me truly; did I ever lay a hand upon you in my life?'

'No,' the boy answered; 'never.'

'Sense you've come to know and understand, sence you've come back to live with me, have I ever spoke one unkind word to you?'

'No, uncle,' John said again; 'never.'—It was hardly accurate, but it was true enough in the main, and a happy boy's memory for reproof is short.

'Now,' resumed Snelling ponderously, bending over in the saddle and emphasising his question with his riding-whip, 'do I treat you harsh or do I treat you kind? Is there anything you've got to find fault with?'

'No, uncle.'

'Very well, then,' said his guardian, turning once more towards the vicar.—'You can put them questions to him by yourself, sir, if you like it better, and he'll answer 'em the same way.'

'You mistake me altogether,' the vicar answered.—'You can run away, John.—I never charged you in my own mind with unkindness to the boy; I only wanted to hint to you that people are watching your guardianship of him in some quarters a little jealously, and that you are expected to do your duty by him. You can only do that by giving him an education of a higher kind.—Don't you see, my good fellow, that the case demands it? The boy will be wealthy one of these days. Not merely well-to-do, but rich; a dozen times better off, perhaps, than his father ever fancied. He must have his chances.—Now, think over what I have said, like a good sensible fellow, as you are; and so, good-morning. I hope we are none the worse friends or neighbours for what I have said; but I had to discharge my conscience.—Think over it, Snelling; think over it, and you'll agree with me.'

Isaiah trundled up in the brake, behind the pair of steppers, as Snelling, with rather a bad grace, shook hands with the vicar. The clergyman saluted Isaiah with a cheery 'Good-morning, Winter,' and a motion of his whip, and then jogged away, as unconscious, good easy man, of having laid fuel to Snelling's murderous fires as ever man was in this mixed world of the result of his interference with another's business.

'Now, wheer do you think I've come from?' said Isaiah genially.

'I'll tell you when I've time to think about it,' Snelling answered, wheeling his horse round. But then, suddenly remembering that he had not too many friends in the world, and that

Isaiah, in spite of the fact that he housed his two enemies, was the one man on whom he could rely for kindly feeling, began to oburgate the vicar.

'Don't mind me,' he said. 'That parson's put me out o' temper. He runs that eagle-beaked nose of him into everything.—You were going to tell me something, 'Zaiah; what is it?'

'Why,' said Isaiah, readily pacified, and accustomed from of old to his ancient employer's moods and tempers, 'I've been over to Brummagem to mek a bid for Tallymount Hall.'

'Tallymount?' repeated Snelling. 'What do you want with Tallymount? The place is in ruins.'

'It ain't so bad as you'd fancy,' said Isaiah. 'There's four rooms there as sound as nuts; there's three or four more as fifty pound 'ud put right for the next twenty year. As for the ruins, there's seventy or eighty o' 'em; but they don't count. There's a stable in fair repair—you could do it up for a fiver—and there's a noble kitchen, just like it was left in old times, when the Tanants had got money in their pockets. There's six acres of the old park-land left, there's two acres o' garden, and a biggish paddock. If a bachelor has a fancy for living wild and lonesome, he can do it there as well as anywhere.'

'I reckon you're i' no danger o' being a bachelor again, Isaiah,' Snelling answered.

'No,' returned Isaiah, laughing. 'It ain't for me; it's for my lodger. Between you and me, gaffer, them painting chaps is the queerest kind o' cattle as lives. He's seen the place, and he's took a fancy to it, and he's wild about it. He says he could live and die and lay his bones there with pleasure. I told him only yesday—"Here you are," I says, "in a house brand-new, furnished from top to bottom, with the mortar hardly dry on the walls," I says; "and everything brand-new from the roof to the kitchen poker; and here you be," I says, "mad to live in a tumble-down, old haunted place as nobody's looked at this thirty year." But he's fell in love with it, and there's no shaking him. He's got me to do the business for him; and I've as good as done it. I'm standing out on a matter of fifty pounds on a seven years' lease; but young Tanant wants the money; and I think he'll tek what I've offered. You might as well pour water into a sieve as money into that young man's pocket.'

'Isaiah,' said Snelling, with a smile of meaning, 'in matters of business I've always found you pretty close until now. If I meet you to-morrow, you and me will have a laugh about this.'

'As how?' said Isaiah.

'I'll tell you when we meet again,' Snelling answered. 'I'm a bit pressed by business for the moment. That meddling vicar has kept me here for a good half-hour.—Good-morning, Isaiah.'

Isaiah returned his salute, and sighting young John, bade him come home to change his clothes. Meantime, Snelling rode away. Here at least was a chance of placing a thorn in his adversary's side. If Jousserau wanted to live in a ruin, he should at least pay for that privilege. He would raise him by a hundred pounds or two, and if he lost the money entirely, he could afford to do it for the gratification of his hate.

A half-hour's ride helter-skelter along the

country road, and at a decorous jog-trot through the town, brought him to the land-agent's doors. Snelling knew the doors well, for his own bank stood opposite. He threw his reins to a street boy and dismounted.

'Tallymount Hall's to let; what's your price for it?'

The clerk he accosted looked up from his work, referred languidly to another clerk, and looked down again. The second clerk advanced, and leisurely turning over the leaves of a volume made up of printed scraps and manuscript entries, turned it round upon the counter voicelessly and struck an uninterested finger on a page.

'Seven years' lease,' said Snelling. 'No repairing covenant. Three hundred and fifty pounds.—Give me a pen, young man, and draw up a receipt.'

He drew his own cheque-book from his pocket and filled in a leaf of it, standing there at the counter. 'Send somebody across the road with that,' he said gruffly, throwing down the leaf he tore from the cheque-book.

The clerk, staring a little at the heavy emphasis with which he spoke, took the cheque in to his employer, who, recognising the name of the signator, came out smiling. 'We are in treaty for this already, Mr Snelling.'

'My money's as good as another man's, I reckon,' said Snelling; 'and here it is.'

'Your money is quite good enough for me, Mr Snelling,' responded the man of business. 'You can have a receipt in the meantime, and the formal receipt can be ready to-morrow.'

'There's one spoke in the Frenchman's wheel!' said Snelling to himself as he waited. There was no trifle too small to soothe his hate; but he looked about in his own mind in vain for the draught that would quench it.

IN THE ALBANIAN MOUNTAINS.

I AM sitting on an old packing-case outside an Albanian cottage in the great mountains, looking down a long arid slope of stony plain to the distant hills across the lake. At my side a lithe, broad-shouldered mountaineer sits cross-legged upon a thick cloak spread upon the boards. It is a brilliantly hot afternoon in July, and the sun would be unbearable were it not for a row of poplar trees which shelters us from the heat without obscuring the view, and so I and my companion sit still in the shade and watch the thin blue rings of smoke from our cigarettes floating lazily upwards in the heavy air. We do not talk very much; but as the mountaineer is an intelligent man, and actually speaks Italian, I gain a good deal of information from him at first hand. He is a keen politician in his way, and has wonderful odds and ends of knowledge stowed away in his brain; but his little world is only the mountain and plain of North Albania, and his idea of Europe is entirely derived from what he sees of the Austrian Lloyd steamers at the port of Medua. As he discourses upon his fellow-countrymen, the Sultan, and the Great Powers—utterly bewildered by matters which are to a European the simplest things in the world—he seems to me like a man groping in the dark, straining his eyes to pierce the gloom that draws so impalpable and

yet so dense a veil between him and what he seeks. And somehow, on this dreamy afternoon, when mountain, plain, and lake sleep under the July sun, I find myself half slipping into his mode of thought; and as I lean back against the cottage wall and look with half-shut eyes at the blue haze quivering in the valley below, my life in England seems a thing of the remote past; I seem to have always lived in Albania, instead of only for a few years. Perhaps, after all, the Skipetar are right, and the European sovereigns are only chiefs of Frankish tribes, who take advantage of the quarrels among the Sultan's subjects to further their own petty aims. All other countries seem vague and unreal, and only the politics of the rocks and lowlands of Albania appear of any consequence.

Soon I am aroused from my dream. Of course my friend knows that I am an Inglese; that all the Inglese are very rich; and that, as they have no room in their own little country, they wander about the territories of the other Frankish tribes, much as his own clan of Skrelli is forced by want of pasturage to migrate every year to the richer land by the coast near Medua; so, to increase his knowledge, he asks me, as delicately as possible, in order not to hurt my feelings by the comparison, whether London is as big as Scodra. I inform him that in my country there are a thousand towns bigger than Scodra, and that he might ride for three or four hours in a straight line through the bazaars and streets of London without getting out into the country. The struggle between incredulity and politeness is plainly shown on the mountaineer's face; and I see that I have lost greatly in his esteem by my assertion, and that he looks upon me—to put it plainly—as a liar. He knows from priests and other Franks that the Inglese have no country but London, a miserable place, where it rains all the year; and where no one would stop who was not forced, as is proved by all the Inglese who are free to move wandering into other Frankish lands, and even into the realms of the Sultan. Nothing will shake his opinion; it is hopeless to fight against this wall of colossal ignorance. We English are too given to thinking that all foreigners see us as we see ourselves; not as merely the inhabitants of two little islands in the northern sea, but as the masters of an empire that rings the circle of the world and floats its navies upon every sea. The more ignorant foreigners who draw their information from priests or demagogic newspapers look on England as a foggy island peopled by uncouth heretics, who are only tolerated because they fling gold broadcast in every direction. My Skrelli friend has no doubt derived his geographical and historical knowledge from some French or Russian source, and therefore despises me as an untruthful braggart, though he is too polite and perhaps too politic to say so.

I have come up into the mountains for a few days to see village life and to get a breath of fresh air, for the lowlands and the city are stifling. Not a drop of rain has fallen for two months; the grass has become sand, and the plants are drooping in the gardens for want of water. The little village of Zagora, in which I purpose spending the next day or two, lies at the head of the long wedge-shaped piece of stony land, running up from the lake and shut in by bare and lofty

mountains, which constitutes the territory of the Skreli tribe. Down the centre of this valley, and at the bottom of a steep ravine, runs the river which waters the arable land. A narrow strip of ground on each bank is cultivated, forming a winding ribbon of dingy and sun-burnt green between the bordering expanses of white stones and parched rocks. But the tribe has its winter pasturage near Medua; and towards autumn the whole of Skreli, men, women, and children, with their flocks and their herds, their horses and their household goods, will desert their mountain home and file in long procession across the stony plain through the bazaar of Scodra, and so, by way of the Zadrima, to Medua. My companion, finding I cannot be trusted to tell him of my own country, changes the subject to himself and his belongings, which are for me more interesting topics than comparisons between London and Scodra. And so I learn that in summer-time he is a farmer in the mountains, and in winter a boatman at the wretched seaport of San Giovanni di Medua, where he has learned a fair amount of Italian while bringing passengers and their baggage to shore. In this fashion he manages to earn enough money to make him a little bit of a mountain dandy, and to enable him to carry better arms than the mountaineers of the neighbouring tribes who spend all the year round in their rocky homes. He informs me that he is very well known at the port, and gets plenty to do; and then, being in confidential mood, tells me about his family and his children, and that he has a blood-feud with one of the most powerful families of the neighbouring Hotti tribe, and so never goes out of the village alone, for fear he should be shot for the blood he owes his enemies. His sister, he explains, married a man of Hotti, and it was considered a splendid match, as that tribe is the most powerful in the great mountains, and takes the post of honour in time of war. About a year after the marriage, the husband repudiated his bride, and sent her home, giving no reason for the outrage, but merely saying he was not going to keep the woman any longer. Such an insult was not to be tolerated; so my host and his brother, seeing that there was no chance of obtaining for their sister the restitution of her rights, looked out for an opportunity of killing their brother-in-law.

'He was very cunning,' says my host reflectively, playing with his pistol; 'but I waited for him every day, and at last I caught him alone, and then I shot him for the slight he had dared to put on our family.'

'And so you owe them blood?'

He grins, and arranges his pistols in his leather *sila*. 'His father and brothers,' he replies, 'often come into our country to look for me, and wait for me outside the bazaar or on the road to Scodra; but I never go into the city without my brother and my relations; so they cannot exact the penalty without fighting a battle.'

'But surely that must be a great nuisance for you?'

He shrugs his shoulders: 'Some day they will catch me alone, as I caught him, and then they will shoot me if they can.'

'And your sister?'

'She is in the city.'

'Has she married again?'

'Married? Oh no! She begs: she has her child.'—Then seeing my look of astonishment, he adds: 'What is she to do? We cannot support her; she does not belong to us now; and the Hotti will not keep her. But I have avenged the insult; I have shot her husband.'

Truly, honour and dishonour are arbitrary words! My companion is, according to his own code, a man of strict honour. His sister has been repudiated by her husband without cause or reason; and he feels that he has done everything he can be expected to do when he has shot the erring husband and left the poor woman to escape starvation as best she may by begging in the streets of Scodra a bare subsistence for herself and child!

But the sun has been gradually sinking towards Mount Rumia, and once he is below the hills everything is dark. The women, with little kegs strapped on their shoulders, come out of the cottages and strike across the fields. 'They are going to draw water from the river,' explains my companion; 'shall we go to see them?' He carefully looks to his arms, and then we rise and, joining two or three other men, stroll through the maize and tobacco fields, between the wait-a-bit thorn hedges, to the ravine. During the violent rains of autumn and winter, the Proletar, as the river is called, dashes a foaming torrent along its rocky bed; but at the end of the summer it has become like most mountain streams, a quiet little river, half lost among the pebbles it flows over. In Indian file we descend the narrow path that winds through the brushwood edging the steep sides of the ravine, and I should feel put to shame by the activity and sure-footedness of the young girls, were it not that I know they would make a much worse scramble of it than I do had they boots on their feet instead of raw-hide sandals. Soon we get to the bottom, and then we seem to be in an amphitheatre, for, owing to the abrupt turns and winds of the river, we are shut in on all sides by almost perpendicular walls of rock. The floor of the ravine is covered with sand and pebbles, and down the centre trickles the dwindling stream, across which we easily jump. The narrow space is crowded with the inhabitants of all the Skreli villages, whose only water-supply in summer is drawn from the curious well in this part of the river's bed. The men lounge about conversing in groups, and every now and then a marksman fires his pistol at a stone or bush on the side of the cliff with a bang that startles the echoes from crag to crag, and makes one fancy, from the violence of the concussion, that a hundred-ton gun at least has been discharged.

Under an overhanging rock, a quaint parapet and basin have been carved out of the living stone, and round them the maids and matrons are gathered in picturesque groups, laughing and chattering. It is the month of a well that sinks deep down beneath the bed of the river, and is never dry in summer. When the rains come and send the torrent from the mountains, the well and its curious basin are covered deeply by the tossing waters; but when the hot weather returns and the river runs nearly dry, the well is uncovered again, and, as to-day, the buckets and long ropes are eagerly competed for by the crowd of women, who fill their little wooden

kegs every day just before sunset. Only one man comes down to draw water, an old white-headed man, bent now and infirm, but who has evidently been a magnificent broad-shouldered giant of over six feet in height. I ask why he is drawing water for himself. 'Oh!' is the reply, 'he has no women or relations; he lives by himself; besides, he is quite crazy.' Poor old man! he is the last of his family; his wife and daughters are dead; and his sons have succumbed to steel, bullet, or fever, leaving him alone in his old age. The border wars, blood-fends, and malaria of the lowlands, that have taken away his brothers and sons, have passed him by, and left him an infirm veteran, no longer a great warrior, but a useless survival of the past. He speaks to no one, but having filled his keg, shoulders it, and toils slowly and alone up the steep path.

The shadows deepen among the cliffs; the last woman has filled her barrel and staggered panting up the rocky ascent; and so we return home too, my Malisor friend keeping his hand on his pistols and glancing suspiciously at every bush, for perhaps some Hotti avenger is lurking in the deep shadows and even now levelling a pistol or rifle. Luckily, there is no enemy near, and we reach the village in safety, or rather the row of six tiny houses which is the principal part of the hamlet. Most mountain cottages are built detached from one another, and consist simply of a single room on the bare ground, with perhaps a small apartment screened off for the mistress of the house; but here are half-a-dozen cottages built all in a row like modern villas, and only inhabited on the first floor, after the fashion of the houses in Scodra. Each house in the row has its ladder leading up to its first floor, and its little balcony with the living-room opening out of it. In no other mountain village have I seen this arrangement, which is evidently an innovation on the received architecture of the Malisori, and is no doubt to be ascribed to the tribe's yearly residence on the sea-coast.

The usual mountaineer's supper is soon prepared—roast mutton and cakes drenched in honey, and then, after coffee and more cigarettes, I think of going to rest, for it has been a long day since I roused my little household in Scodra at about two hours after midnight, before the sun had begun to rise. I have no fancy for sharing the stuffy little inner room with the grandmother, the mother, the wife, and the children of my host, not to mention other less visible occupants, nor a plank bed on the balcony with a couple of mountaineers; and that is why I brought the little tent that gleams white in the moonlight through the shrubs among which it is pitched. My hostess and her sister cut me plenty of soft fern in the afternoon and spread it on the floor of my tent; and so, after wishing my Albanian friends 'Good-night,' I retire to my own lodgings. As I stumble through the thicket by the imperfect light, my footsteps rouse the watchdogs, which strain fiercely at their chains and make the valley ring with their savage barking. From the distance comes an answering chorus of yelps, marking the position of neighbouring villages in the darkness of the night. The moon, already low down in the sky, casts long shadows across the land, and almost obscures the glitter of the stars, and dims the brilliance of the comet that

is blazing away across the heavens above the row of tall poplar trees outside the village. Creeping head first into my narrow tent, I wrap myself in a rug, stretching full length upon the fern, the softest couch a man can have; and soon the baying of the watchdogs weaves itself, an indistinct bass, into the current of my dreams.

MRS LAMSHED'S WILL.

CHAPTER III.

MR DOTTLESON, who had just come back from the City, walked away to the park, and sought a secluded bench, whereon he seated himself, and drew out the letter he had taken possession of. What did his mother-in-law want with this young doctor now? And why did she send her letters by hand, instead of putting them in the postbag? He had a right to know what it meant, and he intended to find out. The envelope was carelessly gummed and came open without difficulty. He unfolded the enclosure, and bit his lips with chagrin as he read it:

MY DEAR DOCTOR—Come and meet Sir Alfred Blodget here in consultation at noon to-morrow; he is coming to see me.—Yours sincerely,

MARIA LAMSHED.

Mr Dottleson stared at it, and a few emphatic words escaped him. What *could* his mother-in-law be thinking of? To ask a young man who was little more than a medical student to come and 'consult' with the very first authority of the day! It was ridiculous; it made a farce of Sir Alfred's visit. What an outrageous thing it was for the woman to do!

'Of course, it can't be allowed,' he said to himself; 'and I'll just take the responsibility of posting this letter—in time to be too late for him to keep the appointment.'

He replaced it in his pocket, and returned home, deeply vexed at what he looked upon as a mean attempt to take advantage of his generosity. His thoughts flew back to the conversation he had had with Mrs Lamshed the day before; how he had urged his dutiful anxiety for her health as the reason for calling in Sir Alfred Blodget; and then, in spite of himself, he recalled how he had carefully arranged this to supplant Dr Lakeworth; and now, instead of doing anything in that direction, his scheme was made use of to benefit the man. Oh, it was very disheartening, and enough to aggravate any one. No wonder that Mr Dottleson entered his house in a frame of mind which caused Kate to avoid him, and made the servants quake in their shoes as they waited upon him at dinner. Everything had gone wrong, as things have a way of doing when our little tempers get the better of us: the soup was smoked, the fish done to rags, and the joint as tough as leather. Kate, who was skilled in reading the paternal barometer, took little time to discover that the hand was set at 'Stormy,' and knew better than to deliver herself of her grandmother's message, asking if Mr Dottleson was quite sure he had left the note for Charles Lakeworth at the right house; indeed, she had a faint suspicion that the said note might have caused the present disturbance in the domestic atmosphere, and judiciously abstained from referring to it. So her father,

shielded by his smouldering passion, was allowed to keep it in his breast-pocket undisturbed, and the untruth he had ready remained unspoken.

He started for the City earlier than usual next morning; he wanted to evade being questioned about the letter until he had despatched it, but he was careful not to commit it to the post until nearly eleven o'clock. Then he felt easier; he had foiled the first attempt to make capital out of his liberality, and had gained time to remonstrate mildly with Mrs Lamshed upon the absurdity of her ideas. It occurred to him more than once during the day that detaining the letter was not quite the best way of beginning operations; but if that cropped up, as it was tolerably sure to do, he must plead failure of memory or make some excuse of that kind. He walked home to Blake-wood Square that afternoon, wondering much what the result of his manœuvre had been, and warning himself that he must be prepared for an outburst of wrath heretofore unheard of on the part of his mother-in-law. The nearer home he came, the more awkward he felt his own attitude in the matter to be, and had he found it necessary to confront Mrs Lamshed at once, he would have made out a poor case for himself.

It chanced, however, that she was indulging in her customary afternoon siesta when he came in, and he was fully posted by his daughter in the events of the day before the old lady awoke. It seemed that punctually at twelve o'clock Sir Alfred Blodget had called; but there was no Dr Lakeworth to meet him. At Mrs Lamshed's earnest request, he had consented to waste five minutes of his valuable time in waiting to be introduced to 'her doctor.' At a quarter past twelve, just as Kate entered the room, he drew out his watch and rose to go; she dashed recklessly into the breach and succeeded in detaining him until nearly twenty-five minutes past the hour, but still no Charles Lakeworth appeared. Then the great physician had looked annoyed, and picked up his hat, making caustic remarks about the independent manners adopted by struggling practitioners. When Mr Dottleson heard this, he felt that he had at all events sown the seeds of a good misunderstanding between Sir Alfred and Dr Lakeworth, and that his task with Mrs Lamshed would be easier; but he had not heard all that Kate had to tell him. Three o'clock brought Charles Lakeworth to the house in a flutter of disappointment; he had with him the note which had been written yesterday, but which the City post-mark proved to have been despatched to-day. Grandmanma had been exceedingly angry, and told Dr Lakeworth that she would sift the matter to the bottom as soon as Mr Dottleson came home, and further promised to make another opportunity of introducing him to Sir Alfred Blodget.

Mr Dottleson did not feel quite so well after hearing that; but as he received a summons from his mother-in-law almost immediately after Kate had finished her story, he had no time to prepare a brief for his defence.

Mrs Lamshed was lying amongst her pillows panting for the fray; she waved her son-in-law to a seat at the bedside and attacked him at once. 'It was a great pity you forgot that note, after taking it from Sarah, Montague; the contents were most important—most important.'

'So Kate has been telling me,' said Mr Dottleson; 'and so I imagined from the fact of your sending it by hand.'

'It was worth anything to Charley Lakeworth to meet Sir Alfred professionally. Considering how the boy stands towards Kate, you ought to regret having deprived him of the chance he had to-day.'

Mr Dottleson was very far from regretting it, but did not think it advisable to say so; on the contrary, he hastened to expound his own views. 'You could not have weighed the matter with your usual good sense, when you asked that young fellow, who is scarcely more than a student, to meet such a man as Sir Alfred in consultation. Sir Alfred would, I am sure, have felt grossly insulted had he seen the person you wanted to introduce to him in such a manner.'

It was an unhappily worded sentence; the back-handed allusion to her 'good sense,' the suggestion that Sir Alfred would have been grossly insulted through her instrumentality, and finally the careless reference to the 'person,' stung the old lady to the quick. She turned upon him sharply and spoke with rising temper.

'You're jealously careful of Sir Alfred's sensibilities, Montague. You don't see the advantage of extending a helping hand to a deserving man who wants it, do you?'

'I have no wish whatever to impede his progress'—

'Or to help it either, no doubt; you seem to forget that he's engaged to Kate.'

'He isn't engaged to Kate, and won't be, till he can satisfy my requirements.' Mr Dottleson was a passionate man, and was letting his feelings get the mastery of him. It irritated him sorely to be taken to task like this by Mrs Lamshed, and he lost sight of his own interests in the anger of the moment. Mrs Lamshed paused for a few seconds, and then produced the card she always had in her sleeve when she wanted to crush her son-in-law, but this time it failed utterly. 'Must I remind you again that there's still plenty of time for me to alter my will, Montague?'

'I have no control over your intentions, madam; you are quite aware that my daughter Kate is dependent upon me, and will ultimately inherit all I possess.'

It was a very gentle hint that if he were cut out of her will in favour of Dr Lakeworth, Kate would be the real sufferer; but it had its effect upon Mrs Lamshed.

'I don't think Kate would lose much. Those two will be faithful to each other, however long you may keep them apart, in your greed.'

'I will never raise a finger to thwart Kate's happiness if she marries a man of whom I can approve.'

'Then you don't approve of Charles Lake-
worth?'

'No, Mrs Lamshed; I do not. As things stand now, I most emphatically disapprove of him; and there's an end of it.'

There was a dead silence for five minutes, until Mrs Lamshed spoke again, calmly and quietly: 'Please ring the bell, Montague.'

He did so without a word, and stepped back to his place by the bedside, where he stood facing his mother-in-law. Mrs Lamshed neither moved nor spoke till her maid appeared and asked for

her commands. Then she collected herself as if for a spring, and sat bolt upright with her white hair falling upon her shoulders, whilst she pointed with her thin trembling finger to the door. Her sunken eyes flashed with suppressed excitement as she spoke the words which Montague Dottleson remembered till the very last day of his life. 'Send for Smuggles's partner,' said Mrs Lamshed.

Although the order was ostensibly addressed to the maid, Mr Dottleson knew that it was in reality given to himself. He offered no protest; perhaps he recognised that it would be useless; he pulled out his watch and glanced at it before he answered, which he did in tones whose coolness surprised himself and were evidently not pleasing to Mrs Lamshed. 'It's now half-past six, and the office will be shut.—Do you know the gentleman's name and his private residence?'

His mother-in-law glowered angrily at him for a few seconds before she replied: 'No, I don't. I want Smuggles's partner.'

Mr Dottleson bowed, and quitted the room: he was in no hurry to discover the nameless individual who was to assist in altering the will. 'I'll wait until to-morrow,' he thought as he went to his own chamber; 'she may have changed her mind by the morning.'

But morning came, and Mrs Lamshed was as firm in her purpose as she had been the evening before. Her son-in-law went to her room to make inquiries about her health before he set out for the City, and was startled at the change for the worse which had taken place during the night. Her breathing was heavy and laboured, and there was a listless apathy in her manner which contrasted painfully with her wonted brightness. She seemed indisposed to speak to any one; but when he referred to her demand for 'Smuggles's partner,' she roused herself with an effort. 'It's Starbone and Smuggles—Lincoln's Inn—ask for—his partner.'

'Are you well enough to attend to business to-day?' asked Mr Dottleson anxiously.

'Yes,' said Mrs Lamshed. 'Send him to me now—at once.'

He said nothing more; but as his gaze rested on the form of the old lady, who seemed to be drawing near her end, a dark thought crossed his mind. She could not last very long; she was breaking up rapidly; a few days, in all likelihood, would see the last; he could forget her commission to-day, and perhaps—

'Don't forget to call at Starbone and Smuggles's office, Montague; I shall expect the solicitor here at twelve o'clock.' She spoke more fluently than she had done before, and seemed to hint pointedly at his singular forgetfulness in that matter of the note to Dr Lakeworth. He turned red under her searching eyes, and hastily dismissing his half-formed design, promised to attend to her wishes without fail. After all, it would answer no good purpose to neglect them; she could easily send another messenger, if she distrusted him; and he felt that he had little claim to her confidence. She would put the true interpretation on his remissness, and visit it all the more severely upon him. No; he must close his eyes to the nature of his errand, and execute it with that honesty whose mother is necessity and whose child is self-interest.

He had no difficulty in finding Messrs Starbone and Smuggles's office, where he was received by the surviving partner, a gaunt melancholy man, who dwelt in a little back room lined with battered tin deed-boxes.

'Mrs Lamshed?' said the gaunt man wearily.—'Lamshed?'—Ah, yes; I remember: 10 Potfield Gardens, isn't it?'

'That was Mrs Lamshed's address at one time,' said Mr Dottleson. 'My mother-in-law now resides with me, at No. 21 Blakewood Square. She is particularly anxious to see you as soon as possible. Could you conveniently call upon her at about mid-day?'

The melancholy solicitor chewed the stump of a very old quill pen thoughtfully, and referred to a memorandum slab on the table. 'To-day is Wednesday. I will attend Mrs Lamshed at noon,' he said in a funeral voice.—'Will you be good enough to say that I—Mr Reginald Slimp—will be in attendance at noon?'

Mr Dottleson shook hands with him and withdrew. He intended to telegraph down to let his mother-in-law know that he had lost no time in carrying out her directions; it would look disinterested and might have a softening effect. Accordingly, he wired, telling Mrs Lamshed that she might expect Mr Reginald Slimp to be with her at the hour appointed. 'I may wash my hands of it now, I suppose,' he said as he affixed the telegraph stamp. 'I may sit down and wait for the earthquake.'

That was a long-remembered day at 21 Blakewood Square. Mr Slimp arrived at twelve o'clock, armed with a formidable parchment envelope, which he carried in his hat up to Mrs Lamshed's room. The old lady dismissed her maid with instructions not to return and to prevent others disturbing her until she heard the bell, as she was going to be busy with the visitor. Charles Lakeworth called, and, for the first time during his acquaintance, was told that his patient was engaged, and could not see him.—Was Miss Dottleson engaged? No. Then he would see her; and was taken up-stairs forthwith.

'Is anything wrong, Kate?' he asked as he took her hands. 'Why won't Mrs Lamshed see me?'

'Hush!' said Kate (the old lady's apartment was next to the drawing-room). 'There was a quarrel of some kind last night, and grandmamma sent for her lawyer. I suspect it's about her will. He is with her now; they've been shut up alone together for nearly an hour.'

The bell rang sharply at that moment; and a message was sent to the butler to go to Mrs Lamshed at once. He was not detained very long; he was only called upon to sign his name, after seeing the old lady inscribe hers at the bottom of a document; and a few minutes after he left the room with the maid Sarah, who also acted as a witness. Mr Slimp with his papers followed, looking, if possible, more melancholy than ever. His aspect gave an increased air of solemnity to the occasion, and impressed the under-housemaid who let him out with the conviction that something very deep and mysterious indeed had taken place up-stairs.

Sir Alfred Blodget paid his visit soon after the solicitor had gone, and found the invalid with her grand-daughter and the young doctor for whom he had been kept waiting the day before.

'Explain,' said Mrs Lamshed to Kate, nodding at Charles Lakeworth and then at Sir Alfred. Nothing loth, Kate informed the latter how the miscarriage of a note had caused the mistake of the previous day, and introduced Dr Lakeworth as the physician who had taken care of her grandparent for the past twelve months. Sir Alfred was extremely gracious; but Miss Dottleson was a little disappointed to find that he did not at once retire to the window with Charles and earnestly discuss the case in low tones, which was her preconceived idea of a 'consultation.' On the contrary, he only patted Mrs Lamshed's hand kindly and told her to stay where she was for a day or two; said so quite independently, without even asking the younger doctor if he didn't agree with him. It was not much of a consultation, reflected poor Kate, when the great man went out followed by the small one; and she told Mrs Lamshed her opinion of Sir Alfred, which was quite at variance with that usually entertained about him.

'You are intimate with the family, I understand?' he said to Charles Lakeworth as he drew on his gloves in the hall.

'Yes; I have known them well for some time.'

'Well, you may mention to Mr Dottleson that I can do nothing more than you can, and shall not look in again.—Very old woman. Course of nature. I shall be surprised if she sees the light of Sunday.—Good-day; very pleased to have met you.'

The brougham rolled away with Sir Alfred, and Charles Lakeworth returned to Mrs Lamshed's room. He had known before that she was seriously ill, but did not possess the experience which told the older man that her lease of life had so nearly expired. He was charged with the duty of telling Mr Dottleson that the case had been left in his hands as hopeless, and he would have to break the news to Kate also, a task he cared for even less. He would not tell her yet, he decided; she had no idea of Mrs Lamshed's real condition, and it would only prolong her grief to reveal it sooner than was actually necessary. Mr Dottleson must be told, of course, and he waited until that gentleman came home, in order to see him.

'You arrived here soon after noon, you say, Mr Lakeworth,' said Mr Dottleson, when he had been told Sir Alfred's opinion. 'Did you see Mrs Lamshed at once?'

'She was engaged when I came, and I did not see her until her visitor had gone.'

'Mrs Lamshed seemed to me to be a little strange in her manner last night and this morning; do you think her faculties are perfectly clear?'

'Perfectly clear. She is very weak, and is growing weaker almost every hour; but her mind is quite sound.'

Mr Dottleson had conceived the idea that his mother-in-law might if necessary be proved mentally incapable of making a new will, and did not intend to give up the notion yet. He would send a line to Sir Alfred Blodget about it; Dr Lakeworth's opinion was hardly worth having, and might, moreover, be prejudiced. He lost no time in writing to the doctor, and waited until late that evening in keen anxiety for his reply; it

would be a great triumph if he succeeded in getting this codicil legally set aside, for he had firmly persuaded himself that it was in Charles Lakeworth's favour. Whatever its provisions might be, he would be acquainted with them in a few days—by Sunday or Monday, at the latest. It was hard that, after all these years, a slight blunder should throw out his calculations when the end was almost in sight; it was very hard. Still, there was a shred of hope left. If such an authority as Sir Alfred Blodget could certify that he had seen Mrs Lamshed half an hour after she had altered her will, and that she was then incapable of understanding what she had done, he was safe. He could snap his fingers at Dr Lakeworth and kick him out of the house.—Here was the answer from Sir Alfred at last. He snatched the letter from the servant and tore it open in nervous haste:

Sir Alfred Blodget presents his compliments to Mr Dottleson, and has pleasure in assuring him that Mrs Lamshed was perfectly capable of transacting any business such as he refers to at the time he visited her to-day.

Foiled! He crushed the paper into a shapeless lump and threw it into the waste-paper basket. Whatever the old harridan had done, it was done, and would hold good. He swallowed his passion, and went up to see his daughter.

LIQUID IN CRYSTALS.

Like the famed drop in crystal found,
Floating while all was frozen around.

FROM these lines of Moore we learn that liquid inclusions in crystals, which have proved such an instructive and fascinating study for modern geologists, were at least noticed in comparatively early times. For not only does the poet mention the famous drop, but tells us also in a note that he alludes to a certain curious gem upon which Claudian wrote some very elaborate epigrams. This same gem was a piece of crystal, *glacies*, by which we may probably understand crystallised quartz, enclosing within it a drop of liquid. It seems to have exercised a wondrous fascination over the mind of the Roman poet: he has left us no fewer than nine epigrams upon it, seven in Latin, and two in Greek. His poetic fancies, and speculations as to the origin of the curiosities, are full of interest and beauty. Like modern investigators, he considers the liquid as bearing witness to the origin of the crystal: 'Possedit glacies nature signa prioris' (The crystal retains marks of its former state). Moore further cites Addison, who had seen a curiosity of the same kind at Milan, and again at Vendôme, in France. And, whether the men of science of those days attempted to account for the phenomenon in accordance with the knowledge they then possessed, or not, the popular mind accepted an explanation embodied in a beautiful legend. It is Addison who relates that at Vendôme it was believed that the liquid drop was a tear shed by our Saviour over Lazarus. An angel gathered

it up, and placing it in a crystal vial, presented it to Mary Magdalene.

The ground thus formerly occupied by the poet and weaver of legends is to-day eagerly explored by the geologist: the study of liquid and other inclusions in crystals is an important branch of his science. Such liquid drops as those above alluded to were relatively of large size, and rare. Claudian's gem is esteemed *raras inter opes*; but those of the geologist are mostly microscopic and exceedingly abundant. Their size varies from one ten-thousandth of an inch up to a few large enough to be seen by the naked eye. That method of petrographical research, first practised by Mr Henry Sorby, which consists in grinding down a slice of rock until thin enough to be viewed under the microscope, has revealed the fact that the crystals of igneous rocks contain innumerable cavities of varied form and contents.

The first rock section thus ground down for the microscope marks an important epoch in the annals of geology; it has opened a door by which numerous investigators have entered to explore new realms of knowledge. It deserves, then, the honour paid to it; and, shined in morocco case in its owner's pocket, may be said to enjoy a dignified retirement. Microscopic sections are now prepared in great numbers and with much accuracy, especially in Germany, where the taste for minute work of all kinds is more powerfully developed than in England. In some crystals as many as from 1,000,000,000 to 10,000,000,000 cavities are found to exist per cubic inch. By their investigation much light has been thrown on the origin of the rocks in which they occur; while the fascinating veil of mystery still hanging over certain points invites further study. At first, the cavities studied by philosophers were the larger ones visible to the naked eye, and more akin to the imprisoned liquid of the poet than to the minute inclusions of the geologist of to-day. Such were those described by Sir H. Davy in the Philosophical Transactions of the Royal Society for 1822, from which memoir we may date the modern scientific study of liquid inclusions in crystals.

More recently, the subject has been taken up by that diligent experimenter and writer of memoirs, Mr Henry Sorby, who has applied to it his method of grinding down rock-sections for the microscope. In 1857 he read a paper before the Geological Society of London in which he endeavoured to show 'that artificial and natural crystalline substances possess sufficiently characteristic structures to point out whether they were deposited from solution in water or crystallised from a mass in the state of igneous fusion; and also that in some cases an approximation may be made to the rate at, and the temperature and pressure under which they were formed.'

The interpretation of these *nature signa prioris* retained by the crystals involves vast labour and knowledge; the experiments, by reason of the minuteness of the cavities, require excessively delicate manipulation; the necessary calculations are intricate. The results obtained are of great interest and importance; while a careful study of Mr Sorby's paper (*Journal of the Geological Society*, vol. xiv.) shows us further the amount of labour expended in producing a scientific memoir of value.

The cavities occur in igneous rocks—granites, basalts, and lavas—and are of great variety as to their form and contents. Some are entirely filled with liquid; but the majority contain a movable bubble like that of a spirit-level. Others, besides the bubble, contain minute crystals of various substances. Some, again, have two distinct liquids and a bubble. The most interesting and puzzling of these bubbles are those which seem to be endowed with spontaneous motion.

Claudian's liquid inclusion must have had a movable bubble, for he says of it: '*Varias itque reditque vias*' (By various ways it comes and goes). They are found mostly, however, in the smaller cavities, and may be observed traversing their prison-houses from end to end in tortuous courses, as though trying to escape; 'as if,' says Mr Sorby, 'they were minute animalcules swimming about and exploring every part of the cavities.' To the poet they were veritable prisoners; the frozen waters forming the crystal hold the liquid in bondage: '*Nymphæ, quæ tegitis cognato carcere Nymphas*' (O waters, who in kindred prison guard the waters).

Starting from one end of the cavity, the bubble describes a curvilinear course from side to side to the other end: in returning, a similar course cuts the other in many points. The wonderful thing is that this complicated double path thus traced out is always followed by the moving bubble. Here is a mystery which has not yet been satisfactorily explained. Why should the bubble thus oscillate from side to side and from end to end of its cavity? Above all, why should it always travel on the same line? It is no regular geometrical curve which is traced out, and the forward and return paths do not correspond in form. Truly, the more we contemplate these wonders, the more we are inclined to say, as Claudian said, '*Liquidi crescunt miracula saxi*.' Other simpler movements of some of the bubbles may perhaps be explained as the result of alterations of temperature, acting on their sensitive equilibrium.

But what is the nature of these contained liquids? They have been shown to be water, liquid carbonic acid gas, and hydrocarbons; hydrochloric and sulphuric acids also occur. Those examined by Sir H. Davy contained nearly pure water.

Various delicate and beautiful methods of analysis have been devised for the determination of the microscopic quantities of liquid, but these must be passed over here. Let us note briefly some of the theoretical results obtained from the study of these cavities in the rocks. It is to be inferred, then, that the rocks containing them, if they have cooled down from igneous fusion, must have done so under great pressure. This pressure, in fact, must have been great enough to keep the contents of the cavities liquid at a temperature which under atmospheric pressure would have converted them into vapour. Of course this argument could not apply to lavas which have cooled at the surface; but it has been observed that in these the crystals containing cavities bear evidence of being derived. It is supposed that crystals from the granite mass below floated on the molten lava, before it was ejected from the volcano, without being fused. When the lava was poured out, the granite crystals came with it. This seems

to indicate that granite and lava are formed from the same subterranean reservoir; and thus the study of the cavities adds a fresh link to the chain of evidence which now leads geologists to consider granites, basalts, and lavas as produced from the same molten mass by diverse circumstances of cooling. The theory held by the older geologists not so very many years ago, that granite was the original first formed rock of the globe from which all others had been derived, is now exploded. Granites are known to be of all ages. With regard to granites, it is inferred that igneous fusion alone will not account for their formation: water has been present and played its part in the process.

Inferences have also been drawn from the quantity of liquid in the cavities as to the approximate depth at which certain granites have been formed. The expansion of the contained liquid at different temperatures being known, it can be calculated how great a pressure would be required to keep a certain quantity in the liquid state at a given temperature. This involves a careful estimation of the amount of liquid in a cavity. When their minute size is remembered—1,000,000,000 to 10,000,000,000 per cubic inch—the difficulties to be surmounted in obtaining the necessary data may be conceived.

First of all, the size of the cavity must be measured as accurately as possible; then, that of the bubble must be ascertained. The difference of these gives the amount of liquid. If, now, it is known, or can be estimated, at what temperature the rock was fused, it can be calculated what pressure was required to keep the liquid within the limits of the cavity. Such measurements and calculations have actually been made by Mr Sorby. The result thus arrived at is that many granites have been formed at depths of from five and a half to fifteen miles. Since many of the same rocks now appear at the surface, we are here furnished with fresh evidence, showing that strata many miles in thickness have been removed by denudation from the surface of the land.

Applying the tests to the granites of the Highlands and of Cornwall, it has been inferred that the former have originated at a greater depth than the latter. Considering the large possibilities of error in estimating the size of the microscopic cavities and bubbles, we shall probably be inclined to consider the results as but shadowy approximations; yet they may be accepted as pointing at least in the right direction. Professor Judd says: 'The grand conclusion that granite rocks could only have been formed under such great pressures as exist at great depths beneath the surface appears to be one not open to reasonable doubt.'

THE PIANO-ORGAN CASE.

'Yes, sir, I like to hear a piano-organ,' said Detective Sergeant Jones, leaning back in his chair, and having a far-off look in his eyes, as though he were gazing at a beautiful picture of the past. The sergeant was a well-set-up man of about fifty years of age, with a military look, and a pair of cavalry moustaches. 'I may say a piano-organ was the making of me,' said the detective, pursuing the thread of his remarks, suggested probably by the strains of one of those melodious

instruments, wafted on the breeze through the open window. He took a sip from his glass, and after a few puffs at his cigar, said: 'It's a long story; but if you would care to hear it, I'll give it to you.'

Receiving a ready response from me, the sergeant cleared his throat and began.

Some few years ago I was sent to examine a burglary job over Hampstead-way. The house, a small detached one, stood a little distance back from the road, and was surrounded with a large garden, enclosed by a low wall with iron railings on top. It was inhabited by a Mr and Miss Somers, quiet well-to-do people, who kept two women-servants. One of the windows on the ground-floor, opening into the garden at the rear, had been forced, and an entrance had been effected by the robbers. Some money and plate had been carried off; but the greatest loss was a valuable diamond necklace, which, apart from its worth, was a great grief to Miss Somers, as it had been her father's gift to her mother on their wedding-day. I had up the servants; but though I cross-questioned them pretty severely, I could tell from their manner that they had nothing to do with the business. They had been in the family for years, and were implicitly trusted by their mistress.

After they had left the room, and I had gathered all the information I could relative to the articles stolen, I was standing in the parlour, looking out of the window, when I heard the sound of wheels outside, and immediately after a piano-organ struck up. Where I stood, I had a good view of the road, but was hidden by a curtain from the notice of any one outside. The organ was being ground by a young Italian, with a great bushy head of black hair. Coming through the gate leading to the house was a young woman with fine dark eyes and a bold, determined, handsome face. She wore a white bodice, and a green velvet skirt, over which was a bright violet apron trimmed with yellow ribbon. A showy silk handkerchief was twisted in her hair; and in her ears were a pair of curious gold earrings of very large size, formed of hoops one within the other; and terminating in an elaborate drop.

On seeing Miss Somers, she smiled, showing a beautiful set of teeth; and holding out her hand, she waited in the garden, evidently expecting some money. Miss Somers shook her head; but as the woman didn't move off, she opened the window, and with more asperity than I should have thought her capable of, ordered the organ away. With a dark frown and a toss of her head, the Italian woman looked at the lady for a moment, then turning on her heel, strode out of the garden, banging the gate behind her. Taking hold of the strap, while the man caught up the handles, she moved away with the organ without a word.

Miss Somers threw herself in a chair, looking very shaken and upset, while her brother came to her side, seeming much concerned. After a little she broke out with: 'I shall have nothing more to say to that woman; she shall never sit to me again.' I never saw such impertinence.

This particular pair of Italians, it turned out,

were in the habit of coming two or three times a week to play; and lately, Miss Somers had made some water-colour sketches of the woman in her picturesque costume.

A few minutes after, I took my leave, promising to leave no stone unturned in the search for the stolen property. But though a large reward was offered for its recovery, no trace could be found, and so in course of time the affair came to be forgotten. This case happened in October.

In April, next year, I was again sent to the same neighbourhood, but more Hendon-way this time, to the house of an old bachelor, a retired civil-service clerk, living on a good pension, who resided in a lane near the green. The robbers in this instance were unsuccessful, having been disturbed before they had broken in. There were marks of a jemmy on one of the doors; but beyond this, no damage had been done.

The gentleman was very testy, being greatly excited by the attempt of the previous night. I tried to soothe him with the assurance that as the thieves had been frightened off, there was little fear of their trying his premises again; but not being able to calm him, I was thinking of going, when I heard the music of a piano-organ suddenly commence. The old gentleman was so highly strung, that the rattling noise was just the last straw. He jumped about like one demented, abused all street musicians in good round terms, and at last, his temper boiling over, he danced out of the house, and going up to the player, shook his fist in his face, and, in a voice hoarse with passion, ordered him off. A policeman coming up at that instant made short work of the matter by giving an unceremonious shove to the instrument and sending it away in double-quick time. After wishing the gentleman good-day, I walked briskly down the lane, and soon came up with the organ, which was being dragged by the identical pair of Italians I had seen the autumn before at Hampstead. It struck me as being a strange coincidence that these people should crop up on both of my professional visits to that part of the suburbs. Making inquiries in London, I discovered that they were man and wife—by name Carlo and Rosa Audrealotti, living near Eyre Street Hill, Hatton Garden. They were reputed to be very respectable, and were rather looked up to in the hive of a house in which they lodged, as they did not pig in with the other people at supper in the kitchen, but kept themselves in select reserve in their own apartment, a back-parlour. Their organ was their own, and was wheeled every night into their room for safety. As they were supposed to entertain dangerous republican notions, they were rather shunned by their fellow-lodgers. Still, nothing of a criminal character could be ascertained about them, so they were left alone by the police.

Another robbery occurring soon after in the same neighbourhood, I was sent on special duty to skulk about the district. You might not guess what disguise I adopted, sir. Well, I was dressed up like a chickweed and groundsel man, in a smock-frock, with a shaggy red wig on my head, and a rough beard to match. My clothes were appropriately ragged and my face dirty, and being furnished with a basket, I flatter myself I looked the part to perfection.

The next morning I started for Hendon, and being acquainted with the place, I got into the fields between there and Edgeware, and soon gathered some bunches of primroses, with which I filled my basket, and getting back among the houses, commenced to prowling about and offer my flowers for sale. After a long day's tramp without lighting on anything of consequence, I turned my face homeward and began my weary trudge back to town. When I got into the deep cut North End Road at Hampstead, I saw some people resting on the bank, but the shadow was so dark that I could not tell who they were till close upon them, when I at once recognised the Italians with the piano-organ. The young fellow was sitting in a dejected way, looking weakly at his wife, who seemed to be laying down the law pretty strongly, though, of course, I could not understand what she said. On my approach, she stopped short; and the man, evidently glad of the interruption, wished me good-night in broken English. I tried to get into conversation with him; but the woman appeared very unwilling to have anything to do with me, for she started up, and catching hold of the organ, with the help of her husband, who was quite under her thumb, commenced pulling away towards London at a rapid rate. As it did not fit in with my assumed character of an old flower-seller to be too spry in my motions, I was soon left behind.

A day or two after, as I was plodding along the road, I was passed by the same pair of musicians, and on my wishing the man good-morning, the woman as before went on, not saying anything to me. Several other times I met them either going or returning, and I was struck with their powers of endurance in dragging such a heavy load all those miles and up the long hills on the way.

One morning, coming from the fields with some cowslips, I came upon them outside a large substantial old house. The man was grinding away, and the woman was going in at the garden gate. I was in the act of lighting my short cutty pipe, when the man asked me for a match, though he didn't light up then, as not looking business-like, I suppose. Setting down my basket, I tried to have a little talk with him; but his English was so bad that I couldn't make out much of what he said. While I was at this game, the woman returned, and did not seem pleased to see us together. She looked sulkily at me under her black brows, and gave an impatient stamp with her foot upon the road, making one think what a handsome spitfire she was in her gay costume. Not wishing to be blown up by her, I shouldered my basket and moved away, leaving her rating her companion soundly. I could not imagine what made her take such a dislike to me, as I had always been civil.

For some time after this the district was not visited by burglars, and I was beginning to think of being recalled from my wearisome duty, when one morning before starting I was sent for to the office and instructed to go to Hendon in private clothes, as a house there had been broken into on the previous night.

On arriving, I found it to be the house in front of which I had given the organ-grinder the match and had aroused his wife's anger. A large garden,

shut in with a high wall, separated it from the road, while in the rear the grounds sloped down to the river Brent. The thieves had got into one of the bedrooms by means of a ladder from a neighbouring stackyard; and they had carried off a large booty, principally jewels. The robbery was not discovered till a late hour, when one of the maids going up to light the gas in the room, found the door locked on the inside. She at once gave the alarm; but the thieves had evidently taken their departure some time before, for no trace of them could be discovered, though a strict search was made all round.

I examined the place, and found the job had been done in a thoroughly workman-like manner, and was on the point of leaving with my report, when my eye caught the gleam of something bright under the window-curtain. Stooping down, I picked up a large foreign-looking earring, which I immediately recognised as one of those worn by the Italian woman with the piano-organ. This put me at once on the scent, and explained why my two friends so haunted the district. But the thing was to pounce upon them before they had any suspicion of being wanted; otherwise, there was little chance of recovering the jewels, for I made up my mind that it could be no other than they who had stolen the diamonds from Hampstead. I did not mention my find to the gentleman of the house, as one cannot be too cautious in these matters.

Knowing the Italians would be by this time on their round, I returned to town, and after a consultation with my superior, determined to drop upon my pair the next morning before they began business.

I don't know, sir, if you are acquainted with the Italian quarter near Hatton Garden. It's a queer place, chokeful of those black-haired ice-men, *pifferari* bagpipers, organ-grinders, and artists' models. The names on the shops are all foreign; the streets are crowded from morning till night, and the bright dresses of the women are in great contrast to the dingy houses.

When I made my way there early the following morning, accompanied by another officer, also in plain clothes, most of the inhabitants were already stirring, busy preparing for the day's campaign. Some were mixing their ice in tubs, stirring the mixture with great pieces of wood, and some were going off with their cargo complete. On reaching the house where my couple lodged, we were confronted in the doorway by a stout dirty-looking Italian who was the landlord—the *padrone*, I think they call him. We stated as our business that we wished to speak to Carlo Andreolotti. The fat man looked at us suspiciously, as though guessing something was wrong; but seeming not to wish to be uncivil, he tapped at the door of the back-parlour, and getting no answer, he tried the handle, but found the room locked, so told us Carlo must be out already on his round. Leaving another officer to watch the neighbourhood, we started on our search, hoping to overtake the musicians.

Finding, by inquiry of constables on the road, that they were before us on their usual route towards Hampstead, we hailed a cab, and presently saw our quarry jogging along with their organ through Kentish Town. We stopped the cab, and getting out, stepped up to the Italian, whom I

tapped on the shoulder, bringing him to a standstill. The woman at first appeared inclined to run; but on second thoughts, she remained quiet, putting on an air of injured innocence. We had no great difficulty in getting them to a police station, where I charged them with being concerned in the burglary at Hendon two nights before. The woman, who took it much more coolly than her husband, said we should all rue the insult put upon her, speaking in very decent English. I noticed that she wore another pair of earrings, which were much plainer and smaller than those I had always before seen her with. After the two were disposed of for the time, the piano-organ was wheeled into the station yard and locked up in a shed.

Getting a search-warrant, my friend and I went to the lodgings near Hatton Garden. The landlord at first demurred about letting us go into the room; but on showing our authority, he made no further bother. As the parlour was locked, we had to force open the door. The room into which we broke was a large old-fashioned apartment, very dirty, the ceiling black with age. There was little in it beside a deal table, decidedly in want of scrubbing, a couple of broken chairs, and in one corner of the floor a mattress and a blanket or two. We looked eagerly into a cupboard, but found only a few cups and basins, some macaroni in a dish, and a rusty old lamp. Though we examined the place thoroughly, we could find nothing else but dirt; so, terribly disappointed, we at last gave up the search.

On going out of the room, we were met in the passage by a crowd of Italians, who had evidently been looking through the keyhole during our hunt. They made way for us to pass, but kept up a chorus of what seemed to me uncomplimentary remarks.

When we got into the street I felt rather at a loss how to proceed, for I had only the earring and my suspicions to go upon, and was quite at sea as to the whereabouts of the jewels. Taking leave of my companion, as he had another engagement, I walked moodily and out of spirits to the police station where my Italians were locked up.

All at once it struck me that I might as well have a look at the piano-organ, so, getting the key of the shed from the inspector in charge, I proceeded to examine it. It was an ordinary-looking instrument on a low truck, with a box near the handles. This contained nothing of consequence, so I took off the waterproof cover and carefully inspected the case, but could find nothing unusual about it. I was shaking my head over my want of success, when I happened to notice that the green baize which covered the back was rather loose, and that some of the tacks which fastened it to the frame were missing. Something impelled me to look behind it; so, taking hold of one corner of the baize, I gave it a smart pull, and it came away easily from the woodwork for a foot or more from the bottom, exposing a deal panel. I rapped this with my knuckles, on which it gave out a hollow sound; so, going on my knees, to get more readily at it, I pulled out a knife, and commenced prising at the panel. At that moment the inspector came into the shed, and seeing me busy, asked if I had found anything. I succeeded at length in wrenching off the piece of wood on

which I was working, and disclosed a space between it and the real back of the organ. Wheeling the instrument to the light in the doorway, the inspector and I looked inquisitively into the cavity, and discovered a small parcel wrapped in a handkerchief. With trembling hands I unfolded this, and also a piece of cotton-wool inside, and disclosed a number of brooches, rings, and bracelets, evidently of great value, and a diamond necklace, which I knew from description to be the one stolen from Hampstead.

This lucky find did the business for the Italians, who were committed for trial at the next sessions. When the day came and the case began, it was astonishing to note the difference in the bearing of the two prisoners. The woman looked defiantly about her, while her husband appeared quite crushed. At the close of the speech for the prosecution he broke down altogether, and then and there made a full confession, throwing all the blame on his wife. He said they had committed the robberies with which they were charged, but that he acted completely under his wife's direction, as she planned the affairs, and was foremost in carrying them out. They had arranged, as soon as the last business had blown over, to dispose of the jewelry abroad, and afterwards to settle down quietly in Italy. Of course the confession made it no lighter for the man, and both the prisoners were sentenced to a long term of penal servitude.

I came in for a good deal of praise for my share in the matter, and, what was much better for me, got promoted. Though, as a member of the force, I was not entitled to claim the reward offered for the recovery of the diamonds, yet Miss Somers was so delighted to get them back, that she made me a handsome present. Ever since then, I've had a liking for piano-organs.

A SUBMARINE BRIDGE.

A proposal recently brought forward by Herr Rudolf Lilljeqvist, a Swedish engineer, for effecting permanent railway communication between Sweden and Copenhagen, merits some notice, as introducing a new mode—never as yet, however, put to the test of actual experience—of carrying a line beneath the sea.

The distance between Elsinore and Helsingborg is about two and a half miles; and the passage is frequently blocked in winter by ice preventing navigation. The cost of an ordinary bridge, which would of necessity have to be carried sufficiently high above sea-level to offer no impediment to vessels, would be prohibitive in a country but sparsely populated and of limited financial resources; whilst the additional strength requisite in the piers to withstand damage to the structure from the floating blocks of ice would add very materially to the estimates.

The proposal put forward is to construct an ordinary girder-bridge of one hundred feet spans, and sink it to such a depth that ample room is left for vessels of the greatest draught to sail over it; the bridge being encased in cylindrical tubes, which exclude the water; the outer skin of the tube being of iron, that inside of steel, the space between being filled with concrete. The tubes enclosing the bridge are to be carried on ordinary caisson piers filled with concrete and spaced

one hundred feet apart, pontoons similar to those so successfully employed in the construction of the Tay Bridge being adopted for founding.

The bridge, which is to carry a single line of railway, with foundation and encasing tubes, but exclusive of the land approaches, is estimated to cost about three-quarters of a million sterling.

The scheme may be described as an ingenious compromise between an ordinary bridge and a tunnel; and it is claimed that it combines the advantages of each, whilst avoiding the attendant drawbacks to the construction, and heavy outlay involved in the execution of either in this particular case.

The general idea, it may be added, is not altogether novel, and has previously been mooted; indeed, some years back a similar method of passing under the Thames was proposed and commenced, some lengths of the encasing tube being actually put in hand. The project, however, was abandoned, owing, it is understood, to financial difficulties, and has never been resuscitated.

THE DIAL'S SHADOW.

Go, Cupid; say to her I love

That roses fall and time is fleeting.

I watch the dial's shadow move,

And wait—and wait—to give her greeting.

For youth is sunshine on the dial,

And love is but an old, old story;

The years may dance with lute and viol—

The shadow moves—so ends their glory!

Go, Cupid, beckon with your wing,

That sweetest chance may waft her hither;

For we must woo, remembering

How fast the roses fall and wither.

And oft the dial long ago,

The pavement sunk with mossy edges,

Saw Youth and Love meet all aglow,

And whisper by the old yew-hedges.

Go, Cupid, tell the maid I prize

How many in the courtyard wandered,

What laughing lips and witching eyes,

In love's delight their beauty squandered!

The ruffs, brocade, and buckled shoes,

How softly down the paths they pattered

With gallants gay in old-world hues,

When crowns and kingdoms little mattered.

Go, Cupid, sleep; your cheek is pale;

And we can woo among the sages;

Romance is but a weary tale

Monotonous from all the ages.

My heart! She comes from yonder door;

And time and shadows flit for ever;

Why, there was never youth before,

And love like ours, oh, never—never!

C A S T E.

ANY one who gives attention to the subject of Totemism, about which we recently wrote, must be struck with a certain analogy which exists between that ancient and curious custom and the institution of Caste. We propose, therefore, to say a few words about the latter.

Although the word caste is a comparatively modern one, that is to say, not older than the sixteenth century—for it is taken from the term *casta*, applied by the Portuguese settlers to the classes of Hindus in India—the institution is to be traced back as far as human history extends. Plato gives us a glimpse of it in the dawn of the Athenian commonwealths, and in the five hereditary grades of priests, handicraftsmen, shepherds, ploughmen, and soldiers. Prescott found a similar division in Peru; and there is a suggestion of the same kind of thing in ancient Mexico. In the South Sea islands, at anyrate in Fiji and Tonga, there are hereditary crafts; and the totems of the Indians and the Australian aborigines may be called caste forms.

Caste is believed to have existed among the ancient Persians and among the Assyrians; but in olden times it reached its highest development in Egypt, as in modern times it has reached its highest development in India. All nations have a trace of it more or less marked, whether it be the Patrician and Plebeian of old Rome and medieval Venice, or the aristocratic 'Wholesales' and 'Retired Retails' of Clapham, who, as Mrs Caudle observes, never visit each other.

The essential characteristic of caste is that it is not a mere arbitrary division into classes, but betokens hereditary rank and social position. Its analogy with totemism rests in the limitation which it places on marriage, as we shall shortly see. In fact, a caste is as clearly defined a clan or community of people as is a totem. There is a system of caste in Madagascar, and also in Ceylon; but we will confine our attention to India, where it exists in the most highly developed and complicated form.

Totemism, as we have seen, is based partly on social, partly on political, and partly on religious foundations. Its marriage system is exogamous,—that is to say, members of a totem may not intermarry, but must seek partners in some other authorised totem. Caste as at present existing in India is partly a religious and partly a social system; but its marriage laws are endogamous—that is to say, a member of a caste must marry within the caste, or be ostracised. Sir Roper Lethbridge says that the Hindu caste can be most accurately described as a social system maintained and enforced by a strong religious sanction. 'A Hindu caste,' he says, 'consists of a number of families—sometimes of an immense number of families—scattered about in various parts of the country, some very poor, and others very rich, but all presumably more or less nearly related to each other, and all governed by the same rules as regards marriage and all other religious and social observances. Caste-fellows alone—with very few insignificant exceptions—can eat together, or enjoy the close social intimacy that in other communities sometimes exists between friendly families. On the other hand, the caste rules are absolutely binding on all members of the caste, and the wretched man who breaks these rules and is expelled from his caste becomes a person without a friend or an associate in the world, a social felon, for no other caste—not even the lowest—will receive him.'

The Hindu caste system is based on the Laws of Mann, the son of Brahma. Those Institutes are said to embrace all that relates to human life, the history of the world and of man, the nature of God and of evil spirits, and a complete system of morals, government, and religion. This comprises, as Sir William Jones has said, a system of despotism and priesthood, yet distinguished withal by the remarkable rigour and purity of its morals. The close resemblance of many of the maxims to the precepts of Christianity has been noted not merely in the style of thought but also in the actual form of expression.

But what we are concerned with just now is the

feature in the Laws of Manu which bears on the caste system. In these Laws, four distinct castes are defined: (1) The Brahmans, or priest caste, for whom and whose good it came to be thought that all other persons and things were made. (2) The Kshatriya, or military caste. (3) The Vaisya, or industrial caste; and (4), the Sudra, or servile caste. The first three were called also the 'Twice-born,' and all three were distinguished for the contempt and hatred with which they regarded the lowest or Sudra caste. Both the military and the industrial castes are now practically extinct.

What is to be seen in India to-day is a vast confusion of castes, due to the lowering of some, the raising of others, the intermixture of the higher castes, and the creation of innumerable new divisions. The present Hindu custom, however, forbids absolutely marriage between persons of the same *gotra*, or kindred, and technically between persons of different castes.

The Brahmans are now divided into ten great sects; but there are many more distinctions among them. The Rajputs now number five hundred and ninety separate tribes in different parts of India. The descendants of the old industrial caste are no longer confined to husbandry, but are the merchants and bankers of the country. The Sudras alone retain their original position of degradation.

'There is,' Sir William Hunter observes, 'a plasticity as well as a rigidity in caste. Its plasticity has enabled caste to adapt itself to widely separated stages of social progress, and to incorporate the various ethnical elements which make up the Indian people. Its rigidity has given strength and permanence to the corporate body thus formed. Hinduism is internally loosely coherent, but it has great powers of resistance to external pressure. Each caste is to some extent a trade guild, a mutual assurance society, and a religious sect. As a trade-union it insists on the proper training of the youth of its craft, regulates the wages of its members, deals with trade delinquents, and promotes good-fellowship by social gatherings. The famous fabrics of mediæval India, and the chief local industries in our own day, were developed under the supervision of caste or trade guilds of this sort. Such guilds may still be found in many parts of India, but not always with the same complete development.'

Still, the trade guilds of the cities and the village communities throughout the country act, with caste, as mutual assurance societies, and virtually take the place of a poor-law system in India, for they allow none of their number to starve if help be within their power.

There are both rewards and punishments in caste. If a man behaves well, he may rise to an honoured post in his order. If he offends its rules, he may be punished in various ways, and for grievous offences may be excommunicated. This last punishment is threefold. It debars the man from eating with the members of his caste; it interdicts him from marriage within the caste, and as he cannot marry in any other, it shuts him up from respectable marriage of any kind; and it cuts him off from the services of the barber, the washerman, and other tradespeople of the community, as well as from those of the priest. He may be taken back again on pay-

ment of a fine and after proper purification; or he may be compelled to remain an outcast all his life.

There is only one thing which all the castes possess alike in common—this is the tuft of hair on the crown of the head, which is the 'index of Hinduism,' and by which the wearer is to be raised to heaven. But the three great castes have also 'the sacred cord' to distinguish them, which is bestowed in the eighth year upon a Brahman, in the eleventh year upon a Kshatriya, and in the twelfth year upon a Vaisya.

All Brahmans are not priests, but all priests are Brahmans. This caste claims the most exalted attributes, and according to the Manu scripture, is superior to law, even to moral law, when it interferes with his interests. A Brahman may not live as a hired servant, but he may take the property of a Sudra. A proper gift to a Brahman on a deathbed, will, it is said, secure heaven to a malefactor; and the Brahman who receives a present from a member of another caste confers a favour on the donor. The exaggerated honours originally allowed to the Brahmans are no longer allowed except among the lowest orders; yet the Brahman still retains a sort of sacred character, and is regarded with admiration, if not with veneration, by the other castes. In theory, at any rate, he retains his supremacy; and there are parts of India still where low-caste people account it an honour to take the dust off the feet of a Brahman and to place it on their heads, and even to drink the water in which the feet of the Twice-born have been washed.

But there are degrees of sanctity and grades of rank even among the select Brahmans, for there are some twenty-five sects of this privileged caste. The Brahmans of Mysore, for instance, look down with contempt upon the Brahmans of Benares. Some of their subdivisions will not eat or intermarry with the members of other subdivisions; and others again, notably in Calcutta, quite openly violate the laws of their order. For instance, they are forbidden in the sacred writings to eat beef, drink wine, wear shoes made of cow-hide, or sit down to table with men of inferior caste, or of no caste at all like Europeans. Yet many eminent Brahman gentlemen in the cities now do all these things without losing, as they would once have done, their place in Hindu society. Then, again, in the old days, young men who went to visit foreign countries and ventured to England had to subject themselves to severe penance before they could be reinstated in their caste; but now, in most of the Brahman sects, a Hindu may do pretty much as he pleases short of receiving Christian baptism. Of course that ostracises him at once.

We have said that all Brahmans are not priests, and also that, according to the Laws of Manu, no Brahman can be a hired servant. Yet, as a matter of fact, they are to be found occupying positions as clerks, schoolmasters, physicians, engineers, and shopkeepers, &c. But while the caste-wall has thus far been broken down, there is less intermarriage between the castes than there was in the days of Manu. The reason is that the punishment fell upon the children, but now it falls upon the offenders themselves.

According to the census of 1881, there were about one hundred different castes in Bengal alone.

In all India there were 10,546,735 Brahmans, 5,788,735 Rajputs (or Kshatriyas), and 128,540,380 of the miscellaneous and mixed castes. To come back to Bengal—we learn from the Census Report that there are thirty castes which are represented in every province and in every village. To run over these will give a sufficient idea of the ramifications of the system.

The Brahman, of course, must be found wherever there is a temple; and the Rajput will be found in secular alliance with the service. Then, wherever there are a few houses clustered together will be found the Banirja, or money-lender. The Teli caste supplies the oilman, and the Barbi the carpenter, without which no village can get along. The cobbler, who also skins the carcasses of the cattle, is a Chamar; the washerman is a Dhobi; the barber is a Napit; and the scavenger is a Dom. Besides these castes are represented, Karnakar, the blacksmith; Kumbhar, the potter; Madak and Kandu, the confectioners, who make up the farinaceous food of the people; Sunri, the wine-seller; Barni and Tamoli, who prepare and sell the pan-leaf and betel-nut; Tanti and Jugi, weavers; and Mali, the flower and vegetable dealer. These are the artisans of the community; and the agriculturists are Kaibarthas; the cow-keepers are Gwalla; the boatmen are Mallah; and the fishermen are Tevi. Intercommunication rests with the Kahar, or palkie-bearers. Learning is the province of the Kayastha, who furnish the schoolmaster, the village accountant, and the landlord's secretary or clerk. The day-labourers and field-hands are Bhuiinyas and Khawars.

The most respectable families of Calcutta belong to the Pir Ali subdivision of the Brahmans; and the origin of this sub-caste is thus related by Mr Wilkins: 'Years ago, one of their ancestors went to the house of a Mussulman law officer, where a trick was played upon him. The Mussulman had heard it said that "to smell food was half-eating it;" and in the wish to convert some of the Brahmans in his neighbourhood, he invited them to his house, and whilst they were seated there, he ordered his dinner to be served. They smelt the food, and their caste was gone—so it was decided. Some of them became Mussulmans; but one, who preferred to remain a Hindu, though his caste was injured, became the founder of another class, called the Pir Ali, after the man who had played the trick upon him.'

That caste is still regarded as a divine institution by the lower orders is, of course, well known; and the strictly orthodox will prefer death to eating forbidden food or doing anything contrary to the tenets of their particular caste. The result is one involving great expense and inconvenience to Europeans, who are obliged to have a great number of servants for the different departments of domestic arrangements. Thus, if a low-caste servant brings a letter or anything, the superior-caste servant will not take it from his hands or touch it simultaneously with him: it must be laid on the ground and taken up thence by the superior one. In fact, the orthodox Hindu will not join in any work whatever in which Sweepers or low-caste men are employed. No doubt, however, caste difficulties are often conveniently interposed when a man doesn't want to do something which is asked of him.

The Caste system is the great obstacle to the

material progress of the country. Until it is broken down, India can never take her rightful place among the nations, for she cannot be a nation in the true sense of the term. Like totemism, in short, Caste is a relic of barbarism, but also an evolution of barbarism struggling towards light. Both systems have had their uses, and both systems have left their marks, even in the most civilised and enlightened communities.

JOHN VALE'S GUARDIAN.

CHAPTER XXXV.

ONE fine afternoon Cecilia had put on her bonnet and was leaving the house by the front door, when her father presented himself at the gate and barred her egress for the moment. They were not on as perfect terms of friendship as they had used to be, and the girl knew that her father watched her outgoings and incomings with a suspicious jealousy. So, when he cocked his eye at her with a marked aspect of inquiry, as careful robins eye the deliver's toil, Cecilia blushed faintly, not because she was thinking anything at that moment of the forbidden theme, but because she read the suspicion of her father's look. The farmer thought the blush ominous, understanding very little of woman, and spoke his mind straight-way.

'Where are you going to?' he opened gruffly.

'Mrs Day was here last night,' began Cecilia, rather tremulously.

'I didn't ask you who was here last night,' returned her father, 'nor who wasn't here last night. I asked you where you was going to.'

'I was going to tell you, father,' Cecilia responded meekly. 'Mrs Day was here yesterday, and told me that poor little Lydia has been very unwell, and I promised to go up this afternoon and see her.'

'Ah!' said the farmer; 'and I suppose you're none the slacker in going because 'Zaiah Winter lives close by?—Look here, Cecilia; it's not a bit o' good you letting your mouth water over that young Frenchman. You'll never get him to a husband as long as I'm alive.—Now, don't tell me. I know the meaning of them bits of ribbon and them pretty gloves. Lures to catch geese, they be.'

'Father!' cried Cecilia, on the point of tears, 'you are very cruel. I wonder how you can find the heart to say such things. You used not to be like this.'

'No,' said Shorthouse; 'I have been a fool i' my time, to be sure. I used not to be like this, nor anything like it; but I'm like it now, and I'm going to continue like it, and that you may mek up your mind to.'

At this Cecilia began to cry outright and to mop her pretty eyes with her handkerchief.

'My wench,' said papa, a little mollified by the sign of his own victory, as he construed it, 'I'm about as much notion of being a cruel father to thee as I have o' cuttin' my own nose off. Thee knowest that as well as I can tell thee. But I'm

a long way off from bein' blind yet, and I've seen the pair on ye makin' eyes at one another—in church, above all places in the world! Now, that's a thing as I'm determined to mek a hend of. Understand me now. I'll have no carryings-on wi' that young foreigner; and to put it in a word, I forbid you to speak to him.'

'If he speaks to me, father,' sobbed Cecilia.

'If he speaks to thee,' said Shorthouse, 'thee canst give him a civil good-mornin', or a civil good-hafternoon or hevenin', as the case may be.—Now I've spoke my mind in the matter, and I look to have to say no more about it. Theer's nothin' to cry about, as far as I can see; but afore you go out, I want your promise. Will you do as I tell you?'

'Yes, father,' said the unfortunate Cecilia.

'That's all right,' said the farmer; 'and now, thee canst dry thine eyes and go about thy business.'

He walked into the house secure of victory, and left Cecilia still crying a little on the garden path. Perhaps Cecilia did not take him quite *au grand sérieux*. Perhaps she relied vaguely on time, or firmly on her lover to bring about some change in the aspect of affairs. Perhaps she was even undutiful enough to have a mind of her own in the matter. Anyway, it is certain that in less time than might have been expected she had dried her eyes, and that in a little while she was walking towards Farmer Day's new house with a decidedly resolute step, and an occasional carriage of the figure which betokened at least an inclination towards resistance.

The child's indisposition would have seemed to be anything but serious, for she was already planted in a wicker armchair on the lawn in front of the house. She wore a cottage bonnet, and was shaded from the sun by a high privet hedge. She had been trying to cut out patterns from a sheet of white paper, but now lay back in her chair rather listlessly, with the instruments proper to that undertaking in her lap. Cecilia kissed the child, and kneeling by her, strove for a little while to draw her into conversation; but whether the small patient were languid or perverse, or simply disinclined to talk, as more elderly invalids might have been, the girl had no success with her, and in a while entered the house to make a call of friendly ceremony upon Mrs Day. That good woman had entered into rivalry with the wife of her husband's partner, and would not allow Mrs Isaiah Winter to own anything of which she herself had not a *replica*. She was a person of no originality, and being compelled, therefore, to follow Mrs Isaiah's lead, had contrived to make the two houses so alike that a visitor might well have mistaken one for the other. In each establishment there was the same glacial show of unwrinkled horsehair, the same shiny mahogany legs to the table, the same brass-bound, brass-knobbed mahogany chests of drawers, the same all-pervading odour of French-polish. Mrs Day carried her rivalry further, and dressed after Mrs Winter, with this difference, that what the latter lady wore only on occasions of ceremonial, the former sported always of an afternoon; and at any time after the one o'clock dinner, Mrs Day's black silk was in evidence to prove to the haphazard caller that its wearer had become a lady.

The odour of the French-polish was a little overmastering, in spite of the fact that the windows of the best parlour were open on the little lawn, whence there flowed in a far more agreeable perfume of rose and honeysuckle and wholesome country air. Cecilia sat near the window, almost within hand's-reach of the child on the lawn below, and there talked uninteresting nothings with feminine vivacity with the mistress of the house. Suddenly she heard a click at the outer gate, and then a voice from the garden seemed to send all her blood to her heart.

'Ala!' said Jousserau—for of course his was the only voice which could so have disturbed her—the leetle Lydia!—the poor leetle Lydia. She has not been well. Oh, that is too plain to see. Where is it, the pretty red that was in the cheeks? We must have it back again, the pretty red. We must have it back quickly.—You will give me a kiss?—No? That is for that I smell of cigarettes.—What do we do here? We cut shapies from paper? Oh, that is where I am clever; that is where I am at my best. Now you shall see what you shall see.'

Cecilia, with a fluttering heart, peeped round the curtain, drawing it aside by a mere fraction of an inch with a gloved finger-tip. Jousserau had seated himself on the dry smooth turf beside the child's chair, and with that bright and charming smile which became him so sweetly to the watcher's eyes, was holding out his hand for the scoured sheets of paper which lay in Lydia's lap. The young patient was interested already, and with parted lips and solemn eyes she handed the sheets to her companion.

'Ah!' said Jousserau, rejecting the scissors the child proffered, 'when one is great artist he must have fine tools. I shall use my own scissors.—There! Saw you ever any like these?' He took from his pocket a pair of folding scissors in a small morocco sheath. These he opened and adjusted before Miss Lydia's wondering eyes, and having brandished them with a preliminary flourish, folded one of the sheets of paper into an intricate form, and began here and there to snip at it with an exaggerated care and delicacy, looking up at the child-patient every now and again with that swift and vivid smile.

Mrs Day, who at the moment of Jousserau's arrival had been entertaining her guest with a discourse on the value of the herb hoarhound, sunk her voice to a confidential whisper at his coming; and Cecilia, who nodded now and again, and now and again raised her eyebrows, seemed to make a most excellent listener, though she heard not a single word with understanding. Through the little crevice between the blind and the window-frame she kept a constant lookout on her sweetheart, who, having cut and snipped away with great industry for a minute or two, now began delicately to unfold the paper. There upon it was a tree and a church spire and a goose or other bird of abnormal proportions, dominating the horizon, and a small boy behind the bird holding his arms in the air. That this wonder might be observed the better, Jousserau took off the black soft felt hat he wore and laid the filigree-work against it. The patient clapped her tiny hands together with a laugh.

'Dear me!' cried the mother withindoors,

'there's our Lydia a-laughin', I declare!' She moved to the window to see what had provoked the child's outbreak of merriment.—'Come here, my dear,' she cried, 'and see what Mr Jousserong's cut out of paper to please the child.'

'Sh!' said Cecilia, raising a finger to her lips and assuming a frown of warning.

Jousserau looked up at Mrs Day, and nodded to her in salutation. 'She wants to be inter-ested,' he said, nodding again towards Lydia.—'Look! She has her roses back already.'

'I've been trying to cut a pig,' said the child poutingly. 'Can you cut a pig? This is nothing like it.' She held up an ill-shaped barrel on two pegs, with a curved spout, probably meant to represent the porker's tail, projecting from one end. Jousserau took his orders gravely, and carved the required object with so much dexterity that the child shrieked applause.

'What is it, my dear?' asked Mrs Day, approaching her visitor and speaking in a covert whisper. 'Don't you want the young man to know you're here?'

'No,' said Cecilia, in great distress at the question. 'He mustn't know. Oh, please, don't ask me anything.'

The hostess's face was full of questions, and Cecilia saw it; but she had misread her woman very much indeed if she supposed that any mere plea for silence would persuade her to stifle her curiosity.

'Why, my darlin', whispered Mrs Day, who had as good a nose for romance as any of her neighbours, and was ready to scent a love-affair anywhere, 'I thought you'd got quite a kindness for the young man. It's true as he's a foreigner, but that's a thing as he can't help—for none on us can choose wer birthplace, nor yet wer parents, or else we might be kings and queens o' England and Great Britain, the wull lot o' us; which 'ud be clean against the meaning o' Providence, because some must command and some obey. There's 'Zaiah Winter, always in a state o' wonderment about the cleverness in the young Frenchman's fingers. 'Zaiah's always been a truthful man; and seeing as he's now my husband's partner, I should be loth to say a word agen him; but yet there's hardly any believing the tales he tells about the money that young man can earn. For my own part, I don't see no harm in foreigners; if it wasn't proper as there should be foreigners, the Lord wouldn't allow 'em; and therefor, my darlin', to talk agen 'em is a-flying in the face o' Providence, which is a thing I never could abide.'

'Isn't there a back-way from the house?' Cecilia asked, in growing distress at Mrs Day's open innuendoes. 'Can't I get away without his seeing me?'

'No; that indeed you can't, my dear,' Mrs Day returned. 'Nor yet do I see why you should do so neither. The young man don't bite, I reckon; and a virtuous and right-minded female can always be her own protection. The young man won't stop long a-talking to a infant like our Lydia; though I must say he's got a rare kind heart, and a face like sunshine, though his complexion's swarthy. I'm told as it's the sun as does that, which is a thing as stands to nature; for I've seen our John that burnt after three days in the harvest-field you wouldn't know

him, with the skin on the tip o' his nose wrinkled up like shavings, or like the hend o' a young bit o' celery.'

'I must stay till he goes,' said Cecilia. Then, not because she was an atom more deceptive than her sex commonly is, but in mere maidenly instinct of self-protection: 'You mustn't think there's anything between us, Mrs Day; but my father doesn't like Mr Jousserau, and he has told me not to speak to him.'

'Oh, drat these men!' cried the elder woman; 'they've come to the bottom o' my patience years ago. A man as has got no grown-up experienced woman to manage him, like your father, and to fettle him up as he ought to be fettled, why, his head gets to be like a parlour as is never sweep', as full of spider-webs as it can hold.'

The good woman pumped Cecilia in emphatic inquiry, and Cecilia answered evasively, or answered not at all. All the while Jousserau had been chattering in his simple halting English to the child, and Cecilia had better ears for his good-humoured and amiable nonsense than she had for nonsense of another sort. The artist's very voice had suddenly grown dear to her, and to hear him speak was a pleasure. This was the first result of her father's British wisdom of outspokenness; and if that capable farmer and excellent man had only known as much as his daughter could have told him, he might have adopted a different method with her. The course of true love never did run smooth, and the laughter-loving deity who presides over the affairs of courtship may well take pride in the truth of the adage. The seeming unattainable is always the desirable. Bluntly to say, 'You shall not have,' is with ninety folk in a hundred equivalent to saying, 'You shall desire.' The thing given never looks so worth having as the thing withheld.

'All the paper is gone,' said Jousserau; 'and here, this is quite a garden of hearts. He is a good elephant.—What? See his curled trunk and his one leg in the air. The tail of the pig does curl as nice as his best friend could desire that it should curl.—Ah! you are sad again and tired again. Now you should not be sad or tired. If I had my fiddle, I would play to you, and you should sing a little. You sing so very pretty, my nice child.—Not? But my poor fiddle—he is miles and miles away.'

'There is grandfather's fiddle in the house,' said the child with a new eagerness. 'I should like to hear some music.—Do you know new tunes?'

'Yes, yes,' said the kindly little man; 'and old tunes that you do not know. Shall I play to you? That will be pleasure to me. I have not played this long while.—Here is mamma again at the window.—Shall I play, Madame Day, for your leetle girl? She says to me that there is in the house a fiddle.'

'I'll hand it out to you this minute,' said Mrs Day, in spite of Cecilia's beseeching gestures, which she feigned not to see.

Two or three minutes later, Jousserau was playing old Provencal airs, and the little Lydia's bird-like voice was roaring excitedly in repetition of them.

'Mother,' cried the child suddenly, 'make Cecilia come. She likes to hear me sing. I will sing her a new tune. Make Cecilia come.'

The mother frowned, winked, and nodded; and

these signs made Jousserau's mere guess a certainty. 'Mees Shorthouse is here?' he said, rising from his seat upon the turf.

'Yes,' responded Mrs Day; 'but we're busy talkin', and you mustn't interfere with us.—Go on with your music.'

'I must go,' said Cecilia, whispering from behind the blind; 'I must go at once.'

She ran precipitately from the parlour, but hesitated in the hall. Jousserau, by some fine lover's instinct, caught the rustle of her dress, and differentiating it from all other possible rustles of all other possible dresses, handed the bow and the violin to the child, and walked to the flight of well-whitened steps which led to the doorway. There he saw her, shrinking and blushing in the hall.

'Good afternoon, Mees Shorthouse,' he said humbly, raising his hat as he spoke.

She found a sudden courage, and ran nimbly down the steps. 'Good afternoon, Mr Jousserau,' she said. 'I am going home.'

'I have business that way,' Jousserau responded. There was no actual deceit in this, though he made his business on the spur of the moment, and it was neither more nor less than to walk with Cecilia.

'Good afternoon, Mr Jousserau,' she said, stammering and blushing and holding out her hand. 'I must go at once.'

'Pardon!' he said. 'There is something the matter.'

Her flushing cheek, her fluttering bosom, and the humid eyes which for a mere second begged him not to think unkindly of her, seemed suddenly to speak the truth to him.

'Permit,' he said, 'that I go no more than twenty yards with you.'

She, answering nothing, but suddenly turning pale and beginning to tremble, he opened the gate and stood hat in hand for her to pass. Then he followed her into the lane and took a place at her side.

'Am I an impertinent,' he asked, 'if I guess what has arrived?'

'Pray, let me go, Mr Jousserau,' Cecilia pleaded—'let me go alone.' Her eyes spoke differently, if ever eyes spoke in the world. 'Do not think ill of me.'

'I have not very well understood your father,' said the little man, bracing himself at last; 'but from what he has said to me, I have stayed from your house. Has he told you now that I am not to speak to you—that you are not to speak to me?'

'Yes,' said Cecilia, with the same beseeching look. 'I cannot help it.—Pray, come no farther.'

'Mees Shorthouse,' said Jousserau, baring his head once more and speaking slowly, but with a resolute though tremulous voice, 'obedience to a parent is a sacred duty to a child. I will say nothing, not one word to change you. If you say to me, "Go away, and do not seek to change my father's mind," I will go away, and you shall see me never more. But if you do not tell me that—I will—I must—do what I can to change it. May I try?'

Cecilia said not a word, but looked at him half in despair and half in hope, and altogether in a girlish shyness and confusion.

'I will try if you do not tell me no,' he said.

He held out his hand, and she took it in her own for an instant with downcast eyes; then without a word she moved away.

'That is "Yes,"' said Jousserau.

HOW ANIMALS ARE STUFFED.

THE art of taxidermy, since its invention—or perhaps it would be more correct to say its restoration—one hundred and fifty years ago, has made such considerable advance, while its details are so little known to the general public, that perhaps a few particulars concerning it may not be devoid of interest.

We will suppose that a snake has been sent to the taxidermist to be stuffed and mounted. In former times, snakes were commonly skinned by the operator making an incision in the skin of the stomach; but this method is now confined to the treatment of the larger reptiles. In dealing with small snakes, the taxidermist opens the reptile's mouth, and, with a pointed pair of scissors, cuts downwards as far as possible, taking care not to push the scissors through the skin. When the neck is free, the cut portion is forced outwards through the mouth, and the reptile literally 'turned inside out' as far down its body as the tenacity of the flesh will permit. When the end of the tail is reached, an incision becomes necessary, as it is not possible, from the inside, to detach the flesh from this portion of the animal's body. The skin is then restored, after being subjected to a preservative treatment; and the eyes having been removed, the snake-skin is ready for stuffing. This is accomplished by inserting a funnel in the reptile's mouth and pouring in dry sand or plaster of Paris sufficient to bring out the carcase to its normal rotundity. The snake is afterwards adjusted to the required position, and the head properly modelled with clay or plaster. Large snakes such as boas are skinned in the old fashion, and sawdust substituted for sand-stuffing.

In dealing with fish, a more elaborate and tedious process is necessary. The interior of the fish having been removed, a thick piece of looped wire is prepared, and this, with a couple of supplementary wires, forms an excellent substitute for a backbone. The wire having been wrapped round with paper and the framework padded out with tow until it resembles as nearly as possible the shape which it is intended to imitate, the skin of the fish is brought over the wire and the edges sewn neatly together. The shape is afterwards perfected by adding pieces of tow where requisite, and filling out with sawdust or bran. The fish is then arranged neatly on its showboard, and the outside of the skin treated with a carbolic preparation. After remaining for a month or so to dry, the skin is coloured to resemble nature, the eyes are put in, and the 'subject' having been artistically mounted and set off with water-weed, &c., the completed specimen of natural history is ready for inspection.

When large fish, such as sharks, have to be dealt with, the treatment resorted to is entirely different from that applied to piscatorial specimens of a smaller type. With the larger kinds a solidly constructed wood and iron frame is neces-

sary ; and with those of medium size—say from three to five hundredweight—an iron bar requires to be fitted into the body to secure the requisite support. The body is afterwards stuffed with hay or clean shavings until it assumes a natural shape.

Lions, tigers, and similar large animals are often mounted in England from the 'flat,' in other words, the practical taxidermist imitates the natural appearance of the animal with only his skin to work upon. There is no skeleton—the skin having probably been sent home from abroad—and the operator is required to construct a lion or tiger with only the skin of the original remaining. To accomplish this difficult task, the skin is placed on the floor, and a tracing made on paper of the necessary proportions of the 'body-board.' On this body-board are fastened a strong rod for the neck and a similar one for the tail. The ribs are imitated in wood, and laths tacked on to make the framework capable of being filled out to the necessary shape. The laths are afterwards covered with straw or plaster, and clay is finally added. The legs are modelled with the assistance of plaster, tow, and clay, the tail properly arranged, the skull, or, in its absence, the plaster head, placed in position, and the skin neatly fastened over all.

In smaller animals, such as the fox, more delicate treatment is required. The fox's skin being remarkable for its thinness, requires very careful management ; and though the operation is not so delicate as in the case of a bird, considerable care must be exercised if the 'mount' is not to be spoiled. When the flesh has been detached and the skin treated with a preservative, stuffing begins. First, the head is attended to, and tow is pushed into the cavities from which the flesh has been removed. Looped wires are inserted in the body and legs, and the natural shape filled out with tow. In stuffing such an animal as a fox the limbs require the greatest attention, as there is more 'character' to be obtained from their efficient modelling than from any other portion of the body. The shape fairly completed, the skin is sewn up, artificial eyes inserted, and the necessary finishing touches added to complete the mount.

Birds, which constitute perhaps the most numerous class of stuffed specimens, are not so easily manipulated as the unruddled character of their exterior when mounted in the conventional glass case would seem to suggest. Take a hawk, for instance. The mouth and nostrils of the bird are first filled with cotton, the flesh gradually and carefully removed from the body ; and when this has been accomplished—by a method a description of which would only be understood by the initiated—the body is stuffed with cotton or tow, the stuffing being so adjusted that the exact shape of the bird as it appeared when alive is maintained. The eyes are afterwards inserted—the eyelids having been relaxed by the application of warm water—and the bird is ready for appropriate mounting. Taxidermists differ in their choice of an artificial formation for the body of birds. The well-known naturalist, Charles Waterton, discarded wires entirely and used cotton only. Modern taxidermists, however, mount birds with wire and shape with tow. In the case of ostriches and other large birds, peat has been

found a more satisfactory stuffing than anything else.

Pages might be written on the methods resorted to to realise a resemblance to nature in other defunct animals ; but the details would probably be found too dry for the non-professional reader. One further illustration of taxidermic skill may, however, be recorded—the stuffing of an elephant. This is a task the magnitude of which is easily recognisable, the enormous size of the animal necessitating hard work as well as taxidermic skill. A good many years ago, the body of an elephant underwent the operation of stuffing in Paris, and from the recorded account, the experiment must have been an exceedingly interesting one. The elephant's corpse having been duly 'laid out,' the necessary measurements were made—the curves of the back, &c., being taken with bars of lead. The animal was then skinned, an operation which occupied several persons for four days. The skin (weighing five hundred and seventy-six pounds) was placed in a large tub and covered with powdered alum ; then a fictitious frame—a wooden elephant, in fact—was constructed, and in due time the skin was taken from the tub and placed on the frame. It was then found that the wooden elephant was too big for his clothes, as the skin would not entirely cover the frame. For four days, five persons were employed in thinning the skin ; and the shreds which they cut off—from the inside, of course—were found to weigh one hundred and ninety-four pounds. The paring process answered the purpose. This time the 'clothes' fitted, and ere long the hollow elephant looked as natural as the art of taxidermy could make him.

MRS LAMSHED'S WILL.

CHAPTER IV.

'You know what your grandmother did to-day, Kate?' her father said calmly.

'She told me she had altered her will, papa, but didn't say how.'

'Did she say nothing more about it?'

'She only said that you should never complain that she encouraged me in disobedience. I don't know what she meant, but she told us so.'

'Us?' growled Mr Dottleeson. 'Who else heard her say so?'

'Dr Lakeworth was there, papa.'

'He knows all about it,' snarled her father.

'I was in granny's room all the time he was there, but she didn't mention it to him at all.'

'I daresay not. But mark my words, Kate : there's a very good understanding between your grandmother and Mr Lakeworth.'

Kate did not feel called upon to make any reply, and Mr Dottleeson resumed. 'Since Sir Alfred took upon himself to place Mrs Lamshed in this fellow's hands, I can't prohibit his coming here ; but when your grandmother has gone, he will never see the inside of my house again.'

He had not considered that his daughter would not be aware of the old lady's condition, and only sought to impress upon her that she must dismiss Charles Lakeworth from her thoughts.

'I hope there is time enough to think about that, then, papa.'

'A few days, I believe. Sir Alfred gives her until the end of the week. To-day's Wednesday.'

His rage and disappointment had made him utterly callous, and his daughter heard him with a feeling of repulsion she had never known before. He left her before she fully realised the meaning of his words, and when it came home to her, she forgot all else in the blow which had fallen upon her. It would be a terrible loss to her. Mrs Lamshed had done much to replace the mother who had been taken from her in her infancy, and Mr Dottleson, for ever absorbed in the cares of business, had sadly neglected his duty as a father. Now the fiat had gone forth: she was to be deprived of her best friend and her lover in a few days. She could not save the first; but Kate made up her mind there and then about the second: no power on earth should separate them without Charles Lakeworth's consent, and she knew that that was not likely to be given. She would say nothing to her father for the present; it would only increase his troubles; and though she was far from feeling any sympathy with him, she shrank from adding fuel to the fire which blazed so fiercely already.

Thursday morning broke wet and windy. Mrs Lamshed was visibly sinking, and Kate could not hide from herself that even the brief span of life given by Sir Alfred was likely to be too long. Charles Lakeworth came in early, and his first glance at Kate showed him that she knew the truth.

'Who told you?' he asked in a whisper.

'Papa did, last night,' she answered.

The old lady, who had been lying half asleep, was roused by his appearance at the bedside, and made an effort to sit up. Kate understood her movement; and with Lakeworth's assistance made her comfortable with pillows in the position she seemed to desire. She remained silent for a few minutes, as though endeavouring to remember something she wanted to say, and at last spoke: 'Call your father, Kate.'

Mr Dottleson's strident voice was audible in the passage below, demanding the immediate production of his umbrella; he was just on the point of leaving for business, and Kate lost no time in running down to him. 'Papa, wait a minute. Granny has just asked for you.'

'I'll see her this evening; I'm late as it is.'

'But, father, please come now; it may be too late this evening.'

Mr Dottleson threw down his hat, and followed his daughter up-stairs, muttering something about 'morbid nervousness.' He was smarting sorely under the recollection of yesterday, and had not intended to pay more attention to his mother-in-law than common decency demanded of him. His manner softened when he entered the room and took his stand at the foot of the bed, for he saw in her face that she would not detain him long. He spoke as gently as he could; he tried to forget his wrongs for the time, knowing that he was in the presence of Death.

'What can I do for you?' he asked.

Mrs Lamshed did not answer at once; she took Charles Lakeworth's hand in hers and reached with the other for Kate's to place within it as they stood, one on either side of the bed; then laying her own upon them, she raised her eyes to

meet those of her son-in-law. 'Promise,' she said earnestly.

All Mr Dottleson's angry disappointment rushed upon him with uncontrollable power as he grasped her meaning, and the group waited for him to reply. He turned sharply and strode over to the window, whilst the three maintained their position, watching him in silence. He stared steadily out on the dreary square, hardly conscious that he saw anything, engulfed as he was in the storm of conflicting passions which the appeal had roused. What was he to say? He had been taken at a disadvantage, and would not thus be tricked into giving way; he would not make a promise he must regret for the rest of his life to soothe the last hours of one who had treated him so maliciously as Mrs Lamshed. But even in his voiceless rage there awoke within him a feeling of something like envy as he saw the mighty difference between his own narrow-minded sordid nature and that of the dying woman, whose last breath was spent in pleading for the happiness of those she loved. He recalled the time, twenty years ago, when, as a struggling, poverty-stricken clerk, he married Dorothy Lamshed, against the wishes and advice of her parents. Her mother had opposed the union firmly; but when it had taken place in spite of her, she never turned her back upon them in time of need. Then came the days of his success in the world, when Mrs Lamshed had acknowledged her shortsightedness, and made him her heir after Dorothy died. The leading points in his life, in which his wife's mother had borne a part, passed rapidly through his mind, and upon no single act of hers could he lay a reproachful finger, saying, 'This was unjust,' or even 'This was unkind.' Could such a woman have so changed towards him at the eleventh hour? Were his suspicions as to the doings of yesterday wrong, after all? He stole a look round: Charles and Kate still bent across the old lady with hands clasped beneath hers, whilst she looked at him in dumb appealing patience. He would grant this last prayer of hers, almost the only one she had ever made, but under conditions. Obstinate pride, if nothing else, forbade his giving free consent to the marriage after he had declared it to be impossible; he owed it to himself. He came back to his station at the foot of the bed and collected himself to speak, but even while he did so the end came. Mrs Lamshed's hand slid gently from those on which it rested, and the eyes which were watching him so eagerly grew fixed and dull. It was all over—she was dead.

The rain beat fiercely upon the window, and the autumn wind moaned through the leafless branches in the square outside. Within, the three stood mutely round the bed, unwilling to disturb the stillness which had last been broken by the voice they were never to hear again. Presently, Mr Dottleson drew himself up and softly left the room. The real character of the man asserted itself when he was once more alone. 'Just in time,' he murmured in a whisper which had a tinge of awe in it—'just in time.' Had Mrs Lamshed lived only five minutes longer, she would have heard his promise to let his daughter marry Charles Lakeworth as soon as he was satisfied that the income derived from his profession was sufficient to support a wife. Having before him

the dread of Dr Lakeworth inheriting Mrs Lamshed's money, he was determined that his own loss should not be the means of removing his objection. However, fate ordained that he should be unfettered by any such promise, and he assured himself that it would be long before consent was wrung from him, now that he could forbid Charles Lakeworth the house without consulting the feelings of any one else. Kate's did not count—she was barely twenty, and could not be expected to know her own mind yet. At all events, he knew what was best for her, and would exercise his own discretion in a matter so vitally important to her well-being.

'I won't disturb them now,' he reflected cynically; 'they know that the farewell they say to-day will be a long one; and Kate, no doubt, is a good deal upset by her grandmother's death.'

He saw neither his daughter nor her lover again that day, though the latter remained in the house until dark. Had opportunity offered, he would have told the young man what his decision was, and have ordered him to cease all intercourse with Kate from that day forth; but his mind was too full of speculations as to the provisions of Mrs Lamshed's last will, and he was disinclined to go out of his way to add a fresh element of trouble to that which already reigned in the house.

Time dragged slowly by until Monday, when the funeral took place, and Mr Reginald Slimp arrived for the purpose of acquainting Mr Dottleson with the contents of the document he had prepared on the preceding Wednesday, under Mrs Lamshed's instructions. It would be hard to say whether astonishment or delight was predominant in Mr Dottleson's mind when he read the will. His mother-in-law had left her property in trust to himself until the day his daughter Kate should marry with his consent, when it was to be made over to her; the income derived therefrom being set apart for his sole use and behoof until that event should take place. Should Kate marry during her father's lifetime without first obtaining his permission, her wedding day was to be signalled by the transfer of her grandmother's money to the Central Asia Missionary Society, to be devoted to such purposes as the administrators of that institution should see fit. Mr Slimp was the sole executor.

'I see,' said Mr Dottleson, gleefully rubbing his hands. 'The poor old soul thought that I would give way at the very end, and this clause about the missionaries was provided in case I retracted afterwards. Well, well; we needn't say anything more about it, now she's gone; but it will be a long time before a shilling finds its way into Central Asia or anywhere else. She must have been a little touched in the head when she put that in. She might have left me as executor too.'

Foreign Missions were Mr Dottleson's special antipathy, and Mrs Lamshed had borne this in mind when she dictated her will. When in the heat of the moment she ordered the solicitor to be sent for, she contemplated making a far more radical change in its terms than she afterwards thought would be either just or prudent. She had intended to strike out Mr Dottleson's name, and leave all she had unconditionally to Kate; but she reflected that her son-in-law's conduct hardly merited such treatment as this, and that,

moreover, such a step would place him in direct conflict with his only child, by enabling her to defy his authority. Firm in the conviction that her grand-daughter and Charles Lakeworth would remain true to one another, she trusted to Mr Dottleson's better nature to yield to their wishes in time. When he saw that the two were bent upon marriage, it was hardly likely that he would continue his opposition, particularly if the total loss of the estate to the family were made the penalty of discountenance. Her aim was to compel his sanction to a union she had set her heart upon bringing about, and, as we have seen, she was called away in the very act of trying to obtain it.

Mr Dottleson lost little time in placing his veto on Charles Lakeworth's visits after Mrs Lamshed's death. To give him his due, he went about the business with less bluster than might have been expected, for his mother-in-law's will had given him an agreeable surprise, and it made him generous. To use his own expression, he held all the trumps, and could afford to play his hand easily. He took Kate to book first, and with all the delicacy he could command—it was not much—pointed out that as her lover was not just such a man as he could conscientiously approve of, he must request her to give up all communication with him. The attack was a failure. Kate firmly but respectfully declined to throw over the man to whom she had given her promise. Mr Dottleson reminded her that she had no right to make any engagement without obtaining his sanction. Kate admitted that there was truth in this; but called his attention to the fact that he had given Charles Lakeworth permission to come to the house when he declared his attachment, and had never withdrawn it. If that did not justify her action in promising to marry him, she couldn't help it now; she had given her word, and intended to keep it.

Mr Dottleson, very majestically, would be glad to know what she proposed to do. Kate candidly admitted that she proposed to ally herself with Charley as soon as he was in a position to make her his wife, and hoped that her father would not withhold his consent. Mr Dottleson hastened to assure her that he would never permit his child to marry a man who had revealed such a character as Dr Lakeworth in his paltry attempt to impose upon poor Mrs Lamshed. Kate hotly repudiated the insinuation, and any one's right to make it.

Mr Dottleson's knowledge of the world compelled him to adhere to his opinion, and he capped this remark by hinting that when Dr Lakeworth was made acquainted with his objections and the terms of Mrs Lamshed's will, his affection for Kate would probably cool down. Miss Dottleson, who inherited a small share of her father's temper, retorted angrily, that if he thought that, there was no necessity for him to keep them apart.

Mr Dottleson smiled a smile of superior wisdom, and brought the discussion to a close by telling his daughter that he preferred to be on the safe side, and must therefore forbid Dr Lakeworth's visits at Blakewood Square.

To that, Kate had nothing to say; she could not dispute any orders her father pleased to give in his own house, however deeply they affected her. She shrugged her shoulders, and left the

library in silence, to write a long and passionate letter to Charles, telling him the substance of the conversation she had just had with her father, and begging him to name a place where they could meet.

'If I'm not to see him here, I'll see him somewhere else,' thought Kate as she laid down her pen. 'Papa isn't likely to throw away a thousand a year when he sees I'm determined to marry him.'

'She'll soon get over it,' mused papa as he climbed into the City omnibus that morning. 'She isn't likely to throw away a thousand a year in hard cash, when she understands that I have made up my mind.'

Kate was so thoroughly satisfied with the soundness of her reasoning, that she troubled herself much less about her father's prohibition than he anticipated, whilst he felt that it needed little vigilance to protect so strong a position as that which he now held. He therefore decided that he would carefully abstain from referring to the matter at all for the future. He knew that his orders regarding Dr Lakeworth's exclusion from the house would be obeyed, and though he had passing doubts as to whether that would put a stop to the young people's friendship, he thought it best not to draw the reins too tight all at once. Time would complete what he had begun, and harsh treatment might drive Kate into doing something foolish.

So he remained in happy ignorance of the fact that his daughter and Charles Lakeworth made a practice of meeting regularly at the lodgings occupied by a Miss Amelia Mumhole, who was proud to call the young doctor her nephew, and would do anything for him that he chose to ask. When Miss Dottleson's letter telling him that the servants had been directed not to let him in when he called, and asking if he had any relation or friend at whose house they could meet quietly, reached him, he put on his hat and went straight to his aunt Amelia in Barton Terrace. Miss Mumhole gladly welcomed the chance of taking part in anything which would give a little interest to the monotonous humdrum life she led, and her sitting-room was at once placed at her nephew's disposal whenever he might want it. The tryst thus thoughtfully provided was in very frequent requisition; and one afternoon about three weeks after Mr Dottleson had closed his door to Charles Lakeworth, it witnessed a meeting which requires some notice from us. The two were sitting over the fire, and the considerate Miss Mumhole reclined on the sofa as far away as possible, absorbed in the pages of the *Queen*.

'Has your father said nothing about me yet?' asked Charles. It was a question he put as often as he saw Kate Dottleson.

'Not a word. He has never mentioned your name since the day I told you of.'

'What do you think it means?'

'I suppose he imagines that I've forgotten you,' laughed Kate.

'We can't go on like this for ever, you know; my work is gradually increasing, and for your sake I must push on.'

'I don't intend to go on this way any longer, Charley. I'll make one more attempt to get papa's leave, and if that fails, I have thought of a plan to make him give it.'

'How will you manage that?'

'I'll tell you to-morrow. I can't say for certain that it will succeed, but we must try.'

They parted soon afterwards, and Kate went home to Blakewood Square. She had no hope of obtaining Mr Dottleson's sanction by begging, and her mind was full of the scheme by which it was to be wrested from him.

LEANING TOWERS.

AMONG the so-called wonders of the world the Leaning Tower of Pisa is usually included, and there can be no doubt that it is a great curiosity. But it is by no means unique; North Italy can exhibit an extraordinary number of towers staggering in all directions, and all leaning from precisely the same reason.

We have indeed in England few spires of any great altitude that are quite upright. Salisbury sensibly inclines. So, but in less degree, does that of Norwich. Chesterfield spire does not lean, but is twisted, corkscrew fashion, through the warping of the timber that supports the lead-covering. This is quite distinct from the case of the towers, all of which lean through uneven sinkage of the foundations.

The campaniles of Italy have a peculiar character: they run up to a great height, and, unlike Gothic spires and towers generally, have no buttresses. It is probable that the feeling for classic architecture always prevailed in Italy, and the medieval architects shrank from the introduction of the buttress because there was no warrant for it in antiquity. The ancients did not run up these lofty towers; they did not erect such buildings rising to a vast height as was required for Christian worship. The Italian architects of the Middle Ages had to build lofty churches and high campaniles, and were hampered by their adherence to precedent. They did not venture boldly and sensibly to buttress them, because the old Roman architects had not used the buttress. The consequence was they got into difficulties. In France, in Germany, in England, everywhere else, the church tower was attached to the church; the church even helped to put a shoulder to the tower and keep it up; but this was not done in Italy, for experience proved that the tower, being heavier than the church, cracked its walls and pulled it down; consequently, the bell towers are built detached. Who does not know Giotto's lovely campanile at Florence standing apart from the beautiful *duomo*? At Pisa it was the same. A cathedral was built, and a tower was built detached from it, both of white marble. And well it was that they kept their distance. The cathedral, standing on a broad basis, remains upright; but the campanile has sunk on one side and leans over.

Pisa is built on the rubble brought down by the Arno; the whole of the broad basin is filled to an unknown depth with rolled limestone pebbles, and sand brought down from the Apennines. The Arno almost dries up in summer, and is only a strong stream when the snows are melting or after storms; then it rolls down vast quantities of pebbles. Now, the very Gospel warns men against building on the sand; and if it be necessary to build thereon, then common-

sense enjoins the broadening of the base, so as to distribute the weight of the superincumbent mass over the widest possible area. This is the principle on which the Gothic architects acted everywhere save in Italy. There, hampered by their absurd prejudice, they attempted the impossible—to build lofty towers on the narrowest possible bases. The result was—a disappointment, an inevitable failure.

Precisely the same conditions exist at Venice and in the basin of the Po. At Venice is mud, and buildings have to be erected on piles driven into the mud bottom of the shallow Adriatic. The vast district between the Apennines and the Alps is a plain composed of nothing whatever but rolled stones brought down from the mountains by the Po and its tributaries, the stones intermingled with sand. The great cities of North Italy—Milan, Bologna, Mantua, Piacenza, &c.—are all planted on this mighty rubble-bed. A few spade-depths below the surface and water is reached.

Common-sense bade the architects here also adapt themselves to the conditions of the country and widen their bases. But with extraordinary perversity, they tried to do the impossible—erect towers of extravagant altitude on absurdly narrow foundations. Bologna is an instance in point, a more striking one even than Pisa, to which we will return presently. Now, Bologna bristles with towers. It became a matter of pride among the noble families in the Middle Ages to have these tall and useless towers; they were useless, mere monuments of human perversity, for they were not designed to hold bells. They were not adapted as strongholds. In a piazza there, stand two of these towers. The Torre degli Asinelli was begun in 1109; it is two hundred and ninety-three feet high and eighteen feet square. It inclines three feet four inches from the centre of gravity. Close to it is another, La Garisenda, built about the same time by the brothers Filippo and Oddo Garisendi; it is only one hundred and thirty feet high, but leans eight feet from the perpendicular to the south, and three feet to the east. Nothing can be more astounding than the first sight of these towers. They are square and windowless, and look like square rulers set up on end, and toppling over. Dante compares the giant Anteus, bending to lift him so as to bear him to the depths of the Inferno, to La Garisenda. Goethe says: 'The leaning tower has a frightful look, and yet it is most probable that it was built thus designedly. This seems to me an explanation of the absurdity. In the troublous times of the city, every large house was a fortress, and every powerful family had a tower. By-and-by the very possession of such a building became a mark of importance and distinction, and as at last a perpendicular tower became a perfectly common and every-day object, a leaning tower was built. Architect and owner attained their end: the mass of upright towers are just glanced at, and all hurry on to examine the leaning one.' This theory is ingenious. It is accepted by Baedeker in his Handbook, for he says: 'This is probably the only one of the many leaning towers in Italy whose obliquity has been intentional, but it was found impossible to complete it.'

It is, however, a mistake to think that the tower was so erected, as Artemus Ward would

say, 'out of pure cussedness.' The extraordinary height of the Asinelli Tower excited the envy of the rival family, and the Garisendi Tower was begun on the same dimensions at the base, eighteen feet, a few paces from it, with the object of overtopping it. However, the fates proved unpropitious; the precarious sand and rubble at the base shifted, and the tower lurched over. It was carried up as far as possible, till the centre of gravity would no longer fall within the base, and then it was reluctantly abandoned.

At a bowshot off, in the Via Arabella, is a third tower, the Torre Guermanni, which also leans, but not to the same extent; and the lofty campanile of the church of S. Giacomo has also a very sensible inclination. Again, in the grand piazza, now named after Victor Emmanuel, is the fine Palazzo del Podestà, designed to hold bells. This has a street or roadway running under it, so that it rests on arches—a still greater interference with the base; and, as a natural result, this also has a certain inclination, though not so great as that of the towers that stand alone, for it is tied on the south and north side into solid blocks of buildings, and thus the pressure downwards is distributed. Hard by is the noble Palazzo Pubblico, or municipal palace, begun in 1290, and this has a tower, but planted at the angle of the building, which serves thus to broaden its base and carry off the pressure; and although the palace is lofty and of brick tied into the tower, not a sign of settlement is visible in the brickwork or inclination in the tower.

At Lodi is another tower that is not upright; and about two and a half miles to the south stands a stately church, which has a campanile very lofty, which, if the writer's eye did not deceive him as he passed it in the train, is also out of the perpendicular. The campanile of La Ghirlandina at Modena is perhaps the finest in North Italy. It is three hundred and thirty-five feet in height, and was erected between 1224 and 1319. It stands near the *duomo*, with which it is connected by a cloistered walk. The tower derives its name from the sculpture which entwines it like a garland. Not only is this tower out of the perpendicular, but the cathedral also is on the incline.

Very few of the campaniles in Venice are perfectly upright.—Now, let us return to Pisa. Here, at all events, some concession was made by the architect to the nature of the ground on which he designed to build. He did not attempt to erect a square ruler and balance it on loose rubble; he designed a circular tower of much greater diameter, but still with the same fatal disregard to the principle of distributing the pressure over a wide surface. If a man desires to support a great weight on his head, he instinctively plants his feet apart. This should have taught the Italian architects, what to do when they built towers; however, it did not, and that is why Northern Italy is the land of towers staggering in all directions like tipsy men. The campanile of Pisa is only one hundred and seventy-nine feet high, but then it is thirteen feet out of the perpendicular. Of this tower, Dickens said: 'Sismondi compares the tower to the usual pictorial representations in children's books of the Tower of Babel. It is a happy simile, and conveys a better idea of the building than

chapters of laboured description. Nothing can exceed the grace and lightness of the structure; nothing can be more remarkable than its general appearance. In the course of the ascent to the top—which is by an easy staircase—the inclination is not very apparent; but at the summit it becomes so, and gives one the sensation of being in a ship that has heeled over through the action of an ebb-tide. The effect upon the low side, so to speak, looking over the gallery, and seeing the shaft recede to its base, is very startling; and I saw a nervous traveller hold on to the tower involuntarily, after glancing down, as if he had some idea of propping it up. The view within, from the ground—looking up as through a slanting tube—is also very curious. It certainly inclines as much as the most sanguine tourist could desire. The natural impulse of ninety-nine people out of a hundred who were about to recline upon the grass below it, to rest and contemplate the adjacent buildings, would probably be, not to take up their position under the leaning side, it is so very much askant.

This tower was begun in 1179, and had not been carried up one-third of the meditated height, when, owing to the subsidence of the foundations on one side, it began to incline. The masonry was then strengthened by iron clamps, which preserve the tower from falling.

To return once more to Bologna, where is the largest assortment of leaning towers. On the north side of the city is a domed mound, possibly an old tumulus, now converted into public walks. The view from the summit contains the whole range of reeling shafts—an odd spectacle—to me, not a little inclined to moralise, containing a parable. It seemed to me that this prospect of Bologna was not a little like the lookout on mankind: all men designed to be upright, straight in action, but all more or less deviating from ideal rectitude, some leaning more than others, only those who have not let their centre of gravity fall without their base—standing. The other, the more obvious moral—to make sure of your foundations before you build, especially in the great edifice of life—I leave to the reader.

THE BRAVOES OF MARKET-DRAYTON.

To the north of the Wrekin, amid the rolling pastoral country which forms the borders of the counties of Shropshire and Staffordshire, there lies as fair a stretch of rustic England as could be found in the length and breadth of the land. Away to the south-east lie the great Staffordshire potteries; and farther south still, a long dusky pall marks the region of coal and of iron. On the banks of the Tarn, however, there are sprinkled pretty country villages, and sleepy market towns which have altered little during the last hundred years, save that the mosses have grown longer, and the red bricks have faded into a more mellow tint. The traveller who in the days of our grandfathers was whirled through this beautiful region upon the box-seat of the Liverpool and Shrewsbury coach, was deeply impressed by the Arcadian simplicity of the peasants, and congratulated himself that innocence, long pushed out of the great

cities, could still find a refuge amid these peaceful scenes. Most likely he would have smiled incredulously had he been informed that neither in the dens of Whitechapel nor in the slums of Birmingham was morality so lax or human life so cheap as in the fair region which he was admiring.

How such a state of things came about it is difficult now to determine. It may be that the very quiet and beauty of the place caused those precautions and safeguards to be relaxed which may nip crime in the bud. Sir Robert Peel's new police had not yet been established. Even in London the inefficient 'Charley' still reigned supreme, and was only replaced by the more efficient Bow Street 'runner' after the crime had been committed. It may be imagined, therefore, that among the cider orchards and sheep-walks of Shropshire the arm of Justice, however powerful to revenge, could do little to protect. No doubt, small offences undetected had led to larger ones, and those to larger still, until, in the year 1828, a large portion of the peasant population were banded together to defeat the law and to screen each other from the consequence of their misdeeds. This secret society might have succeeded in its object, had it not been for the unparalleled and most unnatural villainy of one of its members, whose absolutely callous and selfish conduct throws into the shade even the cold-blooded cruelty of his companions.

In the year 1827 a fine-looking young peasant named Thomas Ellson, in the prime of his manhood, was arrested at Market-Drayton upon two charges—the one of stealing potatoes, and the other of sheep-lifting, which in those days was still a hanging matter. The case for the prosecution broke down at the last moment on account of the inexplicable absence of an important witness named James Harrison. The crier of the court having three times summoned the absentee without any response, the charge was dismissed, and Thomas Ellson discharged with a caution. A louder crier still would have been needed to arouse James Harrison, for he was lying at that moment foully murdered in a hastily scooped grave within a mile of the court-house.

It appears that the gang which infested the country had, amidst their countless vices, one questionable virtue in their grim fidelity to each other. No red Macgregor attempting to free a clansman from the grasp of the Sassenach could have shown a more staunch and unscrupulous allegiance. The feeling was increased by the fact that the members of the league were generally connected with one another either by birth or marriage. When it became evident that Ellson's deliverance could only be wrought by the silencing of James Harrison, there appears to have been no hesitation as to the course to be followed.

The prime movers in the business were Ann Harris, who was the mother of Ellson by a former husband; and John Cox, his father-in-law. The latter was a fierce and turbulent old man, with two grown-up sons as savage as himself; while Mrs Harris is described as being a ruddy-faced pleasant country woman, remarkable only for the brightness of her eyes. This pair of worthies

having put their heads together, decided that James Harrison should be poisoned and that arsenic should be the drug. They applied, therefore, at several chemists', but without success. It is a remarkable commentary upon the general morality of Market-Drayton at this period that on applying at the local shop and being asked why she wanted the arsenic, Mrs Harris ingenuously answered that it was simply 'to poison that scoundrel, James Harrison.' The drug was refused; but the speech appears to have been passed by as a very ordinary one, for no steps were taken to inform the authorities or to warn the threatened man.

Being unable to effect their purpose in this manner, the mother and the father-in-law determined to resort to violence. Being old and feeble themselves, they resolved to hire assassins for the job, which appears to have been neither a difficult nor an expensive matter in those regions. For five pounds, three stout young men were procured who were prepared to deal in human lives as readily as any Italian bravo who ever handled a stiletto. Two of these were the sons of old Cox, John and Robert. The third was a young fellow named Pugh, who lodged in the same house as the proposed victim. The spectacle of three smock-frocked English yokels selling themselves at thirty-three shillings and fourpence a head to murder a man against whom they had no personal grudge is one which is happily unique in the annals of crime.

The men earned their blood-money. On the next evening, Pugh proposed to the unsuspecting Harrison that they should slip out together and steal bacon, an invitation which appears to have had a fatal seduction to the Draytonian of the period. Harrison accompanied him upon the expedition, and presently, in a lonely corner, they came upon the two Coxes. One of them was digging in the ditch. Harrison expressed some curiosity as to what work he could have on hand at that time of night. He little dreamed that it was his own grave upon which he was looking. Presently, Pugh seized him by the throat, John Cox tripped up his heels, and together they strangled him. They bundled the body into the hole, covered it carefully up, and calmly returned to their beds. Next morning, as already recorded, the court crier cried in vain, and Thomas Ellson became a free man once more.

Upon his liberation, his associates naturally enough explained to him with some exultation the means which they had adopted to silence the witness for the prosecution. The young Coxes, Pugh, and his mother all told him the same story. The unfortunate Mrs Harris had already found occasion to regret the steps which she had taken, for Pugh, who appears to have been a most hardened young scoundrel, had already begun to extort money out of her on the strength of his knowledge. Robert Cox, too, had remarked to her with an oath: 'If thee doesn't give me more money, I will fetch him and rear him up against thy door.' The rustic villains seem to have seen their way to unlimited beer by working upon the feelings of the old country woman.

One would think that the lowest depths of human iniquity had been already plumbed in this matter; but it remained for Thomas Ellson, the rescued man, to cap all the iniquities of his com-

panions. About a year after his release, he was apprehended upon a charge of fowl-stealing, and in order to escape the trifling punishment allotted to that offence, he instantly told the whole story of the doing away with James Harrison. Had his confession come from horror at their crime, it might have been laudable; but the whole circumstances of the case showed that it was merely a cold-blooded bid for the remission of a small sentence at the cost of the lives of his own mother and his associates. Deep as their guilt was, it had at least been incurred in order to save this heartless villain from the fate which he had well deserved.

The trial which ensued excited the utmost interest in all parts of England. Ann Harris, John Cox, John Cox the younger, Robert Cox, and James Pugh were all arraigned for the murder of James Harrison. The wretched remnant of mortality had been dug up from the ditch, and could only be recognised by the clothes and by the colour of the hair. The whole case against the accused rested upon the very flimsiest evidence, save for Thomas Ellson's statement, which was delivered with a clearness and precision which no cross-examination could shake. He recounted the various conversations in which the different prisoners, including his mother, had admitted their guilt, as calmly and as imperturbably as though there were nothing at stake upon it. From the time when Pugh 'ticed un out o' feyther's house to steal some bacon,' to the final tragedy, when he 'gripped un by the throat,' every detail came out in its due order. He met his mother's gaze steadily as he swore that she had confided to him that she had contributed fifty shillings towards the removing of the witness. No more repulsive spectacle has ever been witnessed in an English court of justice than this cold-blooded villain calmly swearing away the life of the woman who bore him, whose crime had arisen from her extravagant affection for him, and all to save himself from a temporary inconvenience.

Mr Phillips, the counsel for the defence, did all that he could to shake Ellson's evidence; but though he aroused the loathing of the whole court by the skilful way in which he brought out the scoundrel's motives and character, he was unable to shake him as to his facts. A verdict of guilty was returned against the whole band, and sentence of death duly passed upon them.

On the 4th of July 1828 the awful punishment was actually carried out upon Pugh and the younger Cox, the two who had laid hands upon the deceased. Pugh declared that death was a relief to him, as Harrison was always, night and day, by his side. Cox, on the other hand, died sullenly, without any sign of repentance for the terrible crime for which his life was forfeited. Thomas Ellson was compelled to be present at the execution, as a warning to him to discontinue his evil practices.

Mrs Harris and the elder Cox were carried across the seas, and passed the short remainder of their lives in the dreary convict barracks which stood upon the site of what is now the beautiful town of Sydney. The air of the Shropshire downs was the sweeter for the dispersal of the precious band; and it is on record that this salutary example brought it home to the rustics that the

law was still a power in the land, and that, looking upon it as a mere commercial transaction, the trade of the bravo was not one which could flourish upon English soil.

AMERICAN BOOT-BLACKS.

'SHINE 'em up, sir? Only five cents a shine,' is quite a common salutation on the crooked, crowded streets of Boston, from urchins of all sizes, ages, and colours. It is not of these boys, however, we write, but rather of some of the oddities in Boston who pursue this useful calling.

The boy boot-blacks are under municipal regulation; pay, like the newsboys, a small license fee for their badge of office; and are by law compelled to attend some public school one-half of each day. The licensing is not for revenue, but in order to keep track of the boys in case of their neglecting to attend school. Also, like the newsboys, these 'wielders of the brush' have, through the benevolence of certain charitable ladies and gentlemen, 'homes' where they are made welcome and fed, warmed, and lodged at the very lowest possible cost, their moral welfare being at the same time looked after.

The coloured man has a strong partiality for this 'profession'; and we are fain to allow that blacking boots by a black man seems the most striking instance of the man 'fitting his occupation,' of anything we know of. That other favourite calling of the negro, whitening or white-washing of walls and ceilings, is so directly in contrast to the colour of the workman, that it cannot fail to impress one by its incongruity.

A stroll down town in the region of the post-office, the banks, and the mercantile community, will reveal, if looked for, many little corners and alley-ways occupied by sable boot-blacks. The outfit generally consists of a more or less comfortable chair, a canvas awning stretched over it, and the usual box, brushes, and blacking. The proprietor on fair days—for your boot-black is necessarily a fair-weather biped—solicits patronage from each passer-by, not boisterously, but in a quiet insinuating sort of way; and in addition, has a more or less elaborate sign standing near his workplace; and those signs are marvels in their way in colour, composition, and tone. Perhaps the commonest form reads something like this: 'Professor Jones, Boot-polisher. The boss shine 5 cents.' Or, 'Colonel Jenkins's nonpareil shine only 5 cents.' Five cents is the common rate for these outdoor 'artists.' Some add, 'Oil shine 10 cents'; and one we remember read, 'The shiniest shine in Boston, only 5 cents.' Another was, 'Patent-leather shine.' The most remarkable sign read something like this: 'The man who wears dirty boots is a blot upon the landscape, a hindrance to civilisation, and a disgrace to the commonwealth of Massachusetts.—Have your boots polished in a superior manner—up the alley—for only 5 cents.' Surely this man might have been considered sufficiently polished to have cared for the shoes of a Charles Sumner or a Wendell Phillips!

In all the respectable hotels, the porters of the house have regular stands in the basements where one may be polished with 'Day and Martin's' best at any hour for ten cents (or more). We are told

these porters, generally Irishmen, accumulate large sums of money in a few years, if they prove sober and industrious.

Over toward the old west end of the city, Sambo is frequently found occupying a small cellar or small store on the ground-floor. Here he sets up two or more chairs, boxes, &c., and hires assistants or takes in partners to aid him; often combining with the boot-blackening the sale of brushes, blacking, shoe-strings, cigars, tobacco, and even coal and kindling-wood. He sometimes also adds carpet-beating, whitening, clothes-cleaning, and such work to his list. But these are the aristocrats of the business. The fondness of the negro for big words shows itself here, for no sooner does he have a window large enough to paint a sign upon than he announces his six-by-nine den as a 'Boot-blackening Bazaar,' or a 'Boot-polishing Parlour' or 'Emporium.' This last word is very commonly used, and seems to the darkey proprietor just 'the thing' for the place and occasion. The ever-busy little Chinaman has not invaded this business as yet; but if he does, his industry and frugality are bound to make him a dangerous rival to the negro, who is inclined to be slow, and not too ambitious.

We know of but one German in the business, but he is *sui generis*, and perhaps as odd a little piece of humanity as one would meet anywhere. He occupies, free of rent, a corner of the lavatory in one of the handsomest railway passenger stations in Boston. He has served through the war as a soldier; is not over five feet three inches in height, wears very thick glass spectacles, and is blind of one eye. He is known all about that neighbourhood as 'Billy the boot-black.' He is by all odds the most thorough and best boot-black in the city; but of a very argumentative and querulous disposition. If a customer ventures upon the remark, 'It is a fine day,' Billy instantly fixes him with his sound optic and this reply, 'Well, it won't last long.' Or, if one ventures upon a remark on the current topic of the hour, Billy is always upon the opposite of the question, be it religion, politics, or even science. Billy as a companion would, I should say, be unpleasant, but Billy as a boot-black is unequalled. He has an easy-chair mounted upon two steps, with arrangements for moving it forward or backward as may be needed. He uses only the best English blacking and the finest of brushes, and is so particular, that he will turn up the foot of a customer and polish the inner curve of the shoe from heel to top. He has a mirror fixed beneath the chair, presumably to enable him to see the heel, and on the top of the mirror a small clock; but why the clock, and why *there* a clock, we know not, unless it be to remind Billy's philosophic mind that 'time is money' or 'time flies.'

His income cannot be much under ten dollars a day, as he charges ten cents a shine, and certainly can, if he chooses, polish one hundred pair of shoes a day. We have often been amused at this man's calm indifference to business. He knows, from the thousands and thousands of people passing through the station, he is sure of a living, as he has a monopoly of that business there, and he never asks a patron to 'wait,' or tells an impatient traveller he 'will soon be ready' for him. You may wait for him—and he never hurries—or go. If you wait, well; if

you go, well. Some one else will take your place. Billy should be a happy wight, but he is not, or his words greatly misrepresent him.

On Park Square in Boston is an Emancipation statue, presented to the city by one Moses Kimball, an old abolitionist. It represents Mr Lincoln standing erect reading the Emancipation proclamation, while at his feet is crouching a nearly nude figure of an African slave, from whose wrists are falling slavery's chains. Clothe this figure of the negro and put in his hand a shoe-brush in place of the broken handcuff, and it would be an admirable representation of a coloured boot-black at his trade; and one would think the boot-blacks were of that opinion, for they are plentiful in this neighbourhood, which is also a great thoroughfare. Pleasant Street—a sad misnomer now—leads from this square, and here a large coloured colony reside—waiters, boot-blacks, coal-merchants, and one very swell coloured tailor—all within a few yards of each other.

One Saturday night we were passing through Pleasant Street, and thought we would get our boots polished. We found a well-lighted 'emporium,' bearing this legend, 'Old Arm-chair,' on its windows; and on entering, we found three coloured workmen busily engaged, and were about stepping out; but a man got down from one of the 'old arm-chairs,' and we took his place. On our right was a white man being polished; on our left hand a pretty-dark nigger was having his 'plantation' boots fixed for Sunday; and at the door was a saddle-coloured gentleman, evidently a howling swell in 'culled circles,' who, having been through the boot-polishing process, was drawing on his tan dogskin gloves, buttoning his fawn-coloured covert-coat, and, with a heavy cane under his arm, about leaving. The black fellow on our left, a regular Cuffee, and withal a merry soul, was apparently creating some merriment, which ceased as we entered. The man of the cane—probably a waiter, or possibly valet, or even a head-waiter—remarked, as he gave himself a final look over: 'Well, now I've got my boots blacked, I guess I'll go an' get a b-a-w-th an' go home.'

To him the dark one said: 'Whar does ye go fur a baff, Mr Johnson?'

'Me!' says the swell. 'I goes mos' generally to Prof. Jones' Bathing Parlours on Fayette Street fur my bawths.'

'Wha' does de Perfesser charge fur a baff?' said our left-hand neighbour.

To which the swell said: 'Him! He charges ten cents fur a bawth wid one towel, an' twelve cents if you wants two towels; an' dat's cheap enuff.'

'I knows whar ye can get a baff fur nuffin', I does, an' whar dey hain't no extra charge fur towels neider, fur dey rub you down fur nuffin' arter de baff,' said Cuffee.

'Wharabout's dat place?' said the saddle-coloured one.

'In de Chawles ribber, Mr Johnson; an' a "cop" [policeman] will rub you down wid his club if he cotch you dar; an' don' you forgit it—haw, haw!' said the black fellow; and the swell left amid the laughter of the entire room, muttering something about 'low black trash' as he went out.

As a rule, all boot-blacks, white or black, Celt or African, are of a merry turn, and happy in their humble yet honest calling. They are unlike the uniformed 'London Shoe-black Brigade' or any other people in the same business of whom we have knowledge; but we daresay the student of small things would find interesting matter in boot-blacks anywhere; certainly those of Boston have given us much pleasure, at slight cost, in looking them up.

SORROW'S CROWN OF SORROW.

GREAT Poets are the world's great truth-tellers, and it is rarely indeed that a thoughtful reader dissents from the teaching, or fails to delight in the sympathy of the greater mind. Perhaps there is no arithmetic which can measure what we owe to the poets, who have enriched our language with the

Jewels five-words-long

That on the stretched forefinger of all Time
Sparkle for ever;

and have opened out mental vistas that are for ever expanding. Still the humblest may now and then demur, and differ from a renowned authority, or at anyrate feel that a subject has only been treated from one point of view, when the question has certainly another side to be considered.

Dante, one of the few poets who are in advance of all others, declares that there is no sorrow greater than to remember happy days when we are in misery. Surely, this is not true of all natures and of all sorrows! The misery we bring on ourselves by mistakes and misdeeds has its own peculiar pang of remorse, and there are few things more senseless than to deem a trouble unworthy of commiseration because a man 'has brought it on himself.' That is the very thing which claims our pity; assuredly it is not remembering the happier times which is the anguish, but rather recollecting the fault which ended them.

There are, however, many troubles which come to us either from the faults of others, or apparently directly from the Hand of God for our discipline and chastening; and in such instances there should be solace, not sorrow, in remembering the happier times. Let us suppose the case of suddenly reduced circumstances. Is there no thankfulness in remembering the day when we could help others, were it only in a trifling degree? Is there no satisfaction in knowing that our modest hospitalities were the means of bringing strangers together who were destined to form true friendships, one of the pleasantest privileges of entertaining guests? Is there no pleasure in looking back on the bright days of early travel, in remembering the wonders of nature and art one has beheld, and seeing them again in memory's untarnished mirror? The first view of the Alps, of Venice, of Naples, of Edinburgh—the first realisation of the majesty of art in the marvels of architecture, sculpture, and painting which have been bequeathed to us—surely such 'things of beauty' are indeed 'a joy for ever; for the joy once imbibed, it remains to solace us when age has dimmed the sight and made the eager footstep halt.

When stricken by illness, ought we to lament over the recollection of the happy days of health and vigour? Of one thing we may be sure—that all adversity has 'its uses,' and that there are very few natures, indeed, to which an unbroken course of prosperity would not be very detrimental. People who bear changes of fortune bravely are often highly praised, and to a certain extent justly; while perhaps too little compassion is shown to those who have never known freedom from cares and sorrows. We are all a little too apt to think, because they have never experienced any better condition they do not feel the pressure of their trials. With a very few undeveloped and uninspiring natures, it may be so to a certain extent; but with a vast multitude, so far from growing used to their troubles, they chafe under them more and more every day.

In a very popular novel, a village boy, fond of low amusements, improving his tastes, becomes a finer character, and on one occasion declares he has 'seen to the bottom of rat-catching.' It is a very good thing to have seen to the bottom of many pleasures that are higher in the scale than rat-catching. This is what people generally do in the days of ease and prosperity; whereas, the children of adversity often indulge in exaggerated imaginings of the pleasures and enjoyments beyond their reach, and really need to have had a little taste of prosperity to make them more patient under their trials. Experience of life shows that there is no human being altogether free from disappointments and troubles and temptations of some sort; in fact, circumstances frequently mould character, and perhaps the greater variety of circumstances an individual encounters, the more his character is developed. Therefore is it good for every one to have had a little taste of worldly delights, if only to 'see to the bottom of them,' and not confound pleasure with happiness. One special phase of this truth the present writer has observed over and over again. The girl who for two or three seasons has enjoyed the pleasures of society, more often settles down to a quiet domestic life, cheerfully and contentedly, than the girl married from the school-room or from a very dull home. And the man who has knocked about the world a little in his bachelor days commonly appreciates the happy home that should be an ark of rest to the breadwinner, much more than the stay-at-home youth, who, once emancipated, is eager to taste what is called pleasure—and so 'see to the bottom of it.' The earlier in life people gain their experience, the less dearly do they pay for it.

But we have wandered a little from our argument, that remembering happy days which are past in times of sorrow is not necessarily an aggravation of the trouble. When the happiness has been forfeited by wrong-doing, then it is the remorse which is the sting; but when time, the assuager of grief and repentance, the purifier of the heart, have done their work, surely even under these circumstances the memory of the lost happiness ought not to be a pain.

Old age is famous for its garrulity. Would the old like as well as they do to talk of their early days, their struggles and successes, if these recollections were mournful to them? Even struggles that have led to success become the 'pleasures of memory.' Really, so far from such retrospection

being painful, the happy events of life seem often to have acquired a soft glow that hides the asperities with which they were probably mingled.

Some old writer says: 'Blessings are like birds that hop about us with their wings folded, and we see not the brilliance of their plumage till they fly away.' Too often it is so; but that is no reason that we should not cherish their memory, and let it, like the long beams of sunset, shed around us a far-reaching glory.

COINCIDENCES.

In a recent number of this *Journal* appeared an article on Coincidences, under the heading of 'Good and Bad Luck,' regarding which a correspondent writes as follows:

'One afternoon, a few days ago, I was reading in *Chambers's* the above-named article, which tells how a gentleman bought a copy of Blair's *Sermons* from Mr Larkins, a bookseller; how, after paying for the book, he requested Mr Larkins to keep it for him for a short time, until he should call again to get it; and how, after the lapse of so long a time as six months, he turned up again just in time to find Mr Larkins, who had despaired of ever seeing the buyer again, in the act of selling the copy of Blair's *Sermons* again to another customer. —I had just read this story, when a knock came to the front-door. It was a lady with whom I am slightly acquainted, but whom I had very seldom had the pleasure of meeting or speaking to, who had called to say that as she and her family were leaving the place to reside elsewhere, and had some books that they did not want to take with them, she had brought me Blair's *Lectures*, in three volumes, in the hope that they might be useful to me. I need not say how gladly I accepted the gift; but I thought it quite as remarkable a coincidence as any I had read about in the article mentioned.

'I happened the same day to meet a friend, a clergyman, to whom I related the incident as a remarkable coincidence. I thought it still more remarkable when he said: "Yes, I knew Mrs L—— was going to give you Blair's *Lectures*," and had it not been for the fact that I had not a copy of Blair's *Sermons*, she would have made you the recipient of those too. As it was, I got them."

BROWN AND GOLD.

It is the time when harvest has begun;

The ferny bracken withered brown and slight,

Tinged with a brilliant wealth of glit'ring light—

A golden flood from the low, blushing sun—

Carpets the sloping hills, whose summits dun

Are kindly crowned with glowing radiance bright;

The brown lark singing in her aureate flight

Sinks earthwards when her closing trill is run.

Among the bracken sits my lady fair,

Sunburnt is her sweet face, and brown her hair,

Except where it has meshed the light of gold

Within its threads; so, too, her eyes are brown,

And on her hand, as dusky as her gown,

Gleams a gemmed circlet—pledge her love I hold.

'BEAUTIFUL DARTMOUTH.'

A SOFT southerly breeze is blowing up Chunnel, and the *Corisande* is slipping along, close-hauled, through the summer seas. The outline of the lovely South Devon coast is shimmering in the heat, and the musical murmur of the waves upon the pebble beaches of many a cove comes like the song of far-off Naiads. Away to the left, Start Point rises in the haze; its white lighthouse tower standing out against the sky, and its jagged sides sloping like a steep-pitched roof. On the right, Berry Head marks the whereabouts of Tor Bay, on whose northern shore Torquay—loveliest queen of watering-places—clusters between and upon her lofty limestone hills. Ahead is a gap in the wall of cliff towards which we are steering, where the river Dart rolls its current to the sea.

'How is the tide, Elliott?'

'About slack, sir.—Keep her a bit closer, sir, if you can.'

The burly skipper gets a pull on the mainsheet, and then walks forward to give an order to one of the hands; and we watch the land rapidly nearing as the foam from the cutter's bows is flung off and left behind. Ten minutes later the blue-jacket comes aft again with: 'Keep her away now, sir; we can run slap in.'

The boom swings steadily out, the sheets are eased handsomely, and the *Corisande* lifts herself with a steady roll. There are finer and grander pictures, no doubt, but few lovelier ones than that which greets the yachtsman as he stands in from seawards for the Dart. On the headland at the south side of the entrance are the remains of Dartmouth Castle, that 'strange and mightie and defensyve new tower,' which Edward IV. stipulated should be built; and within them the church of St Petrox, of Early English work. High above is a height known as 'Gallant's Bower,' about which are curious old-world entrenchments and earthen ramparts. On the north bank are the villas of Kingswear; and below

Brookhill—a noble mansion, whose dining-room contains a portion of the chimney-piece in whose nook the great Sir Walter Raleigh indulged in the first pipe of tobacco smoked in this country—are the ruins of 'Gomerock Castle;' and the groove still exists in the rock where the huge chain was swung across to Dartmouth Castle as part of the defences of the olden time.

Gliding steadily onwards, we pass Warfleet Creek and its singing stream, and then suddenly 'Beautiful Dartmouth'—as Her Majesty Queen Victoria termed it when the royal yacht was driven hither by stress of weather—lies before us in all its picturesqueness, with its noble harbour at its feet, so land-locked you can almost fancy it a lake. But no lake ever saw such a fleet of vessels as are lying here to-day. Crack yachts are legion—cutters, yawls, and schooners—roomy cruisers and lean racers, stout five-tonners and flying-fifties; from whose forest of masts flutter the burgees of every club of worthiness and note; grim collier steamers are alongside the Kingswear quays; puffing steam-launches dart hither and thither; a smart cruiser rides majestically in mid-stream fully conscious that the white ensign that streams above her is the symbol of the mistress of the sea, and that she is there the monarch of all she surveys. In sharp contrast to her low-lying hull with its stumpy funnel and raking masts are the lofty, old, three-decker line-of-battle ships the *Britannia* and *Hindoostan*, whose ports glisten in the sun, and within whose wooden walls are trained some three hundred naval cadets, the future officers of England's navy. Steep hills clothed with thick oak-woods form a fine background to the whole; and behind them the Dart winds away with many a curve and sinuous turn up to Totnes and its weir, to become thenceforward a brawling silvan streamlet haunted by fisherman and artist.

Of all old-fashioned places, Dartmouth is one of the quaintest; and as soon as the *Corisande* is at her moorings, we lower away the gig, and tumbling in, scull over to the landing-stairs to explore it. Few towns of the brave West-country

are more ancient, though its neighbour opposite boasts that

Kingswear was a market town
When Dartmouth was a fuzzy down.

In the days of the Norman kings it was a flourishing place, and William Rufus is said to have embarked here when he went to raise the siege of the castles of Le-Mans. It was evidently a port of note in Chaucer's time, for he tells how, amongst his Canterbury pilgrims,

A Shipman was ther, woned for by West;
For ought I wote, he was of Dertemouth.

In 1190 it was the rallying-point for crusaders who followed the 'Lion-heart' to Palestine; and suffered severely by the departure of that monarch overseas, for during his absence the French stormed and sacked the town. In 1338 the Dartmouth mariners had their revenge, for they captured five French vessels and put their crews to death; and then, nine years later, they fitted out 'thirty-one shippes' to take part in Edward III.'s expedition against Calais. In 1377 the Frenchmen paid off these scores by taking and burning the town; an insult wiped out when, in 1403, a fleet of Dartmouth vessels sailed across the Channel, captured forty-one sail in the Seine, and returned laden with rich booty. But the crowning triumph came in the following year, when Du Chastel made another descent upon the Dart, and was ignominiously beaten off by the Devon sea-dogs, and their no less gallant wives, who helped, by hurling flints and missiles, to complete the rout, in which 'three lords and twenty knights of note' were taken and sent up to London.

Thus ended the duel between Dartmouth and France, much to the glory and renown of the staunch little town. That it was well to the fore when Spain's Armada threatened England's liberties is only to be expected, and it right loyally supported good Queen Bess with men and ships and money. When Charles I. and the Commons fell out, it again saw hard fighting and the horrors of war, for it was taken and retaken several times by the rival forces. It had also the questionable honour of giving the title Baron Dartmouth to one of Charles II.'s sons, and, moreover, entertained that monarch for a week when he kept his court here in 1671.

There is a tradition that King John granted the privilege of 'Mairalte' to Dartmouth; but the first charter extant is that of Edward III., dated 1341, which gives the town the right of self-government under a mayor and corporation on condition that it provided the king with two ships of one hundred and twenty tons whenever he needed them. One of the ancient rights of the place was that of coinage, and some of its halfpence are still in existence, having on one side the words, 'A Dartmouth halfpenny,' and on the other the town's arms, the figure of Edward III. standing in a ship supported by two lions.

The Dartmouth of to-day is a curious blending of old and new—its shops and older quarter cluster down by the water-side, where the hills bend back in a shallow curve, and its villas and newer part stretch along the wooded heights on each hand. Narrow streets, tortuous alleys, and steep stairways add to the picturesqueness

of the whole, and remind one somewhat of the old town of Edinburgh.

The two most interesting bits are the 'Butter Walk' and the church of St Saviour's. The Butter Walk runs at right angles up from the quay-side, and though modern 'improvements' have swept away most of its grandeur, it has yet a few of the fine old houses, with their richly-carved pillars, timbered gables and overhanging stories, in which once dwelt its merchant princes; and the royal arms in the black oak mantel-piece of one of them recalls the days when the Merry Monarch held his court here and walked up and down the piazza with his spaniels and fair ladies. But though these weathered fronts tell of the wealth and magnificence of their once owners, the interior of St Saviour's Church speaks yet more eloquently of the piety and liberality of these old Dartmouth traders. Its noble rood-screen and gloriously sculptured stone pulpit, rich in colour and rare in workmanship, once seen will never be forgotten; and the carved seats, and the front of the west gallery emblazoned with the arms of many a noble Devonshire family, recall the worshippers of long ago, who are sleeping under the stones beneath, but whose spirit still lives in every deed of English enterprise and daring. To the memory of one of them—worthy of all reverence—stout John Hawley, a brass yet remains in the chancel floor, dated 1408, and represents him in armour, between his two wives. The lady on his right is holding his hand; whilst she on the left has hers folded in prayer. Was she a pious devotee?—or less loved than the other? or is it merely a variation of artistic treatment? The old knight was so famed for his vast and lucky ventures in even those days of bold enterprises, that there arose a local saying:

Blow the wind high, or blow it low,
It bloweth fair to Hawley's Hoe.

But though a merchant, he was no mere money-grubber; for when the Dartmouth men 'manned forth a few ships at their own peril and charge,' and captured a French fleet in its own waters, he was in command, and took his full share of the fighting. Nor was he a mere selfish trader; for when Richard II., out of admiration for his bold deed, asked him to choose the favour he should receive, he would have no personal honour, but some bounty for his native place. It was thus that Dartmouth obtained the royal 'leopards' as supporters in its arms.

The south doorway of the church has a beautiful and curious design in metal-work representing the spreading branches of a tree, whereon two leopards or lions are mounted, with the figures 1631. The date is said to be of later work than the design, which some hold to have been wrought in celebration of the granting of the royal 'supporters.'

But the evening is drawing on apace, and the gig is waiting to take us back to the *Corisande*, and dinner. There she lies, our floating home, in mid-stream, with every spar and rope mirrored in the still water, looking a veritable picture yacht for sunshine and smooth tides; and not the staunch cutter which, with canvas snugged down, has driven through tearing squalls and staggering seas. Lounging upon the graceful counter, under the calm evening skies, listening to the tide swirling

softly beneath, and watching the after-glow kiss the hill-tops around, we recall some of the famous men who are associated with the Dart: Newcomen, one of the fathers of the steam-engine; Flavel, the divine; John Davis, the bold navigator; Sir Humphrey Gilbert, fearless adventurer and pious commander; and not least, Sir Walter Raleigh, dauntless soldier, intrepid seaman, courtly scholar, and gallant gentleman.

And we realise, too, the changes which time has brought, for round the point which saw the pin-naces and 'carraks' and fighting ships of bygone days drop down with the tide to plunder the Frenchman and harry the Spaniard, there glides majestically one of the stately steamships of the Clan line on her way to the Cape with her peaceful company of colonists and emigrants. And yet even in the midst of this scene of peace and happiness, there drifts the shadow of death, for over yonder a dripping form has just been lifted into a boat, out of the ebbing stream:

O river of Dart, O river of Dart,
Every year thou claim'st a heart.

Suddenly, a gun wakes the echoes of the hills, and from our truck and from scores of other taut masts burgees come fluttering down, for the Royal Dart Yacht Club has given 'gunfire' to all the pleasure craft on its station; and the yachtsman's day is over, for nautical etiquette is punctilious in the extreme, and rigidly observed.

JOHN VALE'S GUARDIAN.

CHAPTER XXXVI.

'You do your business pretty smart, gaffer,' said Isaiah, meeting Snelling a day or two after the encounter between them last recorded. 'You don't let the grass grow under your feet, you don't.'

'No,' returned Snelling, with a self-satisfied drawl and smile. 'When I know what I want, I pretty generally take it. I told you, you and me would have a laugh.'

'Let's have it now,' said Isaiah, with immovable solidity of countenance. 'Deadly funny, ain't it?'

'I closed my bargain,' Snelling said, 'the very day you spoke to me.'

'Closed it?' Isaiah echoed. 'Yes, and opened it too. I've been there, gaffer. It's no use drawing the wool over my eyes. I reckon you've got your knife into Mr Jousserau.'

'If Mr Jousserau wants the place,' said Snelling coolly, 'he can have it by paying for it. I shall want to make a bit out of my bargain. If he don't want it, I can find a use for it. The country side's opening up, and I can let the new house directly it's finished. I've been to Tallymount and looked over it, and I can make eight or nine rooms habitable for fifty pounds. I can go and live there, if so be your friend ain't willing to pay my price.'

In effect, it proved—Isaiah being entrusted with the negotiations—that Jousserau was by no means willing to pay the increased price Snelling set upon the property. He had been attracted by the picturesque look of the ruined house and the wild luxuriance of the neglected garden, and

almost as much as by these, by the extreme cheapness of the place. He laughed a little to think that in striving to do him an ill turn, his overreaching rival had pinched his own fingers, and so dismissed the whole matter from his thoughts.

Snelling, finding the place thus left upon his hands, set to work to make its remaining chambers habitable; and when the glaziers and masons had done with it, he furnished half-a-dozen rooms, and taking young John from Isaiah's tutelage, established himself in his new home. The main road from Heydon Hey to Castle-Barfield ran by the rusty gates of iron scrollwork which afforded the only visible indication of the residence to the wayfarer. The house itself stood far retired at the limit of its own grounds. There were legends respecting it which might have deterred a nervous or imaginative man from making a home within the remnant of its shattered walls. The last Tenant who had lived there was currently reported to have led a life of unexampled wickedness, and had been killed in his own bed by lightning fifty years ago. The house had taken fire and had burned itself out. For half a century no effort had been made to rebuild or repair it; and the ghost of the wicked Squire, naturally and properly, was supposed to haunt the scene of his dreadful death and no less dreadful life.

The whole demesne was surrounded by a lofty wall of the local stone, a coarse and splintery granite, whose harsh outlines the years had softened with mosses, grasses, wild-flowers, and trailing plants, until its original barren ugliness was altogether lost and hidden under the luxuriant touch of nature. Overlooking this wall on the western side there stood the fire-scarred relics of a turret, with one chamber intact, and above that tons of picturesque masonry, which seemed to hang together by a miracle. At the bottom of the turret was an arch of solid brickwork, which had formed the main entrance to the rear of the Hall, and still as bravely propped up its burden as on the day when its coping-stone was laid. A flight of stone stairs ran with a broad sweeping curve to the one tenable room which this old arch supported. Its lower steps were tangled with blackberry vines; and wherever Nature's minutest finger could plant a seed in a crack, flourished some wild-flower or grass-knot, until the solid slabs were forced by the soft insidious pressure of sprouting seed and swelling root from their original lines.

This turret, with its supporting arch, stood full thirty yards away from that remnant of the Hall in which Snelling had set up his new abiding-place; and in the interval between the two, where the main part of the building had once reared its splendid bulk, dogrose, bramble, and thistle and poppy, foxglove, fern, and quaker-grasses, climbed or clung about the low walls of the ruin.

From the first, young John took a boyish fancy to the turret chamber, and there Will Gregg and he, as became two adventurous youthful spirits, enjoyed the long-drawn pleasures of many days' starvation upon rafts at sea, sustained protracted sieges from invisible foes, took the scalps of imaginary Indians by the bushel, and alternated the parts of Crusoe and Friday on a desert island

of their own fancy's making. When the mid-summer holidays came round in their season, the two boys almost lived there; and Snelling, in some hope the place might prove to be dangerous and come tumbling one of these fine days about their ears, left them in undisturbed enjoyment of it.

The man in these days seemed living on a whirlpool. His own thoughts bore him round and round one dreadful centre, and his mind fixed itself always on the gulf that opened there, with a crazy longing to be hurled into it. His own projects were foiled on every hand; and he had upon him a constant sense of injury, which exasperated him madly. Everywhere his ward was responsible for his ill fortune; and the boy seemed to prosper in direct inverse ratio with his own hungry evil wishes for him. Proctor brought the most favourable intelligence about the discovered wealth on John's estate. Unthinking friendly neighbours congratulated him upon the find, solidly and heartily, meaning him no evil. Suspicious neighbours congratulated him with an under-meaning in face and voice, and he was prone to read that under-meaning everywhere. Avarice, hate, revenge, swelled and seethed about the keel of that devil's craft he had embarked on, and though to his own eye he seemed no nearer to its centre, every circle brought him nearer to it. His soul plumbed its depths at last, and he had no fear of them. From the zenith to the horizon of the firmament under which his dark soul rode towards its dreadful aim, there shone no star, whether of pity or foreboding.

Every man is two men at the least, and sometimes in us the better creature stands aghast at the incredible promptings of the baser. In him the two had made insensible approaches, and as it were without his knowledge, and now at last they were of one accord.

It was by no act of his that John had chosen the lamp which might have put an end to his life by its explosion at a fitting time. It was by no act of his, again, that the boy had made his playroom of a chamber which a thoughtful man would have looked at twice before he ventured to enter it. These were things for which he had no responsibility; but might he help Providence ever so little, and by doing so make himself rich beyond old dreams, and put that hated object out of sight without incurring so much as a breath of censure or suspicion?

The house had been built two hundred years ago, in days when the work of men's hands was meant to last. The mortar seemed to have grown to be an actual part of the brickwork and masonry it held together; but the chamber John had chosen overhung its supporting arch a little, and seemed to be held in its place by a mere cohesion of parts and half in defiance of gravitation. The two boys ramped and rushed about there and never shed it; and Snelling, watching their gambols sometimes from a distance, cursed the old builder's too honest workmanship.

Could he help Providence a little? Ever so little? A mere line of bricks taken out from the interior of the arch, for example? Taken out one by one in the night-time, and replaced, until some night the whole thickness of the arch, one

brick deep, should be easily swept away, and the chamber, with its superincumbent tons, should only wait the pressure of a foot to hurl it down? Surely, Fate tempted him. He knew, in his own dull uninventive mind, that if he had set all his wits to plot a scheme, he could have discovered or invented nothing so simple, so safe, so sure. Fate, fortune, luck, whatever name he chose to give it, had put this power within his hands.

He went to bed with the thought clear in his mind. The whole house lay asleep while he tossed and tumbled with that hideous fancy for his sole companion. The house had been furnished hastily, and the blind of his bedroom window fell some six inches short of the sash, so that on moonlit nights a gap of light was there, breaking the gray dimness of the window's oblong. He lay and stared at it, and if in his uneasy plunges, as some blunt spur of conscience pricked him, he turned his back upon it for a moment, an instant fear took hold of him, and made him look once more in that direction. A pointed, glittering, ghostly something reared itself like a crooked forefinger over the edge of the window-sash; like the peak of a ghost's head-dress, with phosphoric fires upon it; like an inexorable forefinger that moved one way without remorse or pause; like the point of a sword wielded by some righteous spirit conscious of his purpose, and threatening from afar to shear his soul in twain. No duller man, no man less fanciful, no man less conscious of the hell and heaven he carried in his bosom, laid his head upon pillow within twenty miles that night, and yet each and all of these strange fancies crossed his mind. He knew the while that the glittering point was no more than the horns of the crescent moon traversing the little space of exposed sky before him.

He would have it for a forefinger that beckoned—he would have it so. It should mean that, and neither less nor more. It beckoned towards the ruins. He chose that it should be inexorable, and having chosen so, he needs must follow it. Such tricks can fancy play the dullest embodiment of hate and avarice when the thoughts rise to murder. He rose, and moved about his own chamber noiselessly, like a midnight thief. He dressed himself roughly, and carrying his boots in hand, stole down the stairs. There he listened, with the darkness vast about him, and a whole blank black universe leaping at every heart-beat with murder at his ears. His own purpose appalled him; but that was nothing. Some insistent inward voice seemed to whisper that the thing was as good as done already. Some foolish perverted proverb of his youth was in his mind—'As well do it as think it'—a scrap of wisdom wrenched to folly's uses.

He found matches, a lantern, and a stump of candle. The harsh lock and harsher bolt shrieked warning as he opened the door with a laborious caution. He pulled his boots on outside, and trod with a thievish step upon the grass, not daring to let the loose and scattered gravel of the pathway prate of his whereabouts. Half-way he paused and turned, remembering that his bare hands were useless against the solid masonry. There was a lean-to shed which held garden-tools built out from the house, and here

he found the broken prong of a pitchfork, as likely a thing to suit his purpose as he could have expected. The door of the tool-house hung upon a single hinge, and grated on the ground as he reclosed it. He trembled at the noise, and stood sweating and shaking for a full minute, when he bethought him to have every right to be abroad, and that the excuse of any fancied noise about the grounds would easily explain his presence there. Even now he was resolute and collected enough to know, however, that the work of more than one night lay before him, and that his being observed once only might cast suspicion on him. No surcease of caution then. Step lightly. Listen with throbbing ears that detect a tracking footstep in the echo of your own. Find your own harsh breathing suddenly cast afar and changed to the breathing of an unseen watcher. Dread every rustle of the slumbering night.

He was underneath the arch, and safer, half sheltered from the bright night. The thing was not yet done, and for one moment he hung upon the edge of his abyss. It was altogether vain and foolish to question now whether he should plunge over or go back again, and yet he did it. A man in the maelstrom might as well have questioned—Shall I sink? Shall I swim? The steep looked dizzy, and whilst he hung above it, he was down.

He chose his place, and began to work. The first brick came out more easily than he had fancied possible. The mortar had crumbled somewhat with two hundred years of changeful weather. The next bit hard. His forehead was damp, and his unaccustomed plump hands were hot with labour before he had detached it from its place. The third, the fourth, the fifth, the sixth, succeeded. Then the whole vast chapter of life's accidents seemed opened. He saw himself ruined for a thousand reasons, sought for, called.

Enough for one night. He set the bricks back in their places, painfully picked up the larger fragments of mortar, dropped them in a corner crevice of the ground, and noticed with a disproportioned terror that the turf upon which he had stood looked trampled. He bent and brushed it with his fingers, and then stole back again. His fears stung him at every pore, but he reached his room in safety; and crawling noiselessly into bed again, fell to horrible dreams, in which the ruins tumbled upon him as he worked, crushing him with terror and with torture, and yet without effect on life or limb. Over and over and over again he broke the arch, and over and over and over again the ruins tumbled and overwhelmed him. Vaguely, in his dreams, he thought the way to peace and riches hard.

If the mingling of the forces of human nature were less grotesque and extravagant than it really is, the intrusion of the sordid comedy of Tobias Orme into the sordid tragedy of Robert Snelling might seem altogether wild. But Tobias served his purpose here, and might, for all one can tell to the contrary, have been born for no other end. The sovereign which Isaiah had bestowed upon that disreputable old person had not long staved off the attacks of thirst and hunger. He had fallen desperately ill by the wayside, had been found helpless and almost insensible with cold and pri-

vation, and carried to the workhouse infirmary. There the vital spark bade fair to quit its tenement; but after two or three months of flickering, now up, now down, grew feebly steady once more. The workhouse authorities, of course, were in favour of shipping him off to his own parish, and but for the doctor's energetic protest that he could not possibly survive the journey, would, at a dozen of their weekly meetings, have voted for his transport.

The knowledge of his narrow escape from death frightened Tobias terribly and set him thinking. Rum-and-water had brought him to that dreadful pass, and the frightened wretch made tearful profession of his fault to the chaplain, and signed a pledge of total abstinence with eager trembling fingers.

The chaplain became interested in him; and discovering him to be a person of some education, and now that he was no longer bemused in drink, of some intelligence, would sometimes sit and listen to Mr Orme's reminiscences, which were not always perhaps so truthful as they might have been. Tobias had read a good deal of imaginative fiction in his day, and it was as easy to say that his father had been a dissenting clergyman as it would have been to describe him as a small greengrocer and retail coal-vendor in Whitechapel. Perhaps it came as easy to Tobias to lie as to tell the truth. Perhaps no faculty can be cultivated to excess without danger to its opposite. A vocalist can elect to cultivate his voice upwards or downwards; but when once he has fixed his register, he will find it hard to change it.

It was not in the least likely that the slowly convalescing invalid should omit from the confidences with which he furnished the chaplain the one fact in his career which made him important in his own eyes.

'Humble? I am, sir,' said Tobias oftentimes in speaking of the newly opened coal-fields, 'I am the Columbus of that America. I think I may fairly say, sir, that my present condition is a monument of human ingratitude. Thousands upon thousands of pounds are being drawn every week from the bowels of the earth, and not one penny would ever have been touched if it had not been—I say it respectfully, sir, but whether I say it myself or whether I leave it for other people to say makes no difference, sir, to its veracity—not an atom of the money which has made poor men rich and rich men richer, would ever have gone into a human pocket if it had not been for my perspicacity and intelligence.'

This rather appealed to the chaplain; and the good man made inquiries of Isaiah Winter, who confirmed the story willingly enough, but shocked his questioner by an open avowal of his opinion with regard to Mr Orme's character at large. The chaplain urged that it was hardly fitting that the man should starve whilst other people profited so enormously by his discovery.

'I'll talk it over with my partner,' said Isaiah, 'and we'll see what we can do.'

As a result of the chaplain's intercession, Tobias came out of the workhouse infirmary to the receipt of a weekly income of eighteen shillings, provided in equal portions by Messieurs Day and Winter. The spring was well advanced at the time of his discharge, and though he was still

very feeble, and went quivering about on a pair of walking-sticks, the genial weather and movement in the open air soon set him up again. Wonderful to relate, he stuck to his promise of reform. The dread of death in a ditch became a monomania with him, and he grew miserly in his ways, depriving himself of all manner of creature-comforts, that he might save up something for the remnant of his days.

(To be continued.)

EARLY TELEGRAPHS.

HAPPENING the other day to make some casual remark with regard to the state of telegraphy in the latter part of the last century, the writer was promptly brought to book for his presumed ignorance of the fact, that at that time the effects produced by electrical machines when propagated in insulated conducting wires were unknown. It was not, however, to the electric telegraph that reference had been made; and as it subsequently transpired that the corrector was really ignorant of the fact that telegraphy flourished centuries ago, and that he was not even acquainted with the etymology of the word, the laugh was in the end turned against him. Though it is not likely that many educated persons are equally ignorant of this fact, yet a description of some of the rude shifts and expedients of bygone days for communicating at a distance may carry with them a certain amount of interest. Such aids as carrier-pigeons, speaking-tubes, and the like are outside the category of signal-making machines, adapted to express at a distance letters or words which at close quarters might be either spoken or written; as are also the various means employed to communicate a certain piece of intelligence, such as the result of any particular event, by signals previously agreed upon, as by lanterns, flags, fires, smoke, rockets, guns, drums, or trumpets.

The ancient Greeks and Romans practised telegraphy with the help of pots filled with straw and twigs saturated in oil, which, being placed in rows, expressed certain letters according to the order in which they were lighted; but the only one of their contrivances that merits a detailed description was that invented by a Grecian general named Aeneas, who flourished in the time of Aristotle, intended for communication between the generals of an army. It consisted of two exactly similar earthen vessels, filled with water, each provided with a cock that would discharge an equal quantity of water in a given time, so that the whole or any part of the contents would escape in precisely the same period from both vessels. On the surface of each floated a piece of cork supporting an upright, marked off into divisions, each division having a certain sentence inscribed upon it. One of the vessels was placed at each station; and when either party desired to communicate, he lighted a torch, which he held aloft until the other did the same, as a sign that he was all attention. On the sender of the

message lowering or extinguishing his torch, each party immediately opened the cock of his vessel, and so left it until the sender relighted his torch, when it was at once closed. The receiver then read the sentence on the division of the upright that was level with the mouth of the vessel, and which, if everything had been executed with exactness, corresponded with that of the sender, and so conveyed the desired intimation.

We must here pause a moment to point out one great advantage that this contrivance, simple as it undoubtedly was, will be seen to possess over the more scientific ones that follow, and that was, its equal efficacy in any sort of country and in any position, whether on a plain, on the summit of a hill, or in a sequestered valley.

To descend to more modern times. Kessler in his *Concealed Arts* advised the cutting out of characters in the bottom of casks, which would appear luminous when a light was placed inside. In the *Spectator* of December 6, 1711, there is an extract from Strada, an Italian historian, who published his *Prolesiones Academicæ* in 1617. In the passage referred to, the modern system of telegraphy is curiously indicated. It is as follows: 'Strada, in one of his *Prolesiones*, gives an account of a chimerical correspondence between two friends by the help of a certain loadstone, which had such virtue in it, that if it touched two several needles, when one of the needles so touched began to move, the other, though at never so great a distance, moved at the same time and in the same manner. He tells us that the two friends, being each of them possessed of one of these needles, made a kind of a dial-plate, inscribing it with the four-and-twenty letters, in the same manner as the hours of the day are marked upon the ordinary dial-plate. They then fixed one of the needles on each of these plates in such a manner that it could move round without impediment so as to touch any of the four-and-twenty letters. Upon their separating from one another into distant countries, they agreed to withdraw themselves punctually into their closets at a certain hour of the day, and to converse with one another by means of this their invention. Accordingly, when they were some hundred miles asunder, each of them shut himself up in his closet at the time appointed, and immediately cast his eye upon his dial-plate. If he had a mind to write anything to his friend, he directed his needle to every letter that formed the words which he had occasion for, making a little pause at the end of every word or sentence, to avoid confusion. The friend, in the meanwhile, saw his own sympathetick needle moving of itself to every letter which that of his correspondent pointed at. By this means they talked together across a whole continent, and conveyed their thoughts to one another in an instant over cities or mountains, seas or deserts.'

It was not till near the close of the seventeenth century that a really practical system of visual signalling from hill to hill was introduced

by Dr Hooke, whose attention had been turned to the subject at the siege of Vienna by the Turks. He erected on the top of several hills having a sky-line background three high poles or masts, connected at their upper ends by a cross-piece. The space between two of these poles was filled in with timbers to form a screen, behind which the various letters were hung in order on lines, and, by means of pulleys, run out into the clear space between the other two, when they stood out clear against the sky-line. The letters were thus run out and back again in the required order of spelling, and were divided into day and night letters—the former being made of deals, the latter with the addition of links or lights; besides which there were certain conventional characters to represent such sentences as, 'I am ready to communicate,' 'I am ready to receive.' In his description of the device, read before the Royal Society on the 21st of May 1684, Dr Hooke, after claiming for it the power of transmitting messages to a station thirty or forty miles distant, said: 'For the performance of this we must be beholden to a late invention, which we do not find any of the ancients knew; that is, the eye must be assisted with telescopes, that whatever characters are exposed at one station may be made plain and distinguishable at the other.' A cipher code was subsequently added by an ingenious Frenchman named Amontons.

In 1767 we find Mr Richard L. Edgeworth, the father of Maria Edgeworth, employing the sails of a common windmill for communicating intelligence, by an arranged system of signals according to the different positions of the arms. The signals were made to denote numbers, the corresponding parties being each provided with a dictionary in which the words were numbered—the system in vogue for our army-signalling till 1871, when the Morse alphabet was substituted for it.

And here we would make another short digression to state one undoubted advantage that the numeral has over the letter system; by way of illustrating which, let us suppose the case of an allied army. With the aid of a vocabulary in which words of the same meaning in the different languages of the nations comprising the force had the same number attached to them, intercourse could be carried on from one language into another which, though perhaps not strictly grammatical, would be sufficiently intelligible.

A great stride was made in 1793 by M. Chappe, a citizen of Paris, when the French Revolution directed all the energies of that nation to the improvement of the art of war; reporting on whose machine to the French Convention in August of the following year, Barère remarked: 'By this invention, remoteness and distance almost disappear, and all the communications of correspondence are effected with the rapidity of the twinkling of an eye.' It consisted of a strong wooden mast some twenty-five feet high, with a cross-beam twelve feet by nine inches jointed on to its top, so as to be movable about its centre like a scale-beam, and could thus be placed horizontally, vertically, or anyhow inclined by means of cords. To each end of this cross-beam was affixed a short vertical indicator about four feet long, which likewise turned on pivots by means of cords, and to the end of each was attached a counterweight, almost invisible at a

distance, to balance the weight of it. This machine could be made to assume certain positions which represented or were symbolical of letters of the alphabet. In working, nothing depended on the operator's manual skill, as the movements were regulated mechanically. The time taken up for each movement was twenty seconds, of which the actual motion occupied four; during the other sixteen, the telegraph was kept stationary, to allow of its being distinctly observed and the letter written down by those at the next station. All the parts were painted dark brown, that they might stand out well against the sky; and three persons were required at each station, one to manipulate the machine, another to read the messages through a telescope, and the third to transfer them to paper, or repeat them to No. 1 to send on. The first machine of this kind was erected on the roof of the Paris Louvre, to communicate with the army which was then stationed near Lille, between which places intermediate ones from nine to twelve miles apart were erected, the second being at Montmartre. The different limbs were furnished with argand lamps for night-work.

Shortly after this, our own government set up lines of communication from the Admiralty to Deal, Portsmouth, and other points on the coast, which we find thus reported in the *Annual Register* for 1796:

March 28th. 'A telegraph was this day erected over the Admiralty, which is to be the point of communication with all the different sea-ports in the kingdom. The nearest telegraph to London has hitherto been in St George's Fields; and to such perfection has this ingenious and useful contrivance been already brought, that one day last week information was conveyed from Dover to London in the space of only seven minutes. The plan proposed to be adopted in respect to telegraphs is only carried into effect between London and Dover; but it is intended to extend all over the kingdom. The importance of this speedy communication must be evident to every one; and it has this advantage, that the information conveyed is known only to the person who sends and to him who receives it. The intermediate posts have only to answer and convey the signals.'

The machines used consisted of three masts connected by a top-piece. The spaces between the masts were divided into three horizontally, and in each partition a large wooden octagon was fixed, poised upon a horizontal axis across its centre, so that it could be made to present either its surface or its edge to the observer. The octagons were turned by means of cranks upon the ends of the axles, from which cords descended into a cabin below. By the changes in the position of these six octagonal boards, thirty-six changes were easily exhibited, and the signal to represent any letter or number made: thus, one board being turned into a horizontal position so as to expose its edge, while the other five remained shut or in a vertical position, might stand for A, two of them only in a horizontal position for B, three for C, and so on. It was, however, found that the octagons were less evident to the eye at a distance than the indicators of Chappe's machine, requiring the stations to be closer together; nor could this telegraph be made to change its direction, so that it could only be

seen from one particular point, which necessitated having a separate machine at the Admiralty for each line, as well as an additional one at every branch-point. It was, moreover, too bulky and of a form unsuitable for illumination at night.

Here we may notice that in 1801 Mr John Boaz of Glasgow obtained a patent for a telegraph which effected the signal by means of twenty-five lamps arranged in five rows of five each, so as to form a square. Each lamp was provided with a blind, with which its light could be obscured, so that they could be made to exhibit letters and figures by leaving such lamps only visible as were necessary to form the character.

The next improvement again came from France, in 1806, when an entirely new set of telegraphs on the following principle was established along the whole extent of the coast of the French empire. A single upright pole was provided with three arms, each movable about an axis at one end—one near the head, the other two at points lower down, all painted black, with their counterpoises white, so as to be invisible a short way off. Each arm could assume six different positions—one straight out on either side of the pole, two at an angle of forty-five degrees above this line, and two at forty-five degrees below it. The arm near the head could be made to exhibit seven positions, the seventh being the vertical; but as this might have been mistaken for part of the pole, it was not employed. The number of combinations or different signals that could be rendered by this machine, employing only three objects, was consequently three hundred and forty-two against sixty-three by that of our Admiralty just described, and which employed six objects.

It was not long, however, before we copied the advancement of our neighbours across the Channel, and in some respects improved upon it, the main differences being that only two arms were employed—one at the top, the other half-way down, and that the mast was made to revolve on a vertical axis, so that the arms could be rendered visible from any desired quarter. Its mechanism, the invention of Sir Home Popham, enabled the arms to be moved by means of endless screws worked by iron spindles from below, a vast improvement on the old cords, the more so as they worked inside the mast, which was hollow, hexagonal in section, and framed of six boards bound together by iron hoops, and were thus protected from the weather. Inside the cabin he erected two dials, one for each arm, each having an index finger that worked simultaneously with its corresponding arm above, on the same principle as the little semaphore models to be seen nowadays in our railway signal cabins.

We have now described the most prominent of the numerous contrivances which, prior to the application of electricity to that end, were devised and made use of for telegraphic communication, all of which, unlike that subtle power that is not afraid of the dark and can travel in all weathers, possessed a common weakness in their liability to failure through atmospheric causes, fog, mist, haze, &c. To us who live in this age of electrical marvels, when that particular science more than all others progresses by leaps and bounds, it appears passing strange and almost incredible that so many years were allowed to elapse before the parents of the electric telegraph, the electrical

machine and magnetic compass, were joined in wedlock to produce their amazing progeny, which now enables all mankind however distant to hold rapid, soft, and easy converse.

MRS LAMSHED'S WILL.

CHAPTER V.—CONCLUSION.

THE interview which Kate had with her father that evening was not a very long one, nor was it remarkable for any display of feeling on either side. He had, as he said, made up his mind, and nothing Kate could say had the least effect upon him. She did her best; but when he rose from his chair and told her to leave him, she was no nearer gaining her end than when she broached the subject.

'Will you think about it again when he has got a good practice, father?'

'You have had my answer, Kate. It is finally and absolutely No. I will not think about it now or at any other time, and the sooner you forget the man the better.'

Clearly, there was no hope of doing things in an orthodox fashion; and before Kate went to sleep that night, she had thought out her project in detail, to lay before Charles Lakeworth next day.

'I sincerely hope I have settled that for good and all,' said Mr Dottlestone to the mirror after Kate had gone. 'If there's any more bother about it, I'll send her away into the country for a few months, and see what that will do.'

He was not destined to hear anything more from Kate; they met at breakfast as usual, and the hated name was not mentioned. His daughter's manner towards him was unchanged, and he told himself that she had accepted the inevitable at last, and would not trouble him again.

Miss Mumbole might have learnt the particulars of Kate's device and told them to us, had she been less interested in a speech which a great politician had delivered at a garden-party the day before; but the lovers conversed in such low tones that only a most attentive listener could have heard what they said. Their last few words were audible, and we are able to place them on record.

'Now just tell me exactly what you want me to do?' said Charles when Kate had unfolded her plan.

'All you have to do is to go to your lodgings and pack up at once; take away everything, and say you are not coming back. Don't forget to drop a hint to your landlady that you are going abroad.'

'Where am I to go, and what's to become of my patients?'

'Go anywhere you like, but don't show yourself on any account. You'd better ask some other doctor to look after your patients; it will give colour to the idea that you have left England.'

'If I took lodgings out at Highgate, it would do?'

'Yes; it would do very well. Send your address to Miss Mumbole, so that I can write to you.'

Charles reflected for a few minutes before he spoke again; the plan proposed seemed quite feasible, and promised success. He had everything to win, and little to lose; for if it prospered, Kate would be his with her father's sanction; and if it failed, he would be much where he was before. 'All right, Kate, I'll do it. Don't forget to write.'

'Very well; it's settled. You'd better go at once, and be sure you don't leave your lodgings later than four this afternoon.'

By three o'clock Dr Lakeworth was driving away from his old quarters with all his baggage, having asked a friend to take his practice for a day or two, paid off his landlady, and carefully imbued that worthy woman with the notion that he was bound for the Continent.

When Mr Dottleson came home that evening, and casually asked for his daughter, he was informed that she had gone away in a cab, taking a quantity of luggage with her, about an hour before. She had not told any of the servants where she was going, and the only clue to her destination was the order she had been heard to give the cabman, 'To Victoria.'

'Did she leave no message for me?' asked the astounded parent.

'No, sir.'

'Did she say when she was coming back?'

'No, sir.'

Every domestic in the house was examined in turn; but not a scrap of information could be gleaned which would throw a ray of light upon this extraordinary proceeding of Kate's. There was only one thing to be done, and Mr Dottleson did it. He sent for a hansom, and drove as fast as he could go to Victoria Station. There he made inquiries of the booking-office clerks; and his heart bounded with excitement when one of the men looked round from his desk and said that he recollected serving a young lady answering the description, with tickets for Dover.

'With tickets!' ejaculated Mr Dottleson. 'How many did she take?'

'Two first-class singles,' replied the man promptly.

That looked ugly; the faint suspicions he had dismissed as ridiculous, returned and took a very definite shape.

'When does the next train leave for Dover?'

'Express at 7.30, sir.'

Mr Dottleson looked at his watch: it was nearly six now, so he had an hour and a half to wait. He would employ the time profitably by going to Dr Lakeworth's lodgings and making inquiries there.

'Is Dr Lakeworth in?' he asked the woman who opened the door.

'No, sir; but Dr Lakeworth he sez as Dr Wilmot'—

'I don't want Dr Wilmot. When is Dr Lakeworth expected home?'

'He *ain't* expected; but Dr Wilmot'—

Time was too precious to be frittered away like this: he pushed past the woman into the passage and told her to call the landlady. The landlady took some time to answer the summons, and when she did, she proved to be but one degree more intelligent than the servant. Mr Dottleson speedily discovered this, and took her in hand with a firm patience which would have done credit to a Queen's Counsel.

Was Dr Lakeworth at home? No, but—Never mind that. When did he go away? Go away? It might have been three o'clock, or half-past, or even four; the clocks was—Never mind about the clocks. Was Dr Lakeworth coming back? He said as how he wasn't; but them medical gentlemen—Never mind medical gentlemen just now. Did he say where he was going? The landlady's countenance lit up with intelligence, and she fairly beamed with superior knowledge. She knewed *exactly* where Dr Lakeworth had gone. Mr Dottleson almost jumped off the table upon which he was seated, but choked down his eagerness, and repeated the question. The doctor was gone to furrin parts; to the Continent, he said. There was a certain amount of latitude in the address, but it was quite enough to harden suspicion into certainty. It was as clear as daylight. The two were off to the Continent via Dover. Kate and her lover had left their respective homes at the same time; the former had taken their tickets, and the latter had disclosed the direction they intended to take.

Mr Dottleson did not stand on ceremony; he was out of the house and back in his hansom before the landlady could turn round. Kate had eloped with Charles Lakeworth! A thousand pounds sterling per annum was trembling in the balance! O the wickedness, the deceit of the human heart! O the shortsighted, unfathomable folly of old ladies who made wills like that!

'Double fare if I catch the 7.30 from Victoria!'

They *must* be stopped. He would search every hotel in Dover. He would put on detectives to watch the Calais boat. A thousand pounds a year! Central Asia—Good heavens! was there ever such a snail in harness before? Were the London streets ever so crowded as they were now? This was all the outcome of that call for Smuggles's partner; the words were ringing in his ears when he got out at the station and paid off his cab. He was in time for the train, and lay back in his seat panting and breathless; he was tired, but as unswerving as ever in his purpose.

Dover at last. He walked out of the station and hailed a cab; he had had no dinner, but hunger was forgotten.

'Take me to all the hotels in the town one after the other,' he said to the dumfounded jehu.

'It will take the whole night, sir.'

'I'll make it worth your while.'

Whatever remuneration that cab-driver received he fairly earned it. He took his fare from one hotel to another, until his horse broke down, and he passed Mr Dottleson on to a belated 'growler' who was crawling home. At four o'clock in the

morning he drove up to the Station Hotel and dragged himself to bed; he had examined the visitors' book in every hotel in the place, and had questioned the hall porters besides; but not a trace had he found of the fugitives.

He slept until nine o'clock from sheer fatigue; but as soon as he awoke, he rose, swallowed his breakfast, and went to the police office, where he succeeded in obtaining the services of men to watch the boats, who were to telegraph to him if the pair were seen. Then he took the train back to town, and went direct to Starbone and Smuggles's office to see Mr Slimp, whom he found in his room looking as gaunt and sorrowful as ever.

'You made a most exhaustive search at Dover, Mr Dottleson?' he said when he had heard the whole story and the manner in which his client had passed the preceding night.

'Most thorough. I cannot think they are there, though they were too late to catch the afternoon boat.'

'It may be that taking the tickets was a mere blind. Why should Miss Dottleson not have booked through to Paris or, where not, if she actually intended going?'

Mr Dottleson had not thought of that; it was a little strange. Kate had often been across the Channel with him, and knew the saving of trouble booking 'through' implied.

'What course would you suggest, Mr Slimp? The consequences of such a marriage would be ruinous—simply ruinous.'

Mr Slimp stroked his hair up the wrong way and thought hard. 'We must advertise, Mr Dottleson, and at once.'

Blazon the wretched scandal to the world through the Agony Columns of the penny papers! That it should come to this! He laid his head upon his arm and groaned. 'Couldn't detectives do it?'

'They're too slow, Mr Dottleson; and the parties haven't committed any crime.'

Hadn't committed any crime! And they were throwing away Twenty Thousand Pounds. No crime! How could any reasonable man sit there and talk like that?

'I leave the matter in your hands, Mr Slimp; I feel myself unequal to the task of dealing with it. My daughter must be brought back, and Mrs Lamshed's money must be saved to us. Do whatever you think most advisable.'

'I will do my best,' said the melancholy man with a sigh, 'but it's a difficult case.'

Mr Slimp had not had a reassuring way with him; but he was an energetic man enough. He put the business in hand at once, and did what he thought was most efficacious. Mr Dottleson saw the result next morning in the *Times*; here it is: 'Mr M. D. of Blakewood Square, Kensington, earnestly requests his daughter to communicate with him immediately. He hereby undertakes to consider her wish if she at once returns to his care. Mr C. L. is also invited to return.'

He had hardly realised the situation until this caught his eye in the paper. He said nothing to any one, but crammed the *Times* into his pocket and drove to Lincoln's Inn. He could not put the thought which oppressed his brain into words. Mr Slimp was engaged when he reached the office; but on hearing who the visitor was, sent to request

him to come in. He went in, and found a middle-aged clergyman in earnest conversation with the solicitor. He bowed slightly to our friend, who returned the salutation with an idle glance. He had no inclination to meet strangers just now, and was a good deal surprised at the lawyer receiving himself when he had another client in his room.

'Sit down, Mr Dottleson,' said the solicitor. 'Allow me to introduce the Rev. William Wiskin, Secretary to the Central Asia Missionary Society.'

Mr Dottleson turned pale and trembled; he was face to face with the enemy.

'I had called upon Mr Slimp in consequence of the advertisement in this morning's paper, Mr Dottleson,' explained the clergyman. 'Being of course aware of the Society's reversionary interest in the late Mrs Lamshed's property, it appeared that inquiries made in its behalf might not be out of place.'

'I have advised Mr Wiskin that he has as yet no shadow of a claim on the property,' said Mr Slimp. 'We have no proof of Miss Dottleson's marriage to Mr Lakeworth or any one else, so far.'

'I trust that Mr Dottleson will not consider my call hasty and precipitate; but, as I have pointed out, the young lady *may* be already wedded to the gentleman named in the advertisement; in which case, since her father's consent has obviously not'—

His smoothly flowing speech was interrupted by a suppressed scream of rage from Mr Dottleson, as that gentleman sprang from his chair, grabbed wildly at the stationery case on the table, tore a sheet of paper therefrom and seized a pen. Not another instant should be lost; and without pausing to resent himself, he dashed off three lines of writing and signed his full name at the bottom; he added the date and, after a look at the clock, the exact time.

'My consent,' he gasped, forcing the document into Mr Slimp's hands. He had fired his last shot, and sank back into his chair, whence he fixed Mr Wiskin with a stare of impotent ferocity. That gentleman was not slow to understand the footing upon which matters had now been placed, and rose to take his leave, telling the lawyer that he should no doubt hear from him if necessary. He attempted to address a few words of condolence to Mr Dottleson; but when he looked at him, they died upon his lips, and he fled from the office, looking back more than once, half expecting to see the outraged parent in pursuit.

Mr Dottleson, however, was too much occupied with his own side of the affair to move; his anxiety lest the paper he had given Mr Slimp should prove too late, overcame every other sentiment; he hardly knew that he was consenting to Dr Lakeworth's union with Kate and endowing the latter with her grandmother's money. The Missionary Society had been nothing more to him than a name until Mr Wiskin appeared on the scene, and then its reality burst upon him with such threatening clearness that his only thought was to defeat its claim.

'If they have been married by now,' said the solicitor slowly, 'no advertisement will induce them to come back; but it's very unlikely that they would be in such a violent hurry; and

with your leave, I'll issue a new advertisement which may do more than this one.'

'Do what you think best; but for mercy's sake, let me know the very moment you hear whether that permission I gave you is in time.'

Mr Slimp promised compliance, and saw his client to the door; then he went back into his room and set himself to draw up another advertisement, which we may as well show the reader at once:

'If Miss K. D. of No. 21 Blakewood Square, South Kensington, will apply to Messrs Starbone and Smuggles, Lincoln's Inn, she will receive the written permission she requires. She must apply personally.'

The London dailies gave due publicity to this announcement the following morning, with singularly prompt results. Mr Dottleleson called at Lincoln's Inn about eleven o'clock to ask for news, and was informed that Miss Dottleleson had come to the office half an hour previously, and having inspected the document her father had signed, and received assurance that it was legally what it purported to be, had gone away in the direction of the West End—probably to Blakewood Square.

Mr Dottleleson rushed out of the office and called a cab; his excitement was rising again, for in half an hour he was to know where Mrs Lamshed's money was to go. Kate was standing at the dining-room window when he drove up and came to open the door.

'When were you married?' he demanded excitedly the instant he was inside the house.

'Married?' echoed his daughter. 'I'm not married. Who said I was?'

Mr Dottleleson sank limply into a chair, and gaped at her for three minutes before he found speech. Then he pulled himself together to perform his duty.

'Explain where you have been ever since Tuesday. What have you been doing? Where is that scoundrel Lakeworth?'

The extreme simplicity of Miss Dottleleson's explanation goaded her father almost to madness. She had been staying with her old governess, Miss Simcox, at Dover, for a day or two. It was very slow indeed down there; she did absolutely nothing. She wasn't quite sure where Dr Lakeworth was; but he said on Tuesday that he was going to Highgate for a short time; no doubt he would write when he saw the advertisement.

And this was what he had magnified into an elopement! We will not dwell upon Mr Montague Dottleleson's wrath: we will not relate how he tried to get that paper back from Mr Slimp, and how the melancholy man, as executor, would not give it up. We say that we will not speak of these things; we leave them to the reader's imagination. It was a long time before our friend recognised that he was beaten, and might as well give in gracefully; but he did so at last, and Charles Lakeworth married Kate Dottleleson with her father's blessing.

Dr Lakeworth has now a large practice at the West End, and Kate sometimes complains that he devotes more attention to his work than to her. Nevertheless, they are a very happy couple;

and old Mr Dottleleson frankly admits that his daughter's choice was a wise one, though he looks grave when you ask him about her little visit to Dover.

MACKEREL-FISHING IN SPAIN.

THE Fisheries Exhibition in London (1883) proved at least one thing—that skill in the art of fishing was not confined to the British Isles. Opportunities were afforded us of learning new and valuable methods of taking the finny treasures of the deep. These methods in some cases might be adopted *in toto*, or modified to suit the difference of climate, seaboard, and habits of the fish. We purpose in this paper to give some account of the method of taking mackerel on the south-west coast of Spain.

We had once the great privilege of sojourning for several months (March to August) in that rather warm quarter of the world. The town of Huelva was our headquarters. It is some four miles inland from the Atlantic, on the river Odiel, and is washed at every tide by the health-giving brine of the sea. It is somewhat widely known as the port from which the copper ore from the Rio Tinto and Tharsis mines is shipped. Of more interest to us—unless we are shareholders in either or both of these Companies—is the fine old Roman aqueduct of which it can boast. From Huelva, some two miles down the river, can be seen the famous Convent de la Rabida, where Columbus and the Abbot Marchena discussed the probabilities of a land beyond the western horizon; and a little farther south, the tiny port of Palos, from which the memorable expedition set out. The convent occupies the finest site of the whole region. On its western side it commands a magnificent view of the Atlantic; and doubtless here, on a lofty covered balcony, Columbus and the monks often gathered and gazed on the tempting sea. In the chapel of the convent you may have the pleasure of standing in an ancient wicker pulpit from which the renowned discoverer addressed the fisher-folk of Palos. In a somewhat small room you have fairly good representations in oil of the appearance of Colon's fleet as it was ready to start on the ever-memorable voyage.

Descending from the bluff headland, with its background of Spanish pines, on which the old convent stands, we make our way to the *lancha* that is to take us out to our summer quarters by the 'shore of the sea.' We are struck at once with the similarity of our boat to the ships in Colon's fleet. It is lateen-rigged, the mast leaning toward the bow of the boat, and having a long supple yard dipping at the bow attached to it. When you want to run before the wind, you loose the bow-line and haul the sail round square. It is a grand sight to see a fleet of fishing-boats thus running before the wind, coming towards you as you stand, near the river's entrance, on the shore. They look like so many balloons careering along the waves. The constant winds make it safe to carry a crowd of canvas, and as the boats are well ballasted, a great speed may be obtained with perfect safety. Our hand was on the tiller—we had just graduated in steersmanship—and there was a new and unguessed joy in the feeling of power guiding the throbbing thing of life through the yielding waves. To guide the gliding *lancha*

through the old channel by which Colon's small fleet sailed out to the ocean was a thing to be remembered, a 'joy for ever.'

The evening sun was dipping in the west when a Spanish friend invited us to the mackerel-fishing on the morrow. We had heard a new street-cry in Huelva ('Cavalla'), and had heard the mackerel-seller praise his fish not as 'caller,' but as 'sons of rascals,' 'capital with tomatoes.' Therefore, no second invitation was required, and the hour was fixed for the start. Before daylight (three A.M.) the Spaniard shook himself out of his blanket on the veranda outside our door, where he had been sleeping, and we were soon at the boat. There another Spanish friend—you must always call a Spaniard *amigo* (friend) and *cavallero* (gentleman)—was 'sorting' the fishing-tackle. We observed him in the semi-darkness of the morning putting several articles into the boat. First, there was a box of sand, which we thought might be intended for ballast; next, a hatchet, a large bottle of olive oil, a board eighteen inches long by twelve inches broad, some stale mackerel, and a few rods and lines. And now we were away, but only to flounder on a sandbank over which the waves were breaking. Getting off, we hoisted sail, cleared the shore, and made straight for the fishing-ground, which was some six miles nearer the New World. The wind was light, so the time was beguiled by taking an oar, singing a Spanish song, or gazing in rapture at the rising sun.

Shortly after daybreak we came to the fishing-ground, and found there some fifty boats anchored, and having a grand time with the mackerel. Our first impulse was to indulge in a hearty Scotch laugh. There, a few yards away, was a Spanish boat somewhat larger than ours, with four men sitting on the gunwale, their feet dangling to the water. They had each a short cane-rod about four feet long, with a yard and a half of stout line finished off with a couple of hooks. Picturesque fellows they were, with their brown *sombreros* (broad-brimmed hats), dark-blue pantaloons, short pale-blue jerkins, bare feet, and the universal *faja* (a long strip of cloth, generally red) encircling their waists. When one caught a fish, he made it spin into the air right above his head, so that in its descent it passed his left shoulder. As it came down, he struck the line sharply above the fish with the forefinger of his left hand, thus instantly freeing the hook, and the next moment dashed hooks and line again into the sea. And so deft were they in the art, that a fish was always in the air!—sometimes two, for they often caught two at a time. After our face had contracted a bit and had regained its natural and customary expression, out went the anchor, and the rods were in hasty requisition.

On our way out, whilst we had been singing, semi-gazing, or occasionally pulling an oar, one of our friends had been chopping into mince-meat the stale mackerel we had brought, mixing it with sand and olive oil. A handful of this mixture was now scattered on the water, and we all looked eagerly for signs of fish. There they are! In go the lines with a dash, and up comes the first fish to our line. 'Ave Maria!' says Manuel quietly, and waits his turn, whilst we clumsily cleared our hook. It was well for us that Manuel was a bundle of good-humour, for during the

first five minutes our fish were alighting everywhere—on his head, neck, shoulders, and, for a change, sometimes in the sea on the other side of the boat. Once, too, we fared badly. A fish was in the air right above our head, which noble member, scornful to be bespattered, went smartly on one side, but only to make a nice space between our neck and collar, into which the glittering sprawler swiftly dashed.

A handful of lurement thrown out occasionally soon gathered a fine shoal of fish about the boat. We could see them in dozens darting at the chopped fragments of their relatives. Our lines and hooks were unceremoniously dashed in among them; and so well did we do, that even at our boat a fish was almost always in the air. We did not always put on bait; the bright hooks were enough. The noise in the boat became tremendous, so many tails pattering in concert on the bottom. It certainly was novel sport, just exciting enough to rub away for a time the effects of the early summer heat. By eight o'clock the sun was uncomfortably hot, so we furl'd up and stood for the shore with seven hundred and seventy fish, and were in time for late breakfast. The odd seventy were distributed among the families; the seven hundred our Spanish friends sold, and in the evening handed us a magnificent 'basket of summer fruit'—figs, apricots, mulberries, &c.—as our share of reward for the morning's toils.

That was our best day's fishing. Diminished in numbers, the mackerel were steering northward, mayhap to visit the cooler waters of the British Isles. But our best take was far behind the other boats. We could count a great part of their catch from the shore; for the Spanish fishermen strung the fish in fifties and hung them over the side of the boat. To keep them fresh, one man on each side kept drawing bucketfuls of sea-water and pouring it on the fish. Some of the boats were covered from stem to stern with strings of fish, and these were all taken with rod and line in the manner we have described.

THE MONTH:

SCIENCE AND ARTS.

WERE it not for the wonders which are achieved constantly by modern engineering, it would be thought that there is one difficulty at least in the way of completing the Manchester Ship Canal which can hardly be surmounted: this is represented by the necessary removal and reconstruction of the aqueduct, made by Brindley, which carries the famous Bridgewater Canal across the river Irwell at Barton. As the level of this old canal must be left undisturbed, and as at the same time it must be removable at times, to permit the passing of masted vessels on the new waterway below it, it is intended to make a swivel aqueduct of it, so that, when required, it can be bodily thrust aside. It is also contemplated to transfer vessels from one canal to the other by means of an hydraulic lift.

In the course of recent excavations among the minor pyramids and burial-places of Egypt, Mr Petrie has made a curious discovery, which promises to be most useful to students, as pointing out a fresh source of papyrus records. A large

number of mummies are decorated with head-pieces made of a material which is technically known as 'cartonnage,' and which generally consists of layers of coarse linen glued and pressed together and coated with stucco. But in the mummies of a certain period Mr Petrie has found that this cartonnage, instead of a foundation of linen, is made up of layers of papyrus, waste documents which have found their way to the undertaker. These layers can easily be separated by soaking in water, and are in a perfectly legible condition.

At last there is a near probability of the Metropolis being lighted by electricity, and as a matter of fact, the huge city has been divided for this purpose into districts, each district having been allocated to an electric lighting company, in order that the necessary works may be proceeded with. The gas companies are doing their best to stem the tide which threatens their interests, and in order that they may have a stronger hold upon their customers, are offering to supply them with heat as well as light upon liberal terms. In a circular which we have perused, issued by one great company, the offer is made to supply cooking-stoves almost at cost price, to lay on the necessary pipes for them, and to fix connections free of expense to the consumer. Whatever electricity can do for us, there is certainly no immediate prospect of its being able to cook our dinners, whereas gas we know will do it well and cheaply. The companies are therefore wise in endeavouring to open up this new source of revenue; but they would have been wiser if, a few years ago, instead of opposing 'the light of the future,' they had taken it up and made arrangements for its distribution among their clients.

It will be remembered that four or five years back one of the numerous lightships which protect shipping from the rocks and treacherous sandbanks that dot our coasts was connected with the shore by a telegraph cable, so that signals for help—invisible to those on shore—could be quickly advertised to the lifeboat crews and others concerned. A Committee was appointed to report upon the advantages of the system, and their Report has just appeared as a parliamentary paper. After five years' experience gained in the manner described, the Committee have come to the conclusion that the expenditure involved is not commensurate with the advantages gained, and they not only, therefore, recommend that the electrical communication should be discontinued with regard to lightships, but that it should not be extended to lighthouses. At the same time the Report is not unanimous, for one dissentient, in the person of Sir Edward Birkbeck, M.P., is of opinion that a much more extended trial of the system should be carried out before a decision is arrived at.

In an interesting Report on Brazilian trade, the Secretary to the British Legation at Rio de Janeiro gives some information as to the best means of cultivating trade with Brazil, which British manufacturers would do well to study. The writer of this Report complains that our manufacturers do not meet the requirements of the markets with which they deal, but stick obstinately to their own ideas, losing trade, and giving opportunities to other nations to take their places. As a case in point, cheap cutlery is

mentioned; and it is stated that Sheffield cutlery having so far met the demand for cheapness with refusal and disdain, another manufacturing country has taken their place. It is further stated that in dealing with Brazil even the commonest article should bear some kind of ornament. This addition, although quite a superfluity, as we should think, has a great attraction in the eyes of the natives, who will not buy unless the article is showy. The same feeling applies to packages of laces and all textiles, the outsides of which should be adorned with showy labels, &c. If, therefore, our manufacturers wish to do trade with Brazil they must set aside their ordinary ways of dealing with fellow-countrymen, and make their wares more attractive to the eye.

Dr G. F. Brush, of New York, has collected a large number of statistics, by which he seeks to prove that tuberculous disease in man is closely connected with the same disease in cattle. This theory is contrary to the view generally held, it being supposed that, owing to difference in normal temperature, transmission of phthisis between man and beast would be next to impossible. But Dr Brush's statistics show that where cattle are common, and dairy produce necessarily forms a regular part of the daily food of the people, there may be found the victims of consumption. In other districts where the dairy cow is absent, there is also an absence of phthisis. Statistics are notoriously uncertain in the evidence which they afford, and further inquiry is needed before the theory enunciated by Dr Brush can be accepted.

Putting aside all theories with regard to the infection by impure milk of any particular disease, it would seem that the condition of the household milk-supply is a far more important subject than that of water-supply. In our present ignorance of the way in which disease-germs affect us, and with the certain knowledge that they are mostly rendered inert by being submitted to a high temperature, all householders should make it the rule to have the daily supply of milk scalded before it is used. Some persons, especially children, will turn against milk which has been so treated, and complain that it is disagreeable and insipid. It does certainly acquire a peculiar taste; but this can be corrected if, when the milk is heated, it has added to it either a little salt or a few lumps of sugar.

We are very glad to see in a contemporary, *The Sanitary World*, allusion made to that unaccountable dread of night-air which has done and is doing so much mischief. 'What can we breathe at night,' it is asked, 'but night-air?'—the choice being between the contaminated air within the house and the free pure air without. It is always a difficult matter to trace back the origin of a popular delusion, and how this wonderful prejudice against night-air arose it is impossible to say; but we may safely relegate it to those ages when darkness was a synonym for all kinds of imaginary fears. In a city, it is quite certain that the air at night is in a far purer state than it is by day. It is also certain that if we all made a rule of sleeping with open windows, we should be far freer from disease than we now are. But the prejudice is not confined to night-air, for we have all had experience of the horrible atmosphere of a closed tramcar or other public vehicle, owing to

the fear that the majority possess of breathing the fresh air.

The proposal to gild the outer surface of the dome of St Paul's is one of those things which seem to be revived at stated times, to be as often put aside and forgotten. The suggestion is not one that is likely to commend itself to a practical people, for it could only be carried out at the expenditure of about fifteen thousand pounds, nor would artists be inclined to agree that the beauty of the cathedral would be enhanced by the change. The metropolitan church has a beauty which is distinctive, and it seems a pity that it should be interfered with. Moreover, the worship of mammon is prominent enough already, without being typified in the way suggested. The proposal has been made that the ribs of the dome only should be gilded, after the manner of the cupola of the Invalides in Paris, and that in order to judge of the effect, a few of these ribs should, as a preliminary step, be covered with imitation gold (Dutch metal), so that artists might judge of the effect.

At a recent meeting of a Medical Society in New York, a few unusual cases of lead-poisoning were discussed by members under whose personal notice they had been brought. In the first case, a man who had been employed as a florist had shown marked symptoms of lead-poisoning after having been in the habit of biting off the ends of the tinfoil used as wrappers for bouquets. (So-called 'tinfoil,' it may be mentioned, contains far more of the metal lead than it does of tin.) Another man was afflicted with the same symptoms owing to having been in the habit of drinking beer from bottles which had been cleaned with lead-shot. Other cases were cited where the mischief had occurred through chewing tobacco which had been wrapped in tin or lead foil, or from drinking beverages from bottles having patent stoppers in which lead formed the main constituent. A case lately came under our own notice of a lady who was lead-poisoned through the use of the spoons and forks at a seaside lodging.

Those who are acquainted with the past history of London will remember that there existed at one time a number of tributaries to the Thames which flowed through the city. The position of some of these may be traced by the names which they have conferred upon the thoroughfares near which they once ran; thus we have the 'Wallbrook,' the 'Eyebourne,' the 'Fleet,' &c. It is interesting to note that the outlet of the spring which fed the last-named stream has recently been rediscovered while certain building operations were in progress near the famous Coldbath Fields Prison, which is now turned over to the service of the Post-office. A portion of one of the wharfs which lined the stream has also been uncovered, and the timbers, although black with age, are in a fair state of preservation. From their size and solidity, it is inferred that vessels of quite a large tonnage found their way to this spot, a mile north of the river Thames.

It seems almost hopeless to attempt to grapple with the great question of disposing of the sewage with which the noble river Thames is so choked that in some places below London Bridge it is little better than an open drain. Many systems have been proposed, and much money has been spent, but without any apparent result. We are

of opinion that the work is too vast to be successfully undertaken as a whole, and that the problem must be attacked in detail and before it begins to assume such monstrous proportions. For some time past a method of dealing with sewage has been in successful operation at Kingston-on-Thames, which from its simplicity is called the ABC method. By this system the liquid sewage is treated by chemicals other than lime, by which it is purified, and solid matter is thrown down to be ultimately dried, and sold for an excellent manure at seventy shillings per ton. The effluent water is afterwards poured out into the Thames in a clear and inoffensive condition. This process is worked by the Native Guano Company of 29 New Bridge Street, Blackfriars, London.

A writer in an American paper gives a description of the manner in which the bison has in a little more than twenty years been almost extirpated. He tells us that in 1866 large firms organised hunting-parties, and paid two and a half dollars for every bison as he lay dead on the plains. The professional hunter used to hunt on horseback, and as he approached closely enough to the bison to almost touch the animal as he rode by its side, he fired the fatal bullet, and the animal fell. He himself has killed more than a hundred bisons in one day, hunting in the manner described so long as the horse he rode could keep up. A few years afterwards, improved rifles were brought forward, and the slaughter was conducted in a different manner. The horse assisted only in finding the herd, after which the huntsmen would take up a position on the leeward side nearly a mile away, and pick off the animals one after another as fast as they could reload. The result of this wholesale slaughter is stated in a pithy manner, which, however, suggests exaggeration, the writer telling us that in one district, at the close of one particular winter a man could travel fifty miles in jumping from one carcass to another. The skin was the part of the animal which was valued.

Seven years ago, a geological map of France was commenced on a scale of 1-500,000, which, according to all accounts, must be the finest work of the kind ever undertaken. It is now finished, and consists of forty-eight sheets. The system of colouring adopted is that which was recommended at the Geological Congress held at Boulogne in 1881. It will now probably become general in all other countries, to the great convenience of students. Using thirteen primitive colours, fifty distinct tints can be obtained by superposition or difference in intensity of tone. The Sedimentary Rocks are coloured according to the tints of the solar spectrum and in their regular order. Thus, the Trias is coloured violet, the Jurassic blue, the Cretaceous green, &c.; and each shade is expressed in deeper shades when it is required to indicate that particular rocks of the system are of more ancient date. The Eruptive rocks appear in different shades of red, which arrangement seems to be appropriate to them; while the Carboniferous group, following an old custom, are expressed in shades of gray and black. This sensible plan of defining differences which can readily be appreciated by the eye will most certainly help on the study of geology generally.

Automatic sprinklers, which are constructed to pour a continuous rain of water upon an incipient

conflagration, and so overcome it at a period before it has become unmanageable, have of late years become common adjuncts to business premises. But they have one disadvantage in continuing their deluge until stopped by hand, so that we can conceive the possibility of an undiscovered alarm leading to more injury from water than from fire. A new form of Fire-check, which meets this difficulty, has recently been brought forward by Mr Dowse of London. In this apparatus the water is a fixed quantity, held in a container of metal, and is charged with soda bicarbonate. Hung in the centre of this vessel is a bottle of strong acid, containing also an electric fuse held in a glass tube. The containing vessel is fixed on or above the ceiling of the room requiring protection, and its lower part terminates with two roses much like those attached to watering-cans. In connection with the apparatus there is also a very sensitive thermometric arrangement which causes the contrivance to act whenever the heat in the room reaches such a temperature as would be caused by actual fire. When this occurs, the fuse explodes, shatters the acid bottle, so that an enormous mass of carbonic acid is generated in the containing vessel, with the result that both water and gas are discharged in all directions. No conflagration would withstand such a deluge for more than a few seconds.

An engineer of Chicago has proposed a system of elevated railways for that city, the lines to be at a height of one hundred and twenty feet above the pavement, so as to clear the roofs of the largest houses. This plan is put forward chiefly on account of its non-obstruction of the light, and also because its noise will not be so troublesome as that of a railway at a lower elevation. The passengers would be raised to the aerial stations by means of lifts. This plan is never likely to be carried out, if for nothing else than that it would quite destroy the architectural features of a city. It is far better to keep metropolitan lines below ground and out of sight as much as possible; and although the unhealthiness of a vitiated atmosphere may be pleaded, every one knows that fresh air can be secured in the tunnels if only the directors of the railway will go to the necessary expense.

The Society of Arts have done well in offering prizes for specimens of wrought-iron grilles, a mode of window decoration which is not only ornamental by day, but which affords far greater protection by night than the usual clumsy shutter system. The blacksmith's art has far too long been represented in this country by articles which, however necessary and efficient for their purpose, exhibit no kind of taste or design. It was not so once, as many old specimens of wrought-iron work bear witness. The revival of this beautiful form of art is much to be desired, and the present offer of prizes has, we learn, brought forward an amount of technical talent of a very high order. That this is no idle statement is proved by the three window grilles which have won the prizes offered, photographs of which are reproduced in the Society of Arts' Journal.

Attention has recently been called to the preservative qualities of soapstone. This material, which is commonly seen in this country merely as a vehicle for rough models, generally brought from China, has great power in withstanding

atmospheric influences; and a preparation of it can be easily applied to metal-work so as to preserve it from rust. In China it is used for protecting buildings in which sandstone and other friable materials have been employed; and it has for years been common to preserve buildings by giving them a superficial coating of the substance. The process might with great advantage be tried on the crumbling stonework of many of our large towns and cities, where fumes of all descriptions, added to the natural action of frost, rain, and sunshine, are gradually disintegrating the masonry.

AT DAYBREAK IN LONDON.

We doubt not there are many people in London that have never walked its silent streets at day-break; and many residents out of town that would like to know what aspect the streets of the greatest city in the world present at this early time of day—hence this paper, which was written after a ramble through the streets one Sunday morning. Sleeplessness and a bad headache induced us to turn out of bed, dress, and slip quietly out into the street about half-past three o'clock. Daylight had fairly broken out upon the sleeping city; and inhaling the keen morning air, we went in the direction of the river. As we passed down Southampton Row and Drury Lane, we met about four persons, two cabs, and thirty cats. Cats and waste-paper seemed to have taken possession of the streets; and with what a reproachful look these cats eye you, as if they highly resented your intrusion upon their domains at that early hour. It was a trifle uncanny walking down Drury Lane with only black cats, waste-paper, and a dark form huddled together in its rags here and there up a side-court for company. From Drury Lane we reached the Strand.

What a contrast the Strand presented now to what it was at midnight, when the theatres had poured out their thousands, and the restaurants or bars had disgorged their votaries into this important highway, teeming with human beings, some hurrying homewards on foot, others trying to obtain a seat in an omnibus, or hail a cab, or hurrying off to catch a train, amidst the yelling and shouting of men selling extra-special editions, and the whistling and shouting for carriages and cabs. Now the stillness and the deserted appearance strike one vividly, for you see the curves, elevations, or declines of the roadway, which it is impossible to notice when covered with teeming life and traffic; and no life to be seen excepting a few men busy in curling the Sunday newspapers, and a slouching man or two, the inevitable man in blue, and a very sleepy-looking cab-horse, attached to its vehicle, wherein the driver was fast asleep.

We turned down Wellington Street to Waterloo Bridge, where we stopped at the coffee stall and awoke the old lady there, who was snatching a short period of sleep. How well practised these women must be to be able to sleep, and awake every few minutes on hearing the footsteps of customers! Her helpmeet was there also, and we tried to engage him in cheery conversation; but he would not be wooed that way, for, mumbling an incoherent reply in a grumbling tone, he fell

at once into the arms of Morpheus. Dickens's fat boy should have kept a coffee stall.

We descended the steps of Waterloo Bridge and walked on to the Embankment. There, an interesting scene—at the same time inconsistent with our advanced views of humanity—drew our attention. Reclining on the seats by the river, in all sorts of positions, were men who could not afford to pay for a night's lodging. Some seats were occupied by persons sleeping in a perfectly upright position; others were shared by sleepers more fortunate than their fellow-outcasts in annexing places, for some had half a seat to lay their careworn bodies on, and hugging their rags, endeavoured to close up the air-holes. As we passed by each seat of outdoor sleepers, who preferred, or had to prefer the cool shroud of Nature's covering to the stifling rooms of common lodging-houses, some of them were stretching their arms and legs; and one young man was actually absorbed in the pretty lyrics of the opera *Dorothy*. One seat was occupied by four awakened politicians, engaged in an argument on the amount of German blood in the royal family. Would our Queen feel flattered to know that four of her humblest subjects, with hardly a copper in their pockets, had still interest enough in imperial affairs to criticise her family and court at four A.M. on the Thames Embankment?

Westminster Bridge was now in our immediate vicinity, and stepping on to the bridge, we looked away out to the far east, and watched the rising of the sun behind the great dome of St Paul's. Here was a modern day picture for any artist to paint. A cold gray colouring pervades the whole scene, the gray stonework of the bridges and Embankment, the gray colouring of water touched up with the reflection of the little fleecy golden clouds stretching across the pale-blue sky, which received their delightful tints from the golden rays shot up from behind the sombre dome of St Paul's. The whole scene, was indeed charming in harmony of colour—cold gray, lit up with gold. In this study of early morning tints, the artist who will paint this scene must not forget the human element in it—a scene more impressive than colouring of light, stone, and water; for there, against the end of the stone parapet of the Embankment, on the top of the steps leading down to the river, stood a haggard-looking young man, and at his feet sat his wife and two infants. He looked as if he had stood there on guard the whole night, with contracted brows, and now fiercely staring at the rising of the sun in the east. Perhaps that golden ray of light was the only sign to him of God's presence in the whole world. But it was touching to see how this hard, fierce-looking man, out of work and moneyless, gently propped up his infant child as it showed signs of dropping forward in sleep against the cold and hard buttress.

Should this meet the eye of some thinking philanthropist, we trust he will see what a splendid opening there is here to effect a real and lasting good to the poor outcast humanity of London. A large building might be erected in this city with washing facilities, so that these poor persons might obtain a night's lodging for a penny and a thorough wash in the morning. This healthy arrangement might relieve the work in London hospitals.

Turning our back to the bridge, we passed by the Houses of Parliament and the Abbey, and so emerged into the side-walks of St James's Park, where everything looked beautifully fresh and green; and we passed through Spring Gardens, and issued out into Trafalgar Square. Here, too, had men and women been sleeping, and some were now performing their morning ablutions in the fountains; and some were slouching off in all directions. But where do they slouch to? We must say slouch, for verily they do slouch, dragging one leg wearily after another, with hands embedded in the bottom of their pockets, without seemingly the least idea or care where they go to.

In the Strand, on our homeward way, we saw a pitying sight—an intoxicated woman well advanced in years, with haggard face and bleared eyes, and dressed in black rags and crape. Drunkenness and vice were written in every line of her face and in every curve in the folds of her dress. All the men and women we had met this morning had an appearance of health and strength enough to go on battling with in this world; but on this poor aged creature, hopeless despair in this world was branded.

One pleasing sight we must mention in conclusion, and that was the little birdcages hung outside the windows of the Industrial Buildings in Drury Lane; there the little songsters were welcoming the coming of day with thrilling delight.

K I R K W A L L.

A SONNET.

FAR by the margin of the Northern seas,
All heedless of the pulse of passing feet
Which throbs in sluggish life along her street,
She sits beside her ruined palaces,
A sad gray city crowned with memories,
Hearing her old Cathedral bells repeat
The death-knell of the days, which, clear and
sweet,
Trembles and dies each hour upon the breeze.
Her heart is with her forgotten dead;
The jarls and vikings who of old went forth
Under the raven-banner of the North
To fill the southern seas with wondering dread—
In dim strange murmurs, faint and far away,
Rise through her dreams the voices of to-day.

FROM OUR TERRACE ON THE GRAND CANAL.

No better post of vantage could be imagined whence to observe the life and manners of the Venetians than the big terrace of the old *palazzo* on the Grand Canal which we inhabit. It being on the 'wrong side' of the watery street, and just in the middle of its first bend, we command a fine view of the double sweep of water—from the Riva degli Schiavoni, with its orange-coloured awnings, and the gorgeous sails of the Chioggia fishing-boats, to the modern iron bridge that has dared to cross the same Canal that is spanned by the historic arch of the Rialto.

There is a feeling of satisfaction in living in one of the real palaces of which we have read so much, instead of being in a new-fangled, square-built, commonplace lodging. It is true our walls are rent, our marble balustrade is cracked, the delicate outline of our 'dog-tooth' cornice has crumbled away, the cusped arches of our tryptich-like windows have been filled up with bricks, our mosaic floors are all cement and no mosaic, our fine damask and satin hangings are faded and worn, our ancestral portraits have great triangular tears all over them, out of which tumbles the dust of ages each time the wind blows to a door; still, no one can deny that it is a palace—the very ruin of everything within goes to prove it. Then, too, it props up, and is propped up by, one of the loveliest Lombardic buildings in all Venice; so our abode acquires a sort of extra glory from its neighbourhood and from its need of us.

Our apartments are on the first floor, the *piano nobile*, as it is called, from being that specially reserved in all these old palaces for their noble owners; whilst the upper floors were occupied by the household and retainers; and the lower one, the front of which was generally an open arcade, was used as lodging for the gondoliers, for cellars, grain and oil stores, and for the bouthouse. Our palace is built thus; and our rooms are reached by three separate staircases, the grand one, and by two others that come out at unexpected places,

and disappear in locked cupboards and dark passages, very suggestive of romantic adventure.

The first sign of life on the Grand Canal in the early morning is the passing by of long barges laden with green vegetables and fruit from the low flat island of Mazzorbo, and destined for the market at the Rialto. One such has passed as we write; its sail is of a rich Indian-red with a dark-blue tip, a fillet-work border running round it, and in its centre a design in orange of St George and the Dragon. The big rudder is gaudily painted in green and white, and has a picture of the Madonna on the part that is above water. The men who are poling the barge along add to the variety of colour by one of them wearing a pink shirt and purple trousers. The whole thing, together with its green load, looks, as the first rays of the sun glint upon it, like a bit of a broken rainbow that has dropped into the Canal and is drifting along on its eddies.

Now comes a barge heaped up with coal; now one with bales of cotton for the factory lately established here. This is followed by another whose cargo of square white deal boxes is guarded by a soldier at each end of the boat, and the red flag that floats over it tells us that it is dynamite that is passing by. Of a more peaceable sort is the next that we notice. A small flat boat, hardly more than a curved board, is propelled by two tall brown-robed figures, two Capuchin friars, who, with bare heads and sandalled feet and with cords girding their waists, are off on a begging expedition, hoping to return with their Franciscan cane-basket filled with good things for their monastery's fare.

Presently a *barca* approaches the stone landing-place beside our palace. This *barca* is a plainer sort of gondola, without its graceful, dignified, steel prow. Out of it come, tumbling over each other, about fifty soldiers. An early-astir itinerant seller of an Italian 'Complete Letter-writer' with a quick eye to business, who happens to come up, seizes the opportunity, and in a moment his bag is open. He pulls out a heap of books,

and with ready wit reads a suitable sample of the contents of his book: 'Letter from a soldier in Abyssinia to his brother in Italy.' In an instant the soldiers are crowding round him, listening with interest; many producing the few coins with which they can become possessors of the little manual, which they scan eagerly for something to fit their own particular case as they are hurried away up the narrow lane.

But our attention is diverted from them by the stately advance of a gigantic stack of fresh green grass, apparently resting on the surface of the water. The flat barge on which the stack is placed is completely hidden by the drooping grass, and only the tip of the tall mast projects through it. On this is fixed a small sail, which looks like a pocket-handkerchief on a walking-stick. From a space at the stern, hollowed away in the stack, rises a column of white smoke—an odd place in which to be roasting coffee for breakfast! This grass comes from Torcello and from the valleys of the Friulian Alps, and is for the sustenance of the cows of Venice. These pass their lives in dark stables, and are almost the only animals in the town. It is true that both dogs and cats are to be found if you know where to look for them. These latter are sometimes to be seen peering through the gratings of the damp cellar-like ground-floor rooms in the narrow lanes, where they look as if they are suffering imprisonment under the Inquisition, so dejected an air have they. The cat is much in favour with the lower classes here for more purposes than one, as we learned from a Venetian friend. He said that in the winter he finds it difficult to keep a cat about his place, for it is sure to be stolen by his poorer neighbours to eke out their stock of food. 'And no wonder,' he added; 'for I can assure you that if kept in snow for two or three days after being killed, cat makes a very palatable dish.' The dogs are almost exclusively to be found on the great lateen-sailed boats that bring cargoes of wood from the Alps of Cadore and charcoal from Istria and Dalmatia. These dogs are taken on shore so rarely that, should one be seen running through the streets of Venice, it would be apt to be thought mad, and treated accordingly.

But we have rather wandered from the Canal. Now we see coming from the direction of San Marco a large flat *barca*, with a square cabin taking the place of the black movable cover of the gondola. Its windows are small, and are strongly grated with iron. This, as well as the presence of four or five big armed *carabinieri*, tells us that the boat has come from the prison near the Doge's Palace. By the exertion of a little imagination, the dark figures behind the iron bars become Silvio Pellico and his friend on their sad journey to the prison in the castle of Spielberg.

Of a very different character is the next barge that comes gliding along, its big sail catching the breeze that has just sprung up, so that the man at the stern with his long lithe oar has only to rest and act rudder. Heaped up in wonderful confusion are beds, tables, chests, bundles of

clothes, piles of plates and dishes, old pictures, and a sort of shrine with rusty sconces and a brass hanging lamp; whilst at the prow are half-a-dozen women and children eating their breakfast of *polenta* as they sail along. It is a family moving bodily to a new abode. As the old and the new door-steps are both washed by the water of canals, no need for packing up or neat arrangement of goods. When the barge came to the door, all that had to be done was to trundle everything into it, lighted charcoal stove and all, and shove off.

As morning advances, life becomes very busy just under our windows. Our abode is at a corner between the Grand Canal and the narrow lane of which I have spoken. This lane ends in three little wooden piers, that jut out fan-like into the water, and here there are moored by night and by day eight or ten gondolas, for at this spot is one of the many ferries by which the wide water-way can be crossed. By night only two sleepy gondoliers are on duty to carry over belated wanderers; but now the bustle of the day begins, and the boatmen, collecting one by one, are soon at work setting their gondolas in trim order. There is much sponging of their shining black surfaces, and beating of their cushions and small square carpets, and great polishing up of the brass knobs and plates that give brightness to the uniform black of the boats. On the opposite shore is another set of piers, where you land in a wide open space called a *campo*, in front of a church. This *campo* in old times having been a green field the term is still given to the stone-paved piazza. A memory of the past greenness remains, however, in the shape of a broad spreading vine supported on poles and trellis-work, which forms a cool bower, in which, shaded from the hot sun, gondolier and passenger alike can rest. Beneath this bower is a small wooden shrine, whose doors stand open, showing a picture of the Virgin and Child.

The doings of these ferry-gondoliers are a constant source of interest and amusement to us. From our terrace we get to know by sight the wives and children, who come twice a day bringing them their meals. The women, with their coloured shawls gracefully draped around their heads and shoulders, remind us of the East; and no doubt this mode of wearing it comes from the veil of those lands with which old Venice had such a close connection. Fifty gondoliers with their boats are appointed by the municipality to this particular ferry, and, while free to serve some of the hotels near by, and get what custom for long and short distances they can, are bound to be always in sufficient numbers at the ferry to carry over without delay all those desiring to cross. The charge is only one *soldo* (a halfpenny), not a heavy fare; but the working classes do not even pay this, the gondoliers being often content to receive from them two-fifths of this small sum—two *lombardi*, as they are called. These tiny coins, which never come within reach of the ordinary traveller, are signs of the poverty of the lower strata of Venice life. We have often been pleased to see how little greedy are these gondoliers, who are apt to get from travellers the reputation of being rapacious. Continually, when we have crossed, our boatman, on the strength of the full fare having been paid by us,

would call in some poorer brethren and carry them over for nothing.

During the day our ferry landing-place is frequented by various itinerant merchants. One girl, with the braids of her hair twisted like cockle-shells on each side of her head, and her wooden shoes tied with red and blue ribbons, comes crying, 'Bestie, O le belle bestie!' (Beasties, O the beautiful beasties!); these 'beasties' being an odd crab, peculiar to Venice, which has a huge bunch of red coral nearly as big as itself. They are sold at from one to three *soldi* each. The men are very fond of them, and sit on the railings of the piers with their heels tucked into the crossbars, nibbling and munching away at the pink claws half their off-time. Then the *aquatolo* finds them out, and tempts them from their crab-sucking by his cry of 'O la freschezza! O la purità! O la bibita aristocratica!' (O the freshness! O the purity! O the aristocratic beverage!) as he sets down in their midst his covered pail of iced water and his gaily-painted tray on legs with its bottles and glasses. This stand is generally embossed all over with fancy-gilt nails and old coins, and with brass and iron figures and glittering curiosities. The bottles contain sweet sirups and lemonade, and, alas, too often, *graspa*, the worst enemy of the Venetians. This *graspa* is a spirit extracted from the refuse grapes after all the juice has been pressed out. It is of the nature of fusel oil, and is even worse in its effects on the drinker than the French absinthe. We are happy to see, however, that 'our ferry' is pretty abstemious on the whole. At times the men seem on the brink of assaulting each other, so fierce rages the battle of vituperation and gesticulation; but it all means nothing, and five minutes later they will be sitting with their arms round each other's necks.

Once a day at least our ferry is visited by a *barca ristorante*, a broad flat-bottomed boat, in which stands at one end a huge bowl of macaroni, covered with a bit of blanket to keep it hot. Near it is a big pan, standing on a charcoal stove, in which fish of all shapes and kinds are frizzling—from innocent sprats to pulpy Victor-Hugo-like devil-fishes, with their long finger-like flaps and suckers; and the cuttle-fish with its sepia bag; and one white bone. Awful creatures these, that nothing but starvation and despair would, you would think, induce any one to touch! Here, however, they are necessities of life, and the *ristorante's* small stock is soon exhausted. A barrel of wine in the prow and a big basket of rolls complete the stock-in-trade—and all,' says our gondolier Pippo, 'for next to nothing.'

Pippo is a tall spare-built young fellow of twenty-eight, with hair and moustaches of the sunniest hue. The old-established notion of dark-haired Italians is only in part a true one, for here in Venice you meet almost as many golden or red heads as in England. We learned from Pippo that his gondola cost him about fifteen hundred francs when new, and that it will last good for only about ten years, so that if his food is cheap the implements of his industry are dear, all the more that the flat bottom of the gondola gets so clogged with barnacles and sea-weed that the boat has to be shored and scraped every month,

and during certain months every fortnight. The brass ornament which secures the arm-cushions, and which is the chief decoration of the gondola, suggests the origin of the shape of the boat itself—the sea-horse, which abounds in the lagoons of Venice; the upright steel prow, with its dignified bearing, being modified from its head, and the small curl of steel at the stern answering to its tail. That in early times all ships were fashioned after the forms of aquatic birds and beasts is very apparent to any one who sees the small craft in the Greek and Turkish waters; often the prow prolongs itself into the head and long neck of a sea-serpent or of a swan, the great side rudders being like a splay foot or a fin. Then here in Venice even the coal barges have all large eyes sculptured or painted on them, the iris being a hole through which runs the cable. The smaller barges often have but a dab of white paint, but you cannot fail to recognise the rudimentary eye.

But now the boats at the ferry all seem seized with a sudden frenzy. The water swashes up and down over the steps, and the gondolas are sent bumping against the piles that stand in the water round the piers and the *palazzo* door-steps. One of the small canal steamers has passed rather nearer inshore than usual, and has caused by its swell all this confusion. There is a terrific exchange of abuse shouted in stentorian tones, which gradually calms down as the steamer gets beyond shouting distance, and the word-eddies and the water-eddies die out together. Theoretically, for poetry's sake, we are bound to lament the presence of these steamers on the Grand Canal; but, shall we own it? in practical life we are most grateful to them, as, indeed, are all the Venetians. They are trim, well-behaved boats. They consume their own smoke, and go on their way inconveniencing no one and helping many. There is an idea that they must take work from the gondoliers; but this is a mistake, for the class they chiefly carry never enter a gondola at all. In a city where the average worker, whether man or woman, only gets one franc a day, few of the lower classes could afford a boat that costs a franc an hour. Then the visitors, to whom seeing Venice means gliding about its picturesque canals in a gondola, have little occasion or temptation to use the *tram-via*, which is the very odd name given by the Venetians to the steamboats. So they are mostly useful to the very numerous poorer classes. Some old folks who, living in the extreme north and north-west of the city, have actually never been to the centre, are now able at last to make the journey all the way to San Marco!

The next thing that catches our eye, as we sit during afternoon tea on our terrace, is an elegant landau. It has a blue body and red wheels, and is poised between the seats of a wide barge, which bears it, as if in triumph, along its unaccustomed road. Great is the astonishment its appearance creates amongst our gondoliers. Whence it comes and whither it is going in this city of watery ways and staircase bridges is a mystery. Not less odd is it to see, following the landau, two sentry-boxes going up to the quay by the *Dogana del Mare*; and in the distance, gliding lightly over the rippling waters of the Giudecca branch of the canal, three massive new railway carriages.

But in our observation-making and our sketch-

taking the day has slipped by; and as we finally step in from our terrace, the last rays of the sun are setting a burnished crown on the campanile of San Marco, and touching as with fire the golden wings of the angel on its summit.

JOHN VALE'S GUARDIAN.

By DAVID CHRISTIE MURRAY,

Author of 'VAL STRANGE,' 'JOSEPH'S COAT,'
'RAINBOW GOLD,' etc.

CHAPTER XXXVII.

TOBIAS, being now a gentleman at large, and having reached that blissful lubberland of *dolce far niente* towards which he had all his life long looked with yearning but hopeless eyes, it seemed to him the most natural and befitting thing in the world to settle near the scene of his discovery and to pose there as a personage. The public-house was the readiest place to pose in, but his mind ran away from the thought of its temptations as a whipped dog runs from a shaken stick. He took cheap lodgings in a labourer's cottage, and hoarded up a whole half of his weekly income.

A few months ago he would have spent his last threepence on rum without so much as troubling to ask where the next might come from. Now, with that suddenly developed eye for the future, he began to exercise a thousand mean precautions. The summer was barely beginning, but beyond the summer, winter lay, and he looked with dreadful prophetic eye towards the time of rain and snow and cold.

'I ought to be supplied with coal for nothing,' said Tobias; 'but I am too well acquainted with the heartless ingratitude of men for that. I shall be expected to disburse a pecuniary consideration for it.'

He began betimes, therefore, and was at all hours to be seen prowling about the roads on which the coal-wagons travelled. He carried with him a tattered old carpet-bag, and stooped for any fragment of coal which had fallen, if it were no bigger than a hazel nut. Rotten branches, bits of stick of any sort, found their way into this receptacle, and at night he would sometimes empty out half-a-dozen pounds' weight. From the time of the beginning of this habit, nobody ever saw Tobias without the carpet-bag, which he lugged about with an unflagging industry.

One fine day he found himself by a breach in the hedge beside a great mossgrown wall, and seeing a biggish handful of half-rotted hedge-stakes, dry and ripe for burning, within reach, he took a cautious look about him and scrambled through the breach. The land sank here, and was thick with brush and bramble; and lying there, hidden for who knows how many years, were the remains of an old gate, which had fallen almost to matchwood. Tobias went for this prize exultantly, and filled his bag with fragments. He was in the very act of rising from his knees, when a sudden vista opened up before him. A stone had been removed from the wall, and through the hole thus made he could see into the grounds beyond it. He peered with interest, and could see an archway with a heap of picturesque ruins over it. This was not in itself a

fascinating spectacle, and he had already satisfied a feeble momentary curiosity, when Snelling came in sight, with an aspect so stealthy and a face so pale that Tobias knelt and stared as if rooted to the spot.

The horrors of the night had been too much for the intending criminal, and Snelling had no courage to face them anew. But now, with the housekeeper being away for her marketing, and John by special leave picnicking with Will Gregg and divers others of his companions in the Quarley Woods, he had full three hours clear. He had determined to finish his deadly work that day; but lonely as he knew himself, he was in a fury of fear lest he should be discovered at it. At every step he looked to right and left with a guilty horror which filled Tobias with wonder; and there was a something so stealthy and yet so threatening in his whole motion and aspect, that the amazed watcher could make neither head nor tail of his own surmises.

The first thing Snelling did was to enter the archway, and there, drawing a newspaper from his pocket, he unfolded it and spread it like a carpet on the grass, pushing it closely against the wall and folding its edge upward there. When he had done this, he came out, stepping on tiptoe, with face and gesture so marked with guilty fear, that a child could not have misread him. He looked hither and thither, and listened with bent head. Next, he drew a small pointed implement from his pocket, and returning to the arch, began to pry at the wall. He had not worked a minute, when some fancied noise arrested him, and he came stealing out on tiptoe.

What in the name of wonder could it mean? Like a ray of light the thought came—Buried Treasure!

'I will have a finger in that pie,' said Tobias.

It was all very well for the little Jousseran to resolve valorously on facing Shorthouse with a request for his daughter's hand; it was another thing to storm the breach of British prejudice.

'I shall have to put my self-love in my pocket,' said Jousseran. 'I shall have to put my patriotism in my pocket too. If I am accepted at all, and that is not very likely, I shall be taken *faut de mieux* and with a desperate sorrow.'

He knew something, but not all, of the midland rustic's invincible ignorance of things and people outside immediate ken. He had been told in pretty plain language already that he was an outer barbarian. He knew that his neighbours for the time being regarded him as a sort of innocent, harmless savage; and though he was one of the best-humoured and sweetest-hearted fellows in the world, the self-satisfied ignorance with which the good stupid folk patronised their social and intellectual superior did really sometimes gall him. If it had stood entirely by itself, it would have been pure comedy to him; but it weighed heavily against his best hopes, and so was merely dull no longer.

On the day after his parting with Cecilia, he attired himself as if for a visit of ceremony, and with a heart alternately full of resolute courage and despair, made his way to Shorthouse's residence. Since the achievement of his portrait, Shorthouse had realised a fondness for the crim-

son plush waistcoat and the blue cloth coat with brass buttons such as he had never known before. He had begun to be awake as to their artistic value, and liked to pose in them to himself, and to sit in his own armchair with pot and pipe, looking as like his own picture as possible, and feeling fully conscious of the resemblance. It was a simple kind of vanity to assail a man of his years; but he found a great pleasure in it, and it hurt nobody. The best clothes were not to be worn lightly and without occasion, and so the treat was not one of every day; but on the morning of Jousserau's visit, Shorthouse had a call to pay, and could afford himself the treat.

Cecilia saw her lover's arrival from her own chamber window and was overwhelmed by her emotions. She dreaded to think of what would happen, and she of course admired Jousserau's courage, whilst she despaired of the effect he might produce. Her father's opinions were not easily changeable; and with regard to Jousserau's offer he was likely to be as obdurate as he had ever been about anything in his life. It may be confessed that Jousserau's task was easier than the girl's. It was he, to be sure, who had to face the dragon opposition; but meantime, as always in the best authenticated fairy stories, the maiden waited tremulous, powerless to strike a blow for her knight's life or her own freedom. In the authenticated fairy stories the knight always wins, and the damsel is always delivered; but in real life it is not so. The dragon of British prejudice was very unlikely to yield, she thought, to a French assault of arms.

The servant-girl announced Jousserau's arrival; and the farmer quitted his pose hastily and took up his position on the whitened hearthstone before the kitchen fender.

'Show the young man in, Jane,' he said gruffly; and Jousserau, standing at the door, heard feebly the unpromising tone in which he spoke. 'Well,' said Shorthouse gruffly, 'what can I do for you this morning?'

'I wish to ask,' said Jousserau, standing uncovered before him, 'if you will give me five minutes of your private time?'

'Jane,' said the farmer, addressing the girl, 'you can find something to do in the dairy, I daresay.—Take a cheer, Mr Jousseron.'

He remained standing, and Jousserau naturally followed his example.

'I should desire,' the artist began, 'in the first place to say to you what are my hopes and expectations, and what is my position in the world.'

The farmer, turning half-way round, deposited his long Brosely on the tall mantel-piece, and ramming his clenched fists into the pockets of his riding breeches, faced his companion anew with a look of dogged waiting.

'Some months ago,' pursued Jousserau, who had taken great trouble with his English, and had all night long rehearsed the scene in his mind—'some months ago I gave up a situation which brought me twelve pounds a week. I had held it for four years, and had saved sixteen hundred pounds. I have now two thousand pounds at the bank of Castle-Barfield. I can make by my work half as much every year. In time it is likely that I make more—perhaps much more. My father, who lives at Arles, in

France, is there landed proprietor, and is worth six hundred pounds in the year. He has no child but me. That, sir, is my position.'

Shorthouse's gaze had grown more and more dogged as the artist spoke, and under his uncompromising stare speech was increasingly difficult. 'Well,' said Shorthouse, 'that being so, you're pretty well to do.—But now, what's all that got to do along with me?'

'If I should marry,' said the artist, 'I should settle upon my wife my whole belongings. I am Protestant. You can inquire of my character of all who know me, and I will give you every ease to do that.'

'Yes,' said Shorthouse; 'I see where you're a-driving. Go along.'

'It is in short, sir,' Jousserau concluded, 'that I present myself as a suitor for your daughter's hand.'

'So I supposed,' said Shorthouse. 'I'll tell you what it is: you can present yourself at home, with "No" for an answer.'

The manner of the speech was as bluffly insulting as its matter, and Jousserau felt it. But it was robbed of half its sting by the fact that he had expected it, and he was too firmly set upon his purpose to allow himself to lose temper or to be beaten finally at the first assault.

'Sir,' he said, therefore, 'I shall ask you to think something of Mees Cecilia's happiness before you decide. I did meet Mees Cecilia yesterday, and she was distressed, and did not speak. I took the liberty to ask of her if it was that you had forbidden her to speak. She told me "Yes." I said then that I must try to change your mind.'

'You did, did you?' said Shorthouse. 'Well, if you'll be advised, you'll save a deal o' trouble. You might just as well get up and tell this house to walk away as ask me to change my mind about that. I'm not a man as changes his mind that easy.'

'Pardon me,' Jousserau went on, desperately but quietly, and with every outward sign of self-possession. 'Mees Cecilia has obeyed your wish. She is dutiful daughter, and will continue to obey your wish. But forgive me, sir; I know you a man of a good heart. You will not wish to make your child unhappy. If Mees Cecilia wishes that I say no more, I will not trouble her again, or you. But it seems to me just that I should ask, "Will you speak to Mees Cecilia?"'

'No,' said Shorthouse bluntly; 'I won't speak to Miss Cecilia; and I won't have you speaking to Miss Cecilia neither. You've mended up your English a bit lately, and it seems by this time as if you could understand what was said to you. Now you tek this from me, plain and straight: If ever my gell says "I will" at the marriage altar, her'll say it to a brother-Englishman. D'ye see me? D'ye understand? I've nothin' agen you, so far as I know. I don't want to put the thing no rougher than it has got to be put; but when I've got to say a thing, I like to say it. I've said what I've got to say this time, and I look to ha' done with it.'

Did ever the fatherly dragon encounter the knightly suitor with more uncompromising defiance? Cecilia listening on the stairs melted into noiseless tears, and stole back to her chamber

despairing. Jousserau stood pale and troubled, and for a little time said nothing. By-and-by, however, he drew himself together, and then he said an unwise and unguarded thing: 'We are both young, and we can wait.'

'Look here, young sir,' cried the farmer; 'you shall do none of your waiting about my doorstep. I warn thee now, mind me, if I catch thee at that it shall be the worse for thee. I'll have no maggoty fancies put i' my gell's head. You'd best go back to your own country and wait there. If I catch you sneaking about my place, you and me will quarrel.'

'Sir,' returned Jousserau, self-possessed again, 'it will take two to quarrel; and I shall not quarrel with Mees Cecilia's father.' He bowed.

The farmer turned round to take his pipe again; and the suitor went his way, naturally depressed by the result of his interview. Not a scale of the dragon's armour had been dented, but the errant knight was wounded sorely, and the imprisoned damsel wept in her turret.

'Cecilia!' her father bellowed up-stairs after a lengthy pause. 'Come down here; I've a word to say to you.'

The girl sponged her eyes with fresh water, and making what hasty pretence she could of being her natural self, ran down-stairs with reddened eyelids and new tears in her eyes.

'What's the matter with you?' Shorthouse demanded firmly.

'Nothing, father—nothing.'

'Ah!' said papa; 'I see. Thee 'st been a-listenin'. I can save myself the trouble o' talkin', then. Tell me the truth. Thee know'st what's happened?'

'Yes, father'—in the faintest frightened whisper. 'And that's what thee 'st been cryin' for?'

'No answer this time, but only a fresh outburst of tears, and a blushing face hastily covered up in a handkerchief.—'All right, my gell.' He walked a pace or two up and down the room, then struck a lucifer match and applied it to the bowl of his pipe, and so sat down puffing stolidly. 'You think it's hard, I desay; he went on philosophically. It came easy to him to be philosophical, for he was not the one who suffered. 'In a year or two, Cecilia, you'll be thankful for what I'm a-doin' for you now.'—The girl thought otherwise, but said nothing.—'What d'ye think 'ud happen to you hereafterwards if I was to let you marry a foreigner now?—Anybody, to look at you,' he continued scornfully, 'ud think as you was a-bein' ill done-by. What d'ye think I'm doin' except for your own good, ye baggage? D'ye think it matters to me who you marry? I ain't a-agin' to marry a Frenchman. It's me as is a-savin' you from all manner o' troubles and worries, and here you sit a-cryin' at me as if I was a-hurtin' you.'

Poor Cecilia thought that if she had wanted to be saved from marrying the Frenchman she might have felt differently. But she did not want to be saved from that doom. And to hear Achille spoken of as if he were something beneath the run of common men, in place o' being so infinitely above them as her lover was sure to be, was surely hard for any girl to hear. There was something romantic and fine in having a sweetheart who was a foreigner, and the sentiment was none the less real with her because she loved her lover for

better qualities than that, and had a very fair understanding of his general worth. He was an artist—a man of genius—a gentleman—infinately better than the crowd of men she knew. She would no more have dreamed of setting the one solid English pretender to her hand on the same level with Jousserau than she would have dreamed of evening a hind from her father's fields with Snelling. Mr Snelling was all very well in his way, no doubt; and if she had never seen Achille, she might even have married him, in deference to her father's wishes. But then where would have been the tender enthusiasm, the adoring worship, the timid heart-beat, the rapturous silent acknowledgment of a look or word which blessed her now, and made life a constant succession of delightful emotions? The little Jousserau was like a king among men, to her raptured fancy. And quite properly and naturally, the more he was denied to her, the more she cared for him, until the affection, which if left to itself would have flowed on tranquilly and equably, stormed along in a series of cascades as big and noisy as the young lady's nature could find room and voice for.

'I'll tell thee what it is,' said papa, who was just the man for extreme measures. 'Thee'lt never get this nonsense out o' thy head till thou'rt provided with a husband. I'm a-goin' to tek this matter in hand myself, and I shan't be long afore I make a hend of it. I picked out a man for thee months ago, and you kep' him shilly-shally-in' with I wool and I waurt, and at last give 'him a "No" without rhyme or reason.' He set his pipe on the table with so much emphasis as to shiver it in a dozen pieces, took his hat from the peg on which it hung, and walked straight out of the house, bent on heroic measures. He took the way which led to Tallymount Hall, and finding the iron gates there locked against him, began to shake at them and to roar alternately 'House!' and 'Snelling!'

TREASURES AND FORTUNES.

WE never hear in our time of a single steamer carrying the load of gold, silver, plate, and treasure that was heaped in the hold of the butter-box of the last and earlier centuries. On February 28, 1769, there arrived at Lisbon a ship-of-war named the *Mother of God*, from Rio de Janeiro, having made the voyage in one hundred and twenty days. She had on board nine millions of crusades in diamonds, and about a hundred thousand 'crowns tournois' in piastres, making in the whole twenty-nine million and fifty thousand livres tournois. So much for a single ship. In 1774, two Spanish ships from Vera Cruz and the Havana arrived with twenty-two millions of crowns, exclusive of merchandise valued roundly at twenty-seven millions of crowns. Such examples could be multiplied. Of the cargo of an English Indiaman in 1771, one item alone—a diamond in the rough—was valued at one hundred thousand pounds, 'coming to be manufactured in England on account of one of the Asiatic nabobs;' and on the private freight of this vessel the policies of insurance were opened at Lloyd's

Coffee-house at a high premium, so costly were her contents and so doubtful her safe arrival.

In those early days of extraordinary long voyages, clumsy ships, and of a navigation rendered not a little insecure by the blunders or the conjectures of the chart-makers, we should expect to meet with a great number of costly disasters, the more particularly since it was the custom to commit to a single hold the treasure that would in this day be distributed among eight or ten great and powerful steamers. Yet this sort of shipwreck is not nearly so frequently occurring in marine annals as would be supposed. When it happens, it takes an historical significance much more profound than that which attaches to loss of life. As a costly shipwreck, *La Lutine* deserves notice. She was of thirty-two guns, commanded by Captain Skynner, and went ashore on the bank of the Fly Island Passage on the night of October 9, 1799. At first she was reputed to have had six hundred thousand pounds sterling in specie on board. This was afterwards contradicted by a statement that the whole amounted to about one hundred and forty thousand pounds sterling.

In the reign of James II., some English adventurers fitted out a vessel to search for and weigh up the cargo of a rich Spanish ship which had been lost on the coast of South America. They succeeded, and brought home three hundred thousand pounds, which had been forty-four years at the bottom of the sea. Captain Phipps, who commanded, had twenty thousand pounds for his share, and the Duke of Albemarle ninety thousand pounds. A medal was struck in honour of this event in 1687. There was a very costly wreck in 1767. She was a Dutch East Indiaman, and foundered in a storm within three leagues of the Texel, taking down all hands but six, and half a million sterling.

In 1871 a Scotchman named Johnson patented a treasure-safe for ships. His proposal was that the safe should be suspended at the ship's davits, ready at an instant's notice to be lowered into the sea. He contrived that the safe should detach itself in the event of a sudden calamity, and float off, to be picked up by some passing ship, or washed ashore. The idea was ingenious: but it is not every captain who would relish the thought of an unsinkable chest full of gold and jewels hanging at his davits ready to the hand of the first daring Jack who should depend upon a black night and the navigable qualities of the chest to come safely off with a few hundreds of thousands of pounds.

There was a curious kind of smuggling practised aboard the old ships, and there is reason to believe that in many instances the actual value of the treasure in foundered vessels was never declared. An example is given of a Spanish register-ship falling into the hands of the British. Certain discoveries determined the captors not to sell her, but to break her up themselves, believing that by so doing they might find valuables artfully concealed. The duty on gold was high, and to evade it, many of the bars of that metal had been thinly coated with pewter, and denominated 'fine pewter' in the invoice, by order of the Spanish merchants. The particulars of the freight are worth giving, as illustrative of the cargoes of that age (1793), and of the great value entrusted to a single ship.

There were 694 cases of silver, each containing 3000 dollars; 33 cases of gold, besides plate and jewels of the value of £500,000; 72 hundred of redwood; 16 cases of silver in bars; 2262 quintals of bark of different weights; 2240 quintals of cocoa; 4887 cases of pepper; a great number of cases of lead, wool, sugar, medical roots, gums of cocoa, together with hides, skins, barrels of honey, and eleven cases of the various productions of Peru. 'This cargo,' says the account, 'has been two years in collecting from different parts of the coast, and is without exception the richest that ever was trusted on board of any single ship. It is impossible to form a just estimate of its value; but it is certainly not overrated when it is stated as twelve or thirteen hundred thousand pounds.' Think of the costly wreck such a vessel as this would have made; and certainly, so far as her freighters were concerned, she was as good as foundered when she was captured.

In more modern times, the costliness of shipwreck is to be found in the destruction of the fabric and her cargo rather than in the treasure on board. Whatever may have been the worth of a galleon as a ship, there need be no scruple in concluding that when brand-new her value would be but that of a toy in comparison with such ocean mail-boats as now convey specie and valuables. The sinking of an Atlantic, Indian, or Australian liner—even with a clean hold—would represent an immense treasure if told in dollars, ducats, or piastres; and when is added the cargo of such a craft along with the passengers' luggage, which would include a quantity of jewelry expressing many thousand pounds alone, some astonishing figures would be the result. As a matter of fact, our later shipwrecks do not point to the same heavy losses in specie and articles manufactured out of the precious metals as were sustained in former times. The destruction or capture of a single ship in the last and preceding centuries would frequently signify the sinking of a million to a million and a half of pounds sterling in chests of pieces-of-eight in ingots and bars and in religious decorations, and this without reference to the cargo, the value of which may be suspected when we hear of tea selling at a guinea a pound.

The *Royal Charter* is the most notable modern instance of the wreck of a 'treasure' ship. She left Australia with £350,000 in her. Of this sum, says Charles Dickens, in his chapter on this dreadful shipwreck in the *Uncommercial Traveller*, £300,000 worth were recovered at the time of the novelist's visit to the spot where she had driven ashore.

Meanwhile, how much gold and silver, minted and otherwise, is annually adrift! How many millions are yearly borne over the deep to and from India, America, Australia, China, and South Africa by English steamers alone? There should be no difficulty in making the calculation, which when arrived at, must surely yield a fine idea of the treasure over which the red flag flies, and an excellent notion of the trust that is reposed in the British shipmaster, and of the high and sterling qualities which go to the fulfillment of it.

Numerous are the instances of persons receiving extraordinary and often unexpected legacies. A railway blacksmith named Allen recently recovered an estate in Hanley worth seventy thou-

sand pounds. The Allen family had held the property from the days of the Conquest, but more than one hundred years ago the title-deeds were lost; and in 1828 the family* were dispossessed through being unable to produce them. Subsequently the deeds were found and the family estates recovered.

A few years ago, a pleasant genial old gentleman called at one of the City banks and requested an introduction to one of the junior clerks. The clerk, who had noticed the stranger, and seen him enter the manager's room, was startled by a summons to go inside. Once inside the manager's room the clerk found himself face to face with the stranger. The visitor immediately broke the ice by saying he had the pleasure to announce that by the death of an uncle, and in consequence of the death of several other relatives, this young gentleman was heir to a baronetcy. Hardly believing his ears, the clerk summoned up enough presence of mind to ask if it was an empty title. The visitor immediately and blandly informed him that his income was at least ten thousand pounds a year, with fifty thousand pounds at a bank upon current account. It has since been ascertained that the income is not less than sixteen thousand pounds a year.

The owner of a very valuable pair of trousers was lately advertised for in the French papers by the honest finder of the same, who allowed the individual to whom they belonged fifteen days in which to come forward. After this delay, he stated he would consider himself justified in profiting by this strange windfall, which, as he was in poor circumstances and about to be married, would be very serviceable to him. On the Place de la Concorde he stated that he saw one evening a dark object on the ground, which he first took to be a sleeping dog. On closer inspection, however, he discovered his mistake, and picked up the garment then in his possession. He took the trousers with him on board a boat which he owned, and on passing them in review, noticed that the buttons seemed different from ordinary ones. Prompted by curiosity, he undid the cloth that covered them, and found, instead of wooden moulds, gold pieces. Carrying his investigations further, he came across some bank-notes stitched into the waistband with other papers of value.

Stories of extraordinary windfalls are so frequently due to an effort of the imagination, that we may be excused for receiving them with a considerable amount of reserve. Elizabeth Scott was found by the police in 1875 lying on the floor of her back-kitchen. She had been dead apparently for about a week, portions of her hands having been eaten by rats. It was stated that although deceased—who was seventy-two years of age, and lived in London—was in possession of upwards of ten thousand pounds in consols, producing an income of four hundred pounds a year, she never associated with any one; and a search through the house resulted in sums of eighty-two pounds in gold and forty-seven pounds in silver being found secreted in little bags between the mattresses of the bed. For many years she had been leading a miserly existence. It was stated that she had left no will, and had only two cousins living in Scotland.

In the same year an inquest was held in refer-

ence to the body of James Swift, of Ancoates, aged seventy-four years. The deceased was a man of penurious habits; and as he was of a solitary and retiring disposition, seldom leaving his house, very little was known of him in the neighbourhood where he lived, though it was sometimes whispered that notwithstanding his apparent poverty, he was possessed of great wealth. That there was good foundation for this idea subsequently appeared. He was last seen alive at dinner-time on Tuesday prior to his death, at which time he was brushing the doorstep. Two hours afterwards, the attention of the police was called to the fact that the shutters of his house were fast closed. Not knowing what to make of this, the officer tried to gain an entrance, and was at length obliged to force open the back-door. He found the deceased lying on his back on the kitchen floor, with a chair on the top of him. He appeared to have been sitting in the chair, and to have fallen off, causing it to topple over with him. The body was cold, life being quite extinct, and the deceased's watch had stopped at half-past two o'clock. The house was in a very dirty condition, and there was evidence that its occupant had never slept in bed. In the course of examination which disclosed these things, a safe was found containing deeds and mortgage bonds representing about twelve thousand pounds-worth of property, and the large sum of two thousand pounds in gold.

A woodman named Robinson, at Hexham, Northumberland, succeeded a few years ago in establishing his claim to a quarter of a million of money.

Devonshire has been truly called the garden of England. In a small village in the heart of this beautiful country stands a labourer's cottage. It is a picturesque old place, in the midst of a large garden, such as we still find in some rural districts surrounding the humble homes of our agricultural labourers. The front of the cottage is covered with woodbine, honeysuckle, and roses, through which two little lattice windows peep out upon the passer-by, while one gable end is completely hidden by a large luxuriant grape-vine. Until quite recently, this was the abode of an old labourer and his family, who, though thrifty and industrious, were, and had been all their life, extremely poor. Life to this poor man had been a desperate struggle, and many a time the meal consisted only of vegetables from the garden which he cultivated so carefully. Hard work had been his lot all his life, and it never entered his head that the world contained for him aught beyond the scant wage due to his hard and cheerless toil. All his relations, so far as he knew, had been poor, and there was no one from whom he could expect a single penny. Happening, however, to come across a list of names of persons who had been advertised for to claim money and property in Chancery, he was greatly surprised and very much agitated to find his own name in full; and being a man of more than ordinary intelligence for his class, he at once communicated with the publishers of the list, which has resulted in establishing his claim to an enormous fortune, left nearly one hundred years before.

In 1883, Richard Scurrah, blacksmith of Well, in Yorkshire, died at the age of sixty-eight, and

was found, when his house was broken into by the police, to be dead in bed. On his premises being examined, upwards of three thousand pounds was found upon a beam in the kitchen; and mortgage deeds for several hundreds of pounds were also found in an old chest. The deceased had no relatives.

It was stated in 1882, that, according to a report from Gosport, a man named Geary, who had for the last twenty-five years been employed in a brewery there, had laid claim to an estate which had been locked up for eighty-six years, and amounted to a million and a half sterling. One of the most remarkable incidents in connection with the case was that Geary was led to become a claimant through seeing an inscription on a tombstone in a local churchyard.

The will of the 'old Lady of Stamford Street,' whose death, in a dilapidated house in that street, created some sensation when it was ascertained she had been possessed of considerable wealth, is worthy of notice. She was the owner of other property in London besides that in Stamford Street; but it appeared that other property, which for many years was allowed to run to waste, in Snow Hill, Stoke Newington, and other places, and which was also supposed to belong to her, did not do so. She died worth about one hundred thousand pounds in the funds, had many freehold and leasehold houses; and there was quite an *olla podrida* of curiosities found in her house when search was made for some other will. Amongst other things there was a room full of caps and bonnets, some of the latter nearly half a yard long (pokes of a former generation); and in a canvas bag was found five hundred pounds in sixpenny, fourpenny, and threepenny pieces. She had quarrelled many years ago with all her relations, and her will was as follows: 'I, CORDELIA ANGELINA READ, of Stamford Street, in the County of Surrey, Spinster, do hereby give and bequeath to the Treasurer for the time being of the Hospital for the Cure of Consumption at Brompton, in the County of Middlesex, for the use of the said Institution, all my household furniture, pictures, goods, chattels, trinkets, jewelry, and effects, which may be in my dwelling-house in which I may reside at the time of my decease, and also my ready money at the banker's, and money in the public securities or funds in Great Britain, and also all other of my personal estate and effects which I leave or bequeath to such an Institution.' By this will, one hundred thousand pounds went to the Brompton Hospital.

An Irishman named Moore, a native of Cavan, died at Ramalto, in Buenos Ayres, where, after a residence of forty years, he amassed the large fortune of four hundred and fifty thousand pounds sterling. By his will, two half-brothers living in his native parish of Cavan were raised from a position of poverty to one of wealth.

A young labourer of Montelimart was recently visited by a singular stroke of good fortune, which had the immediate effect of depriving him of speech. An uncle from whom he expected nothing left him one million eight hundred thousand francs. At first, another will was found, leaving the bulk of the property between two brothers of the deceased, who, on hearing the news, proceeded to embrace each other; but

their happiness quickly evaporated when a testament of more recent date came to light by which the nephew was entitled to the whole fortune.

FOILED BY HIMSELF.

IN TWO CHAPTERS.—CHAP. I.

'Who is this letter from, Jenkins?'

'I don't know, sir. The man who brought it is waiting in the front office for an answer. He looks like a working-man dressed up in his Sunday clothes.'

Mr John Barnett, solicitor, cut open the envelope carefully, as was his habit, took out the enclosure, and read:

MOREDUN HOUSE,
ELDERGATE, Friday, 6 A.M.

DEAR SIR—I am in great trouble. Mr Monkton was found dead in the library last night about nine o'clock. The cause of death was heart disease. Could you come down here to-day and remain till after the funeral, and advise me with regard to the funeral arrangements and other things? It is a great deal to ask, I know; but you see I have no right to interfere in these matters, as I am no relative of Mr Monkton's, and I do not know what to do. You were always his chief friend as well as his legal adviser. I am afraid of his brother coming here when he hears of the death. I enclose notices which I will thank you to get inserted in the various newspapers.—I send this letter by our gardener, who will bring back your reply.—Yours truly,

KATHERINE ASHLEY.

Mr Barnett appeared very much affected on reading this letter. 'Mr Monkton is dead, Jenkins,' he said. 'Found dead in his library last night. How very sudden! He was here only two days ago, looking as well as ever I saw him.—This letter is from Miss Ashley. She wishes me to go to Eldergate to-day; but Mr Morgan is coming here in a short time, and I have to go out with him relative to some business which will detain me, I expect, till late in the afternoon. I will not be able to get to Eldergate till the six o'clock train.—I have nothing particularly pressing for the next few days, have I?'

'No, sir; I don't think so.'

'Then I will be able to wait over at Eldergate till after the funeral, as Miss Ashley wishes. I will give you a note for the man. I don't know when I got such a shock.'

The note despatched, Mr Barnett sat down to think over matters. Mr Monkton and he had been friends of many years' duration, and having been often at Moredun House, Mr Barnett was well acquainted with Miss Ashley, who was orphan niece of his friend's late wife. Mr Monkton had no family of his own, and Miss Ashley had lived at Moredun House for the past ten years. Her aunt, Mrs Monkton, had died a few years before. By the terms of Mr Monkton's will, which Mr Barnett himself had drawn, the latter knew that he, along with Sir Andrew Dawson, a wealthy neighbour of Mr Monkton's, was appointed an executor, and a joint guardian of Miss Ashley until she should attain the age of

twenty-one. This she would not reach for nearly three years yet; and in the interval, some arrangement must be come to with reference to her.

'I hope that brother of Monkton's doesn't come upon the scene, for he is a thorough scoundrel, if ever there was one,' he said to himself. 'He will give us some trouble, if he can. However, he need not try to dispute the will; although I believe he would do it in a minute, if he thought he had the ghost of a chance.'

Here Mr Barnett's meditations were interrupted by the entrance of his client Mr Morgan, who had come to keep his appointment; and in a short time both left the office together. It was after five in the afternoon when Mr Barnett returned.

'Confound Morgan!' he said to Jenkins, who was his head-clerk, and who had waited behind the others, in case of anything being required. 'I could not get away earlier. It will be after ten before I get to Mr Monkton's house, for I will have to wait till the eight o'clock train now. I must go home first. I shall not be back at the office till Wednesday; but if there should be anything particularly pressing, I might take a run up.—You can let me know how things go on, Jenkins.'

'All right, sir,' answered Jenkins; and then Mr Barnett departed.

He left Euston Station at eight o'clock en route for Eldergate, which was distant from the Metropolis about two hours' journey by rail. Mr Monkton's carriage was in waiting at the station, and he was soon being driven up the avenue to the house.

A footman, who appeared to be the only one awake in the house, opened the door to him. But as he entered, an old lady, whom Mr Barnett recognised as a distant cousin of Mr Monkton's, met him in the hall. She was a sturdy old Scotchwoman, hale and hearty, though upwards of sixty years of age.

'Ye're very late. I was thinking ye mightna be here the night now; and I advised Miss Ashley to gang awa' to her bed, and I would look after ye if ye came. Ye'll be ready for some supper, I'm thinking.—Come this way into the dining-room.'

Mr Barnett followed the loquacious old lady into the room, where supper was immediately brought in. 'I am surprised to see you, Mrs Crawford,' he said. 'I did not know you were here. Miss Ashley did not mention you in her letter this morning.'

'Because she didna ken I was coming. I'm staying in London wi' my son Peter now, and I came down here this morning on a visit by chance. I found everything at sixes and sevens, and that pair lassie greeting like to break her heart; so I just stayed on till ye would come.'

'You were quite right. I would have been here earlier, as I told Miss Ashley in my letter, but I was detained.—But I need not keep you out of your bed, Mrs Crawford; I can attend to myself. I know the way to my room.—I have been often here before, you know.'

'Oh, I'm in no hurry,' said Mrs Crawford. She had dismissed the servant, and had herself waited to attend to Mr Barnett's wants. He had scarcely begun to do justice to the supper, however, when

she suddenly bent forward and whispered almost into his ear: 'He's here.'

'Who is here? Whom do you mean?' asked the solicitor, almost dropping his knife and fork in his surprise.

'Who should I mean but Henry Monkton, of course? Came here in the middle o' the afternoon, and intends waiting till after the funeral, he says. But he may spare himself the trouble, for onything he'll get, I hope.'

'But how did he come to hear of his brother's death so speedily? It will not be in the newspapers till to-morrow.—Miss Ashley surely did not send him notice?'

'No; she didna. She's ower frichted for him to do the like o' that. She's keepit her room ever since he came, or else she would hae been waiting here to see ye. But ye'll see her in the morning right enough. He met Blake the gardener by accident at the London station this forenoon, and got the news frae him. He has a gude stock o' impudence to come here at the present time, when he kens brawly he daurna hae showed his nose had his brother been living.—Dear, dear! sic a change as his death will mak in this house!—What's to become o' that lassie? Surely he would mind her in his will.'

'Was he supposed to have been long dead before he was found? Who was the first to discover him? Was it Miss Ashley?'

'Ay; she was the first. He had gane into the library at seven; and Miss Ashley, who had been out at her tea at Sir Andrew Dawson's, came home about nine o'clock. When she went into the room, he was sitting dead at his desk.'

'What had he been doing? Reading, or what?'

'He had apparently been looking ower some papers and letters, for there were a lot lying about the desk. The doctor believes he hadna lang been dead when he was discovered.'

'Well, well. I must see after things in the morning. It is a little awkward Henry Monkton being here.—Who has charge of the keys of Mr Monkton's private drawers? Miss Ashley, I presume?'

'I hae got them just now. She wasna fit to look after anything. I locked up some o' the drawers mysel' since I came.'

'And the papers that were on Mr Monkton's desk, what was done with them?'

'They're just lying as he left them. I was feared to touch them, and I let them lie till ye would see them yersel'. I suppose it will be ower late the night now. Ye can put them in the safe, if ye like, for I hae the keys here.'

'If you light the gas in the library, I will have a look at them before I go to bed. They will be better looked up, at anyrate, if there are any deeds amongst them.'

Preceded by Mrs Crawford, Mr Barnett made his way to the library. This had been his dead friend's favourite room, where he spent most of his time. The top of the desk was strewn with letters and documents of various kinds, among which Mr Barnett discerned a small bundle of titles, part of those connected with the purchase of Moredun House. He got a newspaper, and bundled all the papers together.

'We will put them in the safe till to-morrow, when I will look them over,' said he. 'His will

must be in the safe or in one of the drawers of this old cabinet.'

'Dear me, I thocht ye would have had his will,' said Mrs Crawford. 'When I made my will, though gudeness kens I hadna much to leave, my lawyer, Mr Simpson, tell'd me that it was usual for lawyers to keep their clients' wills.'

'So it is; but Mr Monkton liked to keep his own, and his titles and other documents also. But the will won't be difficult to find, for I have an idea where he kept it. I will go off to bed now. I shall see Miss Ashley in the morning, and Mr Henry Monkton too, I suppose. He has not been interfering in the house in any way since he came, has he?'

'No; he has keepit himself very quiet. He said ye would look after things when ye came. He didna want to meddle wi' onything.'

'I am glad to hear he is so peaceably inclined. You know the reason of his last quarrel with his brother, I daresay?'

'Deed do I. I ken that Henry Monkton has been a ne'er-do-weel a' his days, and that his brother was aye far ower gude to him. He paid his debts ower and ower again; and to think that after a', he would try to rob his brother o' his ain money behind his back.—I reckon Mr Monkton caught him in the very act o' helping himself to his money out o' the safe.'

'Yes; and after that he ordered him out of his house, which he should have done long before. But, as you say, he was far too good to him. They have never spoken since. Were you in the house when Henry Monkton arrived? He did not come till the afternoon, I think you said?'

'No; I was out when he came.'

'How is he looking? Does he seem sorry at hearing of his brother's death?'

'He was looking kind o' strange like, I thocht, and seemed kind o' startled when I came into the room where he was. I don't think he had heard me coming till I opened the door. He was civil enough, though I dinna ken when I saw him behave sae weel. But of course he could scarcely act ony other way and his brother lying a corpse i' the house.'

'Where is the body? In Mr Monkton's own room?'

'Yes. Miss Ashley's is next to it. The house-keeper is sleeping wi' her, in case she should feel eerie. Young people are aye feared for death, ye ken. Yer room is a' ready for ye, Mr Barnett.'

'Thank you. I know my way, Mrs Crawford,' he said, taking the bedroom candle from her hand as they stood together in the hall. 'Good-night. I am sorry to have kept you up so late on my account.'

He went slowly up the stairs and along the corridor towards the room he was wont to occupy on the occasions of his visits to Moredun House. As he passed the door of the room where lay the dead body of his friend, so lately instinct with life, a feeling of awe crept over him. A stillness as of the grave seemed to hover in the air. What a strange thing was this which men call death!

Next morning, when the solicitor came downstairs, he found Miss Ashley in the breakfast-room.

She was a slight fair-haired girl with a very pretty face. She wore a dark-blue morning gown. Her eyes looked heavy and bore the traces of recent tears. She greeted Mr Barnett with outstretched hand. 'Oh, it is such a relief to have you here!' she said. 'I did not know what to do; and Mrs Crawford was not here when I wrote you. She would tell you that Henry Monkton came yesterday afternoon?'

'Yes. I expected to see him at breakfast. Is he not going to appear?'

'I do not know. He was up early, and has gone out somewhere, the housekeeper says. But we will not wait for him. Mrs Crawford is having breakfast in her own room.'

'I expected Henry Monkton would have been trying to act the master here,' said Mr Barnett; 'but Mrs Crawford informs me he has shown no disposition to do so—that he has left everything for me to arrange.'

'She told me so too. He seems to have altered for the better. We could scarcely blame him even if he did assume the mastership in the house; he is Mr Monkton's only near relation.'

'Yes; but how did he behave towards him? Not as a brother should, certainly. Had I been in Monkton's place, I would never have borne with him so long.'

'Uncle was very patient with him. I believe he always looked on him as a mere boy, who would grow wiser in time. And he was only eight years younger than uncle, after all. He must be somewhere about forty-six.'

Mr Barnett ate his breakfast in comparative silence. He was debating within himself as to the advisability of imparting to Miss Ashley the terms of Mr Monkton's will at present, or of leaving it till later. She had said nothing on the subject; and, judging by appearances, the thought of the will or of how she herself might be concerned in it did not seem to be troubling her. Had she shown any signs of anxiety with regard to what she should do, or where she should go after the funeral, Mr Barnett would have felt it his duty to tell her she was amply provided for; but as it was, he thought it better she should remain in ignorance in the meantime.

After breakfast, Miss Ashley went up-stairs. Left alone, Mr Barnett decided that he would wait until he had seen Henry Monkton, before beginning his work in the library, and went out into the garden to smoke. He was in the full enjoyment of his cigar when a step coming down the garden path caused him to turn round. The comer was Mr Henry Monkton, who held out his hand with apparent friendliness. He was a tall sallow-complexioned man, not bad-looking, with a restless look in his black eyes. He had a moustache, but no beard. Saving in his complexion and his restless looks, he had a great resemblance to his dead brother.

The solicitor took the offered hand, and bade him good-morning in as friendly a tone as he could muster.

'I have to apologise for not appearing at breakfast,' said Mr Monkton. 'I had a headache, and went out to walk it off. I am going in now.—I believe you came last night?'

'Yes. You were in bed, I think. I saw no one save Mrs Crawford.'

'She would keep you in talk at anyrate. How her tongue does go! I never can make out half she says. Confound these poor relations, always cropping up!—Have you seen, Miss Ashley this morning? She was not very well yesterday.'

'I saw her at breakfast. She has gone to her room now.—You would be sorry to hear of your brother's death?'

'I have good reason to be sorry. A better brother man never had. I am afraid I was a sore trouble to him. I am glad, however, that our last quarrel was made up before he died; I should never have forgiven myself otherwise.'

'Then you have seen him lately?' asked Mr Barnett in surprise, which he did not attempt to hide.

'I saw him in the city on Tuesday, and spoke to him. He had been at your office. He was rather stern at first; but he had always a warm side to me, bad as I was.'

Mr Barnett doubted Mr Monkton's statement very much, but did not tell him so. He only remarked: 'It must be a great comfort to you now as things have happened.'

'Yes; it is a comfort, as you say.—Will you be good enough to have a look through my brother's papers and arrange them if they need arranging? You understand such things. He would have liked you to do it, I know.' He spoke as though conscious that by his own wicked conduct in the past he had forfeited all right to interfere in his brother's affairs.

Mr Barnett, although wondering not a little at the position Henry Monkton was taking up, wisely refrained from making any remark. He merely said: 'I was just waiting to see you before I began.—I will go in now;' and left Mr Monkton standing alone.

Before he could begin his work amongst the documents, the arrangements for the funeral required to be seen to, and the afternoon was pretty far advanced also when he at length set himself down to work in earnest. He first of all opened the safe, took out the papers which he had wrapped up in the newspaper the previous night, and placed them on the desk in the middle of the floor.

'I had better find the will in the first place,' thought he. 'I can't understand Henry Monkton's behaviour at all, so different from his usual style. One would think that he already has an idea how the will stands, or he would be acting differently. He must have come down here simply in a fit of bravado, and with the intention, perhaps, of deceiving the people around by a pretence of regret for the brother he has lost. He can't cheat me, however, with his hypocritical talk. I wonder if he knew that the will was in his brother's possession, or if he thought I had it?—Here is a bundle of titles; the will may be amongst them. I have seen Monkton take it out from one of these drawers before, I think. This one is half empty. Some of these papers on the desk probably have been kept in it.'

He sat down and unloosed the piece of pink tape with which the documents were tied together and scrutinised each carefully. 'It is not amongst these at anyrate,' he said, 'laying them aside and taking out another smaller bundle. 'Nor here either,' he added, after glancing over this

second lot. 'After all, it may be in that old cabinet or in this desk; but I should think he would not keep anything but letters or things of that kind in either of these two places.'

He happened to turn round after closing the drawer, and the bundle lying on the desk attracted his attention. He unwound the newspaper which enveloped its contents and scattered the papers loosely over the desk. A slight scrutiny convinced him that they consisted chiefly of letters and circulars of one kind and another, some of them dated many years back. These he paid little attention to. Then came part of the Moreund House titles, which, together with some leases, formed the remainder of the documents before him. He looked these over and then placed them in the drawer he had already examined. The rest of the safe was mainly taken up with business books used by Mr Monkton before his retirement from business as a merchant. The safe was not a large one, yet it took Mr Barnett some time to examine thoroughly all it contained. He had just made up his mind that the document sought for was not there, when he was summoned to dinner.

Mrs Crawford, Miss Ashley, and Mr Monkton were all present, but none of them had dressed for the occasion. The meal passed very quietly, little conversation being indulged in. Even the usually garrulous Mrs Crawford was silent. When the ladies left the dining-room, Mr Barnett retired with them, and at once went back to the library to resume his search.

He had anticipated no difficulty in finding his late friend's will; but the looking for it promised to be a more tedious business than he had expected, although he had no doubt of finding it ultimately. Hours passed, and still the search went on unsuccessfully. By ten o'clock both cabinet and desk had been thoroughly overhauled, unless there were some secret drawers which he had failed to discover. There was no other place left in the room where Mr Monkton would be likely to keep the will, that he could see. Could it by any chance be in his room up-stairs? If it was not discovered there, the conclusion seemed inevitable—that the will was lost.

NATURE BY NIGHT.

To all inhabitants of great cities, and to many dwellers even in the rural districts, the night sights and sounds by river, wood, and field are quite unknown. For, of course, during the hours when the wild things so hidden by day are at large, and the birds whose notes are not distinguished in the full chorus of the day are at their sweetest, the majority of people are asleep, or at anyrate in bed. Yet the summer nights, brief as they are, are full of life when the darkness is most complete, with a fullness which is vivid in our memory of many of the 'small-hours' passed in meadow or by lonely wood under the starlit sky. And first of all to be mentioned is the amount of bird-music to be heard at night by those who are present to hear it. Nor need one go afield for all—though some of the rarest will only be found in the solitudes—for some of the songsters in the still night pour forth their

music in the garden—that one compensation, however dull or commonplace the locality, to all who really ‘live in the country.’

The nightingale, as every one knows, is a night-singer, whose exquisite gush of melody in the ‘ivory moonlight,’ while the air is fragrant with the dewy flowers, is subtly soft enough to touch the dullest hearts with some echoes of romance. But with Philomel, as the eighteenth-century poets loved to call the musician, most people’s knowledge of night-singing birds begins and ends, unless they be of the few who, in the silent summer-night, have wooed Nature instead of sleep. And to those who have, what a different experience!

Beginning nearest home, in the quiet garden, the shrill yet soft and vivacious trilling of the whitethroat meets the ear—a bird not very generally known, but a haunter of the same spot year after year, loving well an evergreen on a lawn as a home, at whose base its well-feathered nest is built. It is a bird of lively song, contrasting in the moonlight with the most musical, most melancholy fluting of the nightingale.

Step forth from the garden, and traverse the more remote ground by sequestered coppice or double hedgerow, where ancient trees entwine, and the rich music of that shy songster the woodlark, which is as little popularly known as its relative the skylark is, generally floats out on the night. Cross the meadows, over which echoes in every direction the harsh cry of the landrail, towards the winding river, rippling through its rushy margin on either side, and shining like silver in the moonlight. Pause, and you will hear the humble but pretty lay of the reed-sparrow, seldom recognised by day; and what is far rarer, and can indeed be said to have been heard but by few, the merry carol of the water-ousel, that snowy-breasted little bird, which has such quaint ways, poising motionless in the day on some rock or stone, and then darting under water, where, on the shallow gravel, for a brief moment it can be seen running. It is a charming songster in its way. To our own thinking, heard on a summer night by some tranquil river-bank, it seems to bring to the mind a picture of Arcadia, when all the world was young. Few people, however, speaking comparatively, have heard the water-ousel’s song.

Here, however, is a fair variety of night-music from the feathered choir to match the summer prime—nightingale, woodlark, reed-sparrow, water-ousel, whitethroat, and we may add, sometimes the skylark, whose exquisite cadences mounting higher and higher under the flood of moonlight make the listener recognise more than ever the appropriateness of Shelley’s lines:

Hail to thee, bright spirit!
Bird thou never wert.

Poets who are not observers usually write, and some novelists too, as if the sounds of night in our British Isles were confined to the lay of the nightingale and the foot of the moping owl; but when to the list we have given we add the crow of the pheasant—on a moonlight night often the poacher’s guide—the slumberous coo of the stockdove, the varied notes of the waterfowl, and

the occasional whirring note of the night-jar—from which sound this provincial name is derived—it is evident that the poets and novelists are wrong; perhaps, as Fielding says of the would-be painters of society in his day, because they know nothing about it. Thus much of the birds.

He who wanders in a summer night ere dawn has shown its earliest sign by ‘meadow, grove, and stream,’ will see strange things, not to be seen, save by rarest chance, in the hours of day. This is the time when the otter—little known of *free nature*, yet far more plentiful than supposed; indeed, one high authority says hardly a stream exists now without its otter, albeit he be rarely seen—makes his journey for foraging purposes. Far and away from his ‘holt’ upstream, comes the swift, shadowy, stealthy amphibious creature, nearly always going down-stream, yet leaving that strong scent behind wherever he touches shore, which the hounds, hours afterwards, discover. He makes his journey, feeds, and retires again always before dawn. At certain points he leaves the stream, and traversing the bank, re-enters it farther on, and usually shows a curious preference—just as the hare will in the ‘runs’ in a hedge—for the same precise spots of exit and re-entrance. Here and there he may leave a fine fish with his pet piece bitten out of the shoulder—the ‘otter’s mark.’ Sometimes, but not often, he leaves the water and proceeds a considerable distance by land, far from his usual stream.

Much rarer, but still, especially in the wilder and more solitary parts, to be met with is the badger, a fine young specimen of which was found among the timber-loads deposited some time ago on a timber wharf by the canal at the City Road, London. The badger burrows in the most lonely and isolated recesses of woods and hills; and those who have explored one of the burrows can say what a fine specimen of engineering and sanitation this cleanly and culminated beast (or ‘dirty as a badger’ is simply another exemplification of popular fallacies—presents to his superior, man. The badger is very little seen, being perhaps the most retiring and conservative of British beasts, pursuing the even tenor of his way much as when Cæsar landed in Kent. But it is of his appearance as one of the night-wanderers we would speak. If you are lucky enough to be in his locality in the small-hours, you may see a grayish creature curiously like a little bear waddling and grunting in the moonlight, very uneasy if to your leeward, as its scent is keen. It goes long distances at night, when humanity and most of the animal population with which man is familiar are, as Carlyle puts it, ‘lying in horizontal swathes.’ Eggs, snails, worms, roots—these are part of its fare; and through the night-hours it pursues its quests, though infinitesimally few are the people, in comparison with the millions in these islands, who have ever seen it. He is altogether in his habits a nighthawk, a minion of the moon, nor loves the daylight, preferring the safety of his secluded burrow during that time.

Of the fox as a night-traveller it were trite to speak; everybody, and especially in the case of fowl-keepers or farmyards, knows about him. Weasels are fond of gliding across roads and along ditches, too, during the witching-time, and, like

its tame town relative, the cat, that has taken to field-life, poaching, and evil ways generally, is always a most prominent feature in Nature by Night.

A STRANGE COMPACT.

It was a dreary night in the winter of 17—. Outside, a heavy fog filled the narrow unsavoury streets of the Metropolis, and the lungs and eyes of such unfortunates as chanced to be abroad. It even invaded the small wooden sanctuaries of the night-watchmen, interfering with slumbers to which the inmates were both by age and office entitled. Across the river, in the dingy ill-paved lanes of the Borough, the fog seemed at its worst, a light warmish haze being the only indication of the presence of those shops which still remained open, and round which small ill-clad urchins with the most unmistakable intentions persistently hovered.

'A sweet night for footpads,' muttered young Dr Mostyn, as he disengaged himself from a chance rencontre with a post, and felt his way along by tapping with his stout stick at the house-walls, a proceeding by which he had already severely damaged the legs of three of his suffering fellow-creatures, and poked a large hole in the kitchen window of a fourth. 'And now,' he continued, talking to himself for the sake of company, 'for home and supper and a fire.—Ah, and a patient or two, perhaps. Who knows?'

At this cheering prospect his spirits rose, and he banged mightily at the wall with his stick in consequence, until at length, coming to a small street on his right, he turned smartly down, and having made sure of his own door, knocked briskly at it.

'Who's there?' cried a shrill female voice in response.

'It's I, Bet,' said her master. 'Open the door, my good girl.'

'Not if I knows it,' was the cheering reply. 'You take yourself off, young man, whoever you are. There's two bulldogs and three men with loaded guns standing by me, to say nothing.'—

'Open the door, Bet!' roared her master through the keyhole. 'Don't you know me?'

'Is it nine o'clock, or is it eleven?' propounded the damsel; 'because, if it's eleven o'clock, my eyes deceive me; and if it's nine o'clock, your voice deceives me; for the doctor said he'd be home at eleven and not before; and considering the fog, I should say a good deal arter.'

'Open the door,' said the surgeon sharply. 'I'm back already because my patient's dead. Come; open at once!'

There was a creaking and shooting of bolts as he finished speaking; and the door being cautiously opened, discovered an angular woman of some five-and-thirty years, whose nervous face cleared directly she saw her master.

'I'm asking your pardon for keeping you so long, sir,' said she; 'but one never knows who's who; and judging by the noises and runnings,

there's been rare doings round the corner to-night.'

'Anybody been, Bet?' asked the surgeon, as, ten minutes later, he sat down to a carefully grilled chop.

'Not a soul,' replied his handmaiden.

'And a nice person you would be to open the door, if an accident *had* arrived.'

'Oh, I should have opened it at once,' said Bet with decision. 'Directly they used the word "accident," I should have opened it and chanced it.'

Her master, smiling at her devotion, drew his chair to the fire, and having carefully filled a long clay pipe, fell to smoking with an air of great enjoyment and content. Then, thinking it extremely unlikely that he would be disturbed at that late hour, he dismissed his retainer to her quarters in a neighbouring house, and being left to himself, lapsed into a brown-study.

It might have been the fog, or it might have been the unexpected death of his patient; whatever the cause, his thoughts took a very gloomy direction indeed, and he shook his head despondingly as he thought of his future prospects. His mood was not made more cheerful by the room, which was large and dark, and panelled with oak, and ornamented with battered oil-portraits of dead and gone worthies, with whom he claimed some kinship more or less remote, who seemed to stare at him to-night in a particularly ghastly not to say wooden manner. Besides all this, he *was* in love; and he had no sooner built a magnificent castle—in the air—and placed *her* in it, than an anything but airy landlord called for the rent, and the dream was spoiled.

He had been sitting thus for some time, nursing his woes and sipping a glass of hot cognac which he had prepared, when he was disturbed by a loud imperative knocking at the front door; whereat he snatched up one of the guttering candles and marched down the narrow stairs to open it. The feeble light of the candle, when he had done so, showed him a tall, strongly built man of middle age, whose naturally fine proportions were increased by the fog, which clung to them and exaggerated them. The surgeon noted that he was richly clad, and also that the embossed hilt of a sword protruded from the skirts of his coat, while his face, from some powerful emotion, was pale and drawn.

'Are you the surgeon?' asked the new-comer abruptly.

'At your service,' was the reply.—'Come in.'

The stranger obeyed, and waiting until the surgeon had secured the door, followed him upstairs.

'Examine me!' said he, taking off his laced coat and standing pale and upright before him.

'Unfasten your shirt,' said the other, falling in with his strange humour and commencing a careful examination.

'Well?' inquired the stranger when he had finished.

'Sound as a bell and as hard as oak.'

'Not likely to die suddenly?' suggested his visitor.

'No. I should think that that would be the last thing to happen to you,' replied the puzzled surgeon.—'Why, what is the matter with you? Do you feel ill?'

'No; I feel hale and strong, capable of enjoying life with the best. I've never had an illness in my life. But for all that, I shall die at midnight.'

'Of course,' said the surgeon, somewhat provoked at all this mystery, 'if you are going to kill yourself, you can speak with more authority as to the time than anybody else.'

'I have no intention of committing suicide,' was the stern rejoinder. 'Nevertheless, at midnight my time expires. The manner of my death is unknown to me; but I shall never see the lifting of this dreadful blackness, which on my last night upon earth has fitly interposed itself between me and the heaven I have renounced.'

The surgeon, listening to this strange outburst, turned to the table, and filling a glass with brandy, handed it to his extraordinary patient. 'Twill put heart into you,' said he.

'But not a soul,' said the other; and shuddering convulsively, drank it at a draught; then placing the glass upon the table, he drew a purse from his pocket and looked at the surgeon. 'Your fee?'

'Nothing. I know not what your trouble is; but I wish much that I could help you.'

'I'm past all help,' said the other sadly, moving towards the door; then pausing, as the surgeon took up one of the candles to light him down, he said in irresolute tones: 'As you shall judge, if you care to hear?'

'By all means,' said Mostyn heartily, as, replacing the candle, he poked the fire and drew up a chair for his visitor.

'Twenty years ago,' said the latter, accepting the proffered seat and leaning towards the surgeon, 'my circumstances were very different from what they are now. Young and strong, I had at the death of my parents rejected the bread of dependence offered me by relatives, and full of hope, had come to London to make my fortune. It proved to be harder work than I had anticipated; and in a very short while I was reduced to the verge of starvation. One dreadful night, of which this is the twentieth anniversary, I was half-crazed with poverty and despair. For two days I had not tasted food, nor did I see the slightest prospect of obtaining any. Added to this, I was deeply in love, though unhappily the interference of those who should have been our best friends kept us apart. As I crouched shivering in the garret which served me for a lodging, I think I must have gone a little bit mad.' He broke off suddenly, as though unwilling to continue, and stared gloomily at the fire.

'Well?' said the surgeon, who had been listening with much interest.

'Have you ever heard of compacts with the Evil One?' demanded the stranger.

'I have heard of such things,' replied the surgeon, on whose spirits the occasion and the visitor were beginning to tell.

'I made one,' said the other hoarsely. 'Crouched by the empty grate, which mocked me with its cold bars and white ashes, my thoughts turned, as though directed by some unseen power, to all that I had heard and read of such compacts. As my mind dwelt upon it, the subject lost much of its horror, until a gentle rustling in the neighbourhood of the fire drove me with quaking heart to my feet. My fears, however, were but

momentary, and with fierce determination I called upon my unseen visitor to lend me his awful aid. As I spoke, the sounds suddenly ceased, and a voice seemed to cry in my ear: "Write, write!" I dragged a small table into the moonlight, which struggled through the begrimed panes of the window, and with my own blood and the miserable stump of a pen, wrote out the terms of an agreement with the Prince of Darkness, possessed, as I did so, with the horrible consciousness of something in the room watching me. I vowed that if for twenty years he gave me wealth and the possession of her whom I loved better than my own life, my soul should be the forfeit. If the next morning brought change of fortune, I should take it for a sign that he had accepted my conditions. I signed it, and swooned.—When I awoke from the sleep into which the stupor had merged, the sun was shining brightly into my foul lodging, and below was a messenger who brought me news of a large fortune which had fallen to me through the death of an uncle. God forbid that my rash vow should have had ought to do with it! Since then, everything has prospered with me. I married the woman I loved. We have a large family. I have kept my secret to myself. To-night at twelve, my time expires.'

'The change in your fortunes was a mere coincidence,' said the surgeon uneasily.

'Another coincidence for you, then,' said his visitor, whose face was now livid. 'In the morning, when I awoke, the agreement which I had left on the table had disappeared.'

Mostyn rose and, taking great care not to extinguish the flames, snuffed the candles.

'As I supposed my death would be a strictly natural one,' continued the stranger, 'I thought I would consult a surgeon, in order to see whether my heart was sound, or whether I was to die as I have said, in a perfectly natural manner owing to its disease. A watchman whom I met directed me to your door.'

'Do you live in the neighbourhood?'

'No—at Westminster,' was the reply. 'But having put all my affairs in order, and wishing that my dear ones should be no witnesses of my death, I have been roaming about the streets to meet it there.'

'Alone?' queried the wondering surgeon.

'I—hope so,' said the other, shuddering.

'Be guided by me,' said the surgeon earnestly. 'Return to your home, and forget all about this mysterious compact you fancy you have made.'

His companion shook his head and turned to the door.

'Are you going to roam about in the fog again?' asked Mostyn.

'Unless you will let me stay here,' said the other, glancing at him wistfully. 'You are not nervous?—you do not think I shall die?'

'You will die of fright if you die at all,' said the surgeon sturdily. 'But stay, and welcome, if you will.' And to avoid the thanks of his guest, he poked the fire until the resulting blaze almost caused the candles to snuff themselves out with envy.

For some time they sat silent. The streets were now entirely deserted, and no sound save the flickering of the fire disturbed the silence of the room. Then the surgeon arose and, upon

hospitable thoughts intent, busied himself with the little spirit-case which stood on the sideboard; and after sundry most musical gurglings from the bottle as it confided its contents to the glasses, appeared in his place again with two steaming potatoes and a sugar-bowl. 'Cognac,' said he, 'with all its fiery nature subdued, now in its tranquil old age.'

'Thanks,' said his visitor, taking the proffered glass. 'The last toast I shall drink: Long life to you.' He tossed off the contents, and again lapsed into silence, while the surgeon slowly smoked his long pipe, removing it at intervals in favour of the spirit he had so highly commended.

Half an hour passed, and a neighbouring church clock slowly boomed the hour of eleven. One hour more. The surgeon glancing at his companion to see what effect the sound had upon him, saw that his eyes were closed and that he breathed heavily. Rising cautiously to his feet, he felt the pulse of the strong sinewy wrist which hung over the side of the chair, and then, returning to his seat, sat closely regarding him, not without casting certain uneasy glances into the dark corners of the room. His pipe went out; the fire burnt low, and, seen through the haze of fog and smoke, the motionless figure in the chair seemed suddenly to loom large in front of him and then to be almost obscured by darkness.

For a few seconds it seemed his eyes closed. When he opened them the fire was out, and the figure in front of him still sat in the chair, though its head had now fallen on its breast. Full of a horrible fear, he glanced hurriedly at the clock and saw that it was just upon the stroke of four, then he sprang to the side of his guest and seized the wrist nearest to him. As he did so, he started back with a wild cry of horror, for some slippery thing, darting swiftly between his feet, vanished in the gloom of a neighbouring corner.

Ere he could recover himself, the man in front of him stirred uneasily, and rising unsteadily to his feet, gazed stupidly at him. 'What's the matter?' he asked at length in dazed tones.

'Matter!' shouted the still trembling surgeon. 'Why, it's four hours past midnight, and you are alive and well.'

With a violent start, as he remembered his position, the stranger glanced at the mantel-shelf. 'Four o'clock!' said he—'four o'clock! Thank God, there was no compact!'—Then another fear possessed him: 'Is it—is the clock right?'

'To the minute,' said the surgeon, standing gravely by with averted head, as his visitor, heedless of his presence, fell upon his knees and buried his face in his hands.

As he rose to his feet, the old church clock slowly struck the hour of four, appearing to both the listeners to do so with an emphasis as unusual as it was welcome. As the last stroke sounded, the stranger who could even now hardly realise his position, threw up the window and extended his head. The fog had disappeared, the air was crisp and clear, and the distant rumbling of the early market-carts betokened the beginning of another day.

'How came I to sleep?' he inquired, closing the window and turning to the surgeon.

'I drugged your drink. It was the only thing

I could do. You were in such a strange state of alarm that you would either have died or gone mad if I had not done so.'

The stranger extended his hand and caught the young surgeon's in a mighty grasp. 'You ran a fearful risk! Suppose that I had died. My death would have been attributed to the drug, and you would have been accused of my murder.'

'I chanced it,' said Mostyn simply. 'There was no time for consideration.'

'It has been a strange business,' said the other. 'What could it have been that was in my garret that night, and what could have taken the agreement?'

'Rats,' said Mostyn, smiling. 'One of them frightened me terribly just now; but it would not have done so if I had not been in a very excited condition. The same state of mind, perhaps, though in a milder form, that you were in on the night you wrote your agreement.'

'There were rats in the room, I remember,' said the stranger; 'but I never once thought of them.—You have saved my reason, if not my life,' and he again grasped him by the hand. 'You shall not find me ungrateful.'

Nor did he; for, aided by his influence, the young surgeon rose rapidly to fame and fortune, which he shared in the most liberal manner with the girl for whom his poverty had long kept him waiting.

MEMORIES.

Once more beneath my yearning eyes
The deep-secluded vale appears;
Once more I see the mountains rise
That, in the dimly distant years,
Beheld our bitter parting tears.

The meadow-path by which we walked
In those old days that were so sweet—
The stream that talks as then it talked—
The low-roofed church—the village street
That once was glad beneath her feet—

Each common object seems to say
With me in mute complaining moan,
'The light is parted from our day;
She once was here, but now is gone,
And we are left alone—alone!'

I wander on, yet, as I go,
The joy to view each well-loved scene
Is vanquished by the greater woe,
To think of all that might have been,
Had a hard fate not stepped between.

Farewell, once more, my heart's sad home;
Once more I go; yet, wheresoe'er,
Through length of weary days, I roam,
One memory, heart-enshrined, I bear—
This mountain valley green and fair,
And the sweet flower that blossomed there.

PRICE 1½d.

OUR YOUNG FOLKS.

By MRS LYNN LINTON.

A BOY of the period, who understood his own value and knew what was expected of him, when asked what was his duty to his father and mother, answered smartly: 'To take them out for a walk on Sundays, and not let them see how much more I know than they do.' That was a boy evidently destined to go far. For he was not, as we can see, a bad boy. He had a heart, a certain delicacy of conscience, a certain tenderness and pity, the fruit of conscious superiority. He did not wish to humiliate his parents: the honest upright father who could not construe Latin, knew nothing of sociology, and could only do good work faithfully and obey the ten commandments; the careful tender mother, who knew no more of æsthetics than the father did of the classics, and whose highest flights of ambition were to keep her house clean and her family respectable, to say her prayers with dutiful regularity, and when things went wrong, carry her cross to God, and pray for His strength to enable her to bear it. The old folks were worthy enough, and the lad had a decided weakness for them—not touching his intellect. So that he really wished to do well by them; to take them out for a walk on Sundays as a treat after their week's hard work, and to bring his mind down to a level with theirs for the time being; not paining them by his superior knowledge, but, like a young god, veiling his intellectual brightness in consideration of their weak and purblind eyes.

Not all our young folks are so considerate as this kindly-intentioned boy. Some of them delight in nothing so much as snubbing their elders and making them feel the crassitude of their ignorance and the humiliation of their inferiority. Dwarfs on the shoulders of giants, because they see a few inches beyond their bearers they assume a personal supremacy which is but another word for contempt. To them all novelty is truth, all ancient wisdom folly. Those who

know nothing about the archaic third eye know nothing about physiology in any of its branches; and he who has not read Herbert Spencer has no right to speak of morals, education, or the causes of actions. The familiar names and properties of plants, the uses to which they may be put, and the value of those uses, count for mere old wives' maunders in the estimation of our young folks who have studied botany scientifically and made themselves at home with the microscope. The glory of the starry heavens is nowhere compared with the teachings of the New Astronomy; and a well-educated young person of the present day enjoys looking up into those illumined depths only in proportion to the number of constellations he can see and the accuracy with which he can map them out. To this kind of crammed intellect the older people are flat, flabby, and empty; and all the knowledge of life got by experience—all the sympathy, the understanding, the moral insight, which come by time and sorrow, pass as so many 'rules of thumb' when tested by the scientific accuracy of weights and measures. The technically educated young person in the presence of his unscientific elders is for the most part as it were a Nasmyth's hammer when compared with a New Zealander's hatchet. To be sure, the men working the one and wielding the other do not come into court. The one may be, and probably is, a pale young fellow, the offspring of poverty, disease, grinding labour, restricted intelligence; the other is a fine stalwart granite man, with all his senses alert, his pride of manhood like a sword of power and buckler of defence, a chieftain in his own right, owning no master and afraid of no enemy. But the one pulls the levers which work the Nasmyth hammer, and the Nasmyth hammer is as powerful as an elemental force; and the other has only his hatchet, which he uses like a hero—but a hero is not the equal of an elemental force in the history of events; and science is greater than the individual. For what they have acquired technically, and for the greater strides made by technical knowledge, the educated young are before the uneducated old; but this technical knowledge is

not everything, and the deepest aspects of human life—its gravest mysteries are not touched by it, any more than a mirror gives the substance it reflects.

Together with the self-complacency quite natural to those young folks who have accumulated a larger number of facts than their elders, is a decided abatement in courtesy of manner, or such respect as age has hitherto been accustomed to receive from youth. You meet the grown-up daughter of an old friend walking with her father. You are glad to see the father; and the daughter is introduced to you. She looks at you and takes your inventory; your hair is gray, your face is puckered, and your attire is unfashionable. You are out of her pale and on the outside of her sphere. She pays you no more attention after that one comprehensive glance, which tabulates, appraises, and despises. Her eyes wander afield, and when you speak to her she does not hear you. If her attention is compelled by the unwritten law of politeness and the usages, she makes you speak to her twice before she answers you with noticeable brevity. If your conversation with your old friend outlasts her patience, you see her plucking at his coat sleeve, not too furtively, and manifesting her desire to escape with more sincerity than tact. If your old friend is disobedient to his filial monotress—if he likes this little talk with the representative of his youth, and has still some inches of the old ground to dig over, she breaks her vial without more ado, and says petulantly, 'Come, father'—which ends the little play. The father has been too well trained in the modern discipline of parents to resist, and the pretty pouter bears off her submissive captive and leaves you marvelling. What a long way we have travelled since those days when the whole assembly of the young rose as a sign of honour when the aged entered the assembly! We have made the entire circle, not yet joined; and any one of us who goes much about among his fellow-creatures can give instances of little children refusing to submit to certain things which are for their good, and resolutely holding on to practices which are evil, while the mother tamely gives in to the superior force of the infantile will, and weakly supposes they know what is best for them.

Another queer manifestation of modern youth is the hopeless pessimism of many among those who pretend to have a definite philosophy. It is odd, to say the least of it, to hear a smooth-faced, cherubic young fellow, with all life before him, softly lisping out his conviction of the illusive nature of happiness, the miserable destinies of the race, the impossibility of discovering truth, the general and final hopelessness of everything. His doubts and questionings sweep the whole chord of life. He denies the existence of vice and virtue, ~~have~~ as arbitrary terms to denote certain convenient social arrangements. Justice is only a generalised form of self-preservation, and when stripped of all its adventitious dignity will be found to be based on the *Ipod* question only. Love, as imagined by the poets and felt by the ardent young, is a ridiculous little manikin, in no respects a god. His radiant wings are only strips of muslin sewn on to a wire-frame, like the birds in the pantomime, and instead of the glorious heights of Olympus, his birthplace is in the

lowest marshlands of the race. All the manly qualities are brutal, all the feminine are weak. There is no intrinsic grandeur anywhere, and the judgment of private conscience is a superstition created by priests and the like for the better subjugation of the individual. Perhaps our cherubic pessimist confesses to the necessity for these illusions—these straps and stays, these artificial pillars of flame, and thaumaturgical shadows of a diviner light than ever was on sea or land. He is not prepared to see the whole social fabric built up by generations of lawgivers and philosophers scattered to the winds, and man return to pristine savagery, where the right of the strongest was the right divine of nature, and where the destruction of the weak was the rightful consequence of weakness. His brain, which ever receives only elemental truths, as he expresses it, those solid and gigantic bases of life, has been so far warped by heredity and environment as to accept present conditions, being unable to change them. But he sighs as he lisps out his dirges on the delusive character of life; and then in a step aside he criticises the champagne, and pronounces it too sweet and not up to the mark.

Each generation has its special characteristics—that spirit of the age which certain geniuses have before now done their best to seize, examine, understand, and dissect. Party-coloured and multiform, not one nor yet two qualities give the character of the whole, nor can the most clear-sighted see the ultimate tendency of the direction. Where we stand we know, but, not where we are going, and what is to be the working result of this curious self-assertion, this general revolt of our young folks, is a secret with the rest. The answer lies on the knees of the gods, and we have not yet unfolded the hidden writing. In times past the power of parents was excessive and their exercise of authority tyrannous. Lady Jane Grey's letter to Roger Ascham gives a tragic picture of her personal sufferings at the hands of her father and mother; and Jeanne de Navarre was another royal victim of parental despotism. 'Nips and bobs and pinches,' and still more severe castigation, came into the recognised order of things; and the father who had spared the rod would have been held as wanting in the first elements of fatherly duty and consequent kindness to his child. Moral education was a thing of precept and action, and the birch was the commentary for driving home all sorts of valuable texts, which without that commentary would never have taken root. Now our young folks resent even advice, and, as has been shown, hold themselves the superiors of those who are only their progenitors, not their masters, still less their betters. We have let the pendulum swing back just as much too far in the way of independence and self-guidance as it went on that other of subservience and fear. Our own mature experience counts for nothing, and our young folks begin the task of vital knowledge with the proverbial dance for a schoolmaster. Mothers sit supine and let their daughters conduct their own love affairs at their own best pleasure. Fathers look on and let their boys find their own way about the thorny paths of a young man's temptations and *habilities*. And the young enjoy their freedom and ramble through the unploughed

fields, where they gather all the flowers they see, and have to find by their own experiments which are worts and which are weeds, which good grain and which painted poison. No influence comes up from below; it all filters downwards. This excessive independence, this unchecked 'williness' of our young folks, comes from the relaxed discipline of the parents, not from the great bulk of independence. Naturally, that being unchecked, increases in strength, as all things left to flourish without pruning must do; but the *causa causans* is the indolence of the parents, who have ceased to direct as well as having ceased to govern. Meanwhile we may be thankful when some young first-class boy fresh from a preparatory school—some little shrimp in knickerbockers—uses leniency and generosity towards his homely forebears, and takes humane and considerate care not to let them see how much more he knows than they do.

A DEAD RECKONING.

A STORY IN NINETEEN CHAPTERS.

By T. W. SPEIGHT,

Author of *The Mysteries of Heron Dyke*, *By Devious Ways*, &c.

CHAPTER I.

'AUNT, dear, do you know what day this is?'

'If the almanac may be believed, it is the 24th of April.'

'Six months ago to-day, Gerald and I were married. I feel as if I had been married for years.'

'How dreadful to feel that you are growing old so quickly! I hope all married people don't feel like that.'

'You misunderstand me, Aunt Jane. I have been so happy since that evening last year when Gerald whispered something to me in the summer-house, that all my life before I knew him seems as unreal as a dream.'

'Such short courtships are positively dreadful. Now, when I was engaged to Captain Singleton—'

A third lady, who had been lounging on a sofa and making-believe to be intent on a novel, gave a loud sneeze and sat bolt upright. She had heard Captain Singleton's name introduced so often of late, that she might be excused for not caring to hear it mentioned again—at least for a little while.

The first speaker, Clara Brooke, was a charming brunette of twenty-two, with sparkling black eyes, a pure olive complexion, and a manner that was at once vivacious and tender. Miss Primby, the second speaker, was a fresh-coloured, well-preserved spinster of— But no; Miss Primby's age was a secret, which she guarded as a dragon might guard its young, and we have no right to divulge it. She had one of the best hearts in the world, and one of the weakest heads. Everybody smiled at her little foibles, yet everybody liked her. Just now she was busy over

some species of delicate embroidery, in which she was an adept. Lady Fanny Dwyer, the third lady, whose inopportune sneeze had for a moment so disconcerted Miss Primby, was a very pretty, worldly-wise, self-possessed young matron, who in age was some six months older than Mrs Brooke. She and Clara had been bosom friends in their school-days; and notwithstanding the many differences in their characters and dispositions, their liking for each other was still as fresh and unselfish as ever it had been.

The ladies were sitting in a pleasant morning-room at Beechley Towers, Mr Gerald Brooke's country-house, situated about fourteen miles from London. The room opened on to a veranda by means of long windows, which were wide open this balmy April afternoon. Beyond the veranda was a terrace, from which two flights of broad shallow steps led down to a flower-garden. Outside that lay a well-wooded park, with a wide sweep of sunny champaign enfolding the whole.

Clara Brooke had scarcely heard her aunt's last remark. She was seated at a davenport, turning over some old letters. On the wall in front of her hung a portrait of her husband, painted on ivory. "My own darling Clara," she read to herself from one of the letters; "it seems an age since I saw you last, and it will seem like an age till I shall have the happiness of seeing you again." What sweet, sweet letters he used to write to me! What other girl ever had such letters written to her? She pressed the paper she had been reading to her lips, then refolded it, and put it away and took up another.

'Ah, my dear,' remarked Lady Fanny, turning to her friend, 'as you remarked just now, you have only been a wife for six short months, and of course everything with you is still *couleur de rose*. But when you have been married as long as Algy and I have, when the commonplace and the pride begin to assert themselves, as they do in everything and everywhere, whether you like it or not, then I am sure you will agree that the scheme of married life my husband and I have planned for ourselves has really a good deal to recommend it to all sensible people.'

Miss Primby pricked up her ears. 'You excite my curiosity, dear Lady Fanny,' she said. 'I hope you won't refuse to gratify it.'

'Why should I?' asked Lady Fan with her merry laugh. 'We want converts, Algy and I; and who knows, my dear Miss Primby, but that some day—eh? Well, this is our *modus vivendi*—I believe that's the correct term, but won't be sure. About eighteen months ago—we had then been married a little over a year—Algy and I came to the conclusion that married people ought not to be too constantly together if they wish to keep on good terms with each other. Algy's contention is that half the quarrels and scandals which come out in the newspapers are simply the result of people seeing so much of each other that at last they are impelled by some feeling they can't resist to have what he calls "a jolly row," just to vary the monotony of existence. And then, as he says, one "row" is sure to lead to another, and so on. When once the match is applied, no one can tell where the conflagration will stop. Now, although ours was a love-match, if ever there was one, we had not

run together in harness very long before we made the discovery that in many things our likes and dislikes were opposed. For instance, next to me, I believe Algy loves his yacht; whereas I detest yachting: it seems to me a most stupid way of passing one's time. On the other hand, I delight in going from one country-house to another and visiting each of my friends in turn; while Algy, dear fellow, is always awfully bored in general society, especially wherever a number of our sex happen to be congregated. Thus, it has come to pass that at the present moment he is somewhere in the Mediterranean, while I—well, *je suis ici*. Algy and I never give ourselves time to grow tired of each other; and when we meet after being apart for a month or two, our meetings are “real nice,” as my friend Miss Peckover from New York would say.

Miss Primby shook her head. ‘I am afraid, dear Lady Fanny, that your opinions on such matters are very heterodox, and I can only say that I hope Clara will never see fit to adopt them.’

‘Not much fear of that, Aunt Jane,’ answered the young wife. ‘Fancy Gerald and me being separated for a month or six weeks at a time! But it is quite out of the question to fancy anything so absurd.’

Lady Fan laughed. ‘Wait, my dear, wait,’ was all she said as she turned again to her novel.

Clara Brooke shook her head; she was in no-wise convinced.

‘Gracious goodness! whatever can that be?’ ejaculated Miss Primby with a start.

‘Only Gerald and the Baron Von Rosenberg practising at the pistol-range. It is an amusement both of them are fond of.’

‘An amusement do you call it! I wish they would practise their amusements farther from the house, then.—Heaven preserve us! there they go again. No wonder I have broken my needle.’

‘It’s nothing, Aunt Jane, when you are used to it,’ responded her niece with a smile.

‘Used to it, indeed! I should never get used to it as long as I lived. I have no doubt this is another of the objectionable practices your husband picked up while he was living in foreign parts.’

‘Seeing that Gerald was brought up in Poland, and that he lived in that country and in Russia from the time he was five years old till he was close on twenty (I think I have told you before that his grandmother was a Polish lady of rank), I have no doubt it was while he was living in those foreign parts, as you call them, that he learnt to be so fond of pistol-practice.’

At this moment there came the sound of two pistol-shots in quick succession. Miss Primby started to her feet. ‘My dear Clara,’ she exclaimed, ‘if you don’t want my poor nerves to be shattered for life, you won’t object to my going to my own room. With plenty of cotton wool in my ears, and my Indian shawl wrapped round my head, I may perhaps—Dear, dear! now my thimble’s gone.’

‘Why, there’s your tumbler, aunt, on your finger.’

‘So it is—so it is, dear. That shows the state of my poor nerves.’

‘Will you not stay and say good-bye to the Baron?’

‘No, my dear; I would rather not. You must

make my excuses. Of course, you could not fail to notice how the Baron ogled me at luncheon. He puts me so much in mind of poor dear Major Pondicherry. But I never cared greatly for foreigners; besides, he will smell horribly of gunpowder when he comes in.—There again! Not another moment will I stay.’

Clara Brooke’s face rippled over with suppressed laughter as Miss Primby left the room. Then she turned to her letters again, and tied them up with ribbon. ‘I have heard that some people burn their love-letters when they get married,’ she mused. ‘What strange beings they must be! Nothing in the world would induce me to burn mine. Sweet silent messengers of love, what happy secrets lie hidden in your leaves!’ She pressed the letters to her lips, put them away inside the davenport, and locked them up.

Just as she had done this, the pompous tones of Bunce, who filled the joint positions of majordomo and butler at the Towers, became plainly audible. Apparently he was standing outside the side-door and addressing his remarks to some one on the terrace. ‘Now, the sooner you take your hook the better,’ the two ladies heard him say. ‘We don’t want none of your kidney here. This ain’t no place for mountebanks—I should think not indeed!’ Mr Bunce in his ire had evidently forgotten the proximity of his mistress.

Clara crossed to one of the windows, and looking out saw, some little distance away, two strange figures slowly crossing the terrace. One was that of a man whose costume of a street tumbler was partly hidden by the long shabby overcoat he wore over it, which was closely buttoned to the chin. Over one shoulder a drum was slung, and in his left hand he carried a set of Pandean pipes. The second figure was that of a boy some eight or nine years old, who had hold of the man’s right hand. Under one arm he carried a small roll of faded carpet. In point of dress he was a miniature copy of the elder mountebank, minus the overcoat. His throat was swathed in a dingy white muffler, while his profusion of yellow curls were kept from straying by a fillet round his forehead embroidered with silvered beads.

‘Poor creatures,’ said Clara to herself. ‘Bunce had no business to speak to them as he did. How dejected they look, and the child seems quite footsore.’

At this juncture the man happening to turn his head, caught sight of her. She at once beckoned him to approach.

The mountebank’s face lighted up and all signs of dejection vanished in a moment. He had some kind of old cap on his head. This he now removed, and bowed profoundly twice. It was a bow that might have graced a drawing-room. Then he and the boy crossed the terrace towards Mrs Brooke.

‘Fan, I want you; come here,’ said Clara to her friend.

Lady Fanny rose languidly and crossed to the window.

What struck both the ladies first of all, as the vagrants drew near, was the remarkable beauty of the child. His face at the first glance seemed an almost perfect oval; his complexion, naturally fair and transparent, was now somewhat embrowned by exposure to the sun and wind. He had large eyes of the deepest and tenderest blue, shaded by long

golden lashes; while his lips formed a delicate curve such as many a so-called professional beauty might have envied.

'He looks more like a girl than a boy,' whispered Lady Fan.

'He looks more like a cherub than either,' responded Clara, who was somewhat impulsive both in her likes and dislikes. 'It is a face that Millais would love to paint.'

The appearance of the man was a great contrast to that of the child, and a casual observer would have said that there was no single point of resemblance between the two. Apparently the former was about forty to forty-five years of age. He had a sallow complexion and a thin aquiline nose; his black locks were long and tangled; while into his quick-glancing black eyes, which appeared to see half-a-dozen things at once, there would leap at times a strange fierce gleam, which seemed to indicate that although the volcano below might give forth few or no signs, its hidden fires were smouldering still. Only when his eyes rested on the boy they would soften and fill with a sort of wistful tenderness; and at such moments the whole expression of his face would change.

'I am extremely sorry,' said Mrs Brooke, 'that my servant should have spoken to you just now in the way he did. He had no right to do so, and I shall certainly ask my husband to reprimand him.'

'It was nothings, madame, nothings at all,' responded the mountebank with a little bow and a smile and a deprecatory motion of his hands. 'We are often spoken to like that—Henri and I—we think nothings of it.'

'Still, I cannot help feeling greatly annoyed.—Is this pretty boy your son?'

'Oui, madame.'

'His mother?'

'Alas, madame, she is dead. She die six long years ago. She was English, like madame. Henri has the eyes of *ma pauvre* Marie; and his hair, too, is the same colour as hers.'

Although the man spoke with a pronounced foreign accent, his English was fluent, and he rarely seemed at a loss for a word to express his meaning.

'Poor child! ' said Mrs Brooke. 'This is a hard life to bring him up to. Surely some other way might be found?'—Then she paused.

The mountebank's white teeth showed themselves in a smile. 'Ah no, madame; pardon, but it is not a hard life by no means. Henri likes it, and I like it. In the winter we join some *circus*, and then Henri has lessons every day. He is *clevare*, very *clevare*—everybody say so. One day Henri will be a great artiste. The world—*tout le monde*—will hear of him. It is I who say it—not.' He touched his chest proudly with the tips of his fingers as he ceased speaking. 'Would mesdames like to behold?'—he said a moment later, as he brought his drum into position and raised the pipes to his lips.

'Thank you, monsieur; not to-day,' answered Clara gravely as she stepped back into the room and rang the bell.

Monsieur looked disappointed. Henri, however, looked anything but disappointed when, two minutes later, the beautiful lady, from whose face he could scarcely take his eyes, heaped his little hands with cakes and fruit till they could hold no more.

'Tell me your name, my pretty one,' said Mrs Brooke, as she stooped and helped him to secure his treasures.

'Henri Picot, madame.'

'And have you any pockets, Henri?'

'Oui, madame.'

A pocket was duly indicated, and into its recesses a certain coin of the realm presently found its way.

Before either Picot or the boy had time to give utterance to a word of thanks, a servant entered the room, and addressing Lady Fan, said: 'If you please, my lady, the carriage is waiting; and Miss Primby desires me to tell you that she is ready.'

'Good gracious, Clara,' said Lady Fan, 'I had forgotten all about my promise to accompany your aunt in her call on Mrs Riversdale. I wish to goodness you could go with us. I dread the ordeal.'

'And leave the Baron Von Rosenberg without a word of apology! What would become of my reputation as a hostess? Gerald and he will be here in a few minutes, I don't doubt; and if you like to wait till he is gone'—

'That would never do,' interrupted her friend. 'You know what a fidget your aunt is when she is kept waiting. You had better come and keep her in good-humour while I am getting my things on.—By-the-bye, where can our singular friends have vanished to?'

Clara looked round. Picot and the boy had disappeared. Neither of the ladies had seen the start the mountebank gave at the mention of Von Rosenberg's name, nor how strangely the expression of his face changed. Clutching the boy by one wrist, he whispered: 'It is time to go. Venez, mon p'tit—vite, vite! The ladies want us no more.'

'The man was French, and he seems to have taken the proverbial leave of his countrymen,' said Lady Fan with a laugh.

Mrs Brooke was a little surprised, but said nothing. The two ladies left the room together.

EARLY MARINE INSURANCE.

THE history of marine insurance is interesting. From the early days of Greece and Rome such a system of insurance has been in use. But the first explicit statement in writing regarding marine insurance is found in an edict of Justin Martyr of the year 533 A.D. He decreed twelve per cent. to be the lawful amount of profit for the insurance of goods on land, but granted twenty per cent. to marine insurers on account of the additional risks entailed. The ancient system of insurance was called *Bottomry*—in other words, the ship was mortgaged. If the ship was lost, the lender likewise lost the money advanced on her; but if she arrived safely at her port of destination, he not only got back the loan but also the premium previously agreed upon.

The merchants of the Steelyard were the first marine insurers of Great Britain. They were Germans, and came to this country in the reign of Edward IV. The merchants of the Steelyard settled in London, built houses, and became the representatives of the Hanseatic League. They were a curious company; they lived like monks in a monastery, were not allowed to marry, or even to speak to the fair sex. The gates of their premises were closed at a certain hour at night,

and opened late or early in the morning according to the season of the year. A breach of any one of these rules meant instant expulsion. On New-year's eve the Steelyard men met and elected a chief, who presided over a council of eleven chosen from their ranks; and on New-year's day the chief was installed into his office, which he retained for one year only.

These aliens in time grew wealthy; for not only did they hold a monopoly of marine insurance, but they also had peculiar privileges in the way of trade granted to them by the early kings of England, who for such privileges received large sums of money to carry on their wars. The people of Britain naturally resented such favours shown to foreigners, and again and again this resentment manifested itself in the frequent assaults made by the London populace on the warehouses of the Steelyard men. At length in 1597 public opinion grew so strong against the Germans that an Act was passed ordering all foreigners to leave the country on pain of heavy penalties. By way of reprisals, the cities of the Hanseatic League placed restrictions on British imports. It was of no use; the edict of Queen Elizabeth had to be obeyed. The old houses in which these Steelyard men carried on their business of banking, shipping, and marine insurance stood till the year 1863; but now Cannon Street railway passes over their site. The system of marine insurance followed by these Steelyard men was that which we in a former part of our paper defined as bottomry.

When the Jews, towards the end of the thirteenth century, after being persecuted and maltreated in every possible way, fled from England, their place as financiers was taken by the Lombards. These Lombards consisted of merchants from Genoa, Lucca, Florence, and Venice, who, as insurers, money-lenders, and bankers, soon established themselves in England. The name of Lombard Street, in London, is a memorial still left of them; and among other terms which they are believed to have introduced into our language is the immortal *L. s. d.*, which was originally used to represent their *libri, solidi, and denarii*. These Lombards were active and pushing men; they had an agency at Inverness, and one of their projects was to build a 'marine establishment' at Queensferry, now rendered famous by the stupendous Forth Bridge. Like their German friends, they soon possessed themselves of much of the country's trade; but the same edict which drove the Steelyard men from London was also sufficient to make these Italians leave for ever the shores of England.

After these men left, the English people themselves took up the matter of insurance. An Act was passed to render this more easy. A Board of Insurance was formed, composed of merchants and lawyers; this Board had for its aim the settling of all disputes; but its meetings were few, and the whole system fell into disrepute. The chief insurers were notaries of public and brokers. In the year 1602 a man named Candler applied for a patent to enable him to have the sole right of marine insurance; this raised the ire of the men into whose hands all the insurance of the country had fallen, and it was to appease their wrath that the Council of Insurance was formed. The Council was composed chiefly of

the complaining class, and therefore did very little to bring about what Candler and others had petitioned for.

Our chief information regarding these old insurance agencies is derived from a work commonly called *The Guildon*, published at Rouen between the years 1590 and 1600. The author's name is unknown; but in all probability it is the combined efforts of a few men. In this very able work we obtain a good definition of marine insurance, as also the various rules to which all insurers and insurance companies had to submit. Thus, all insurances had to be made in writing; such was not always the case, for merely verbal statements were sufficient to insure a vessel. This last method, however, was liable to cause misunderstandings, disputes, and forgeries; hence it was deemed illegal and non-binding.

When an insurance was agreed upon, it had to be signed in the presence of a registrar and enrolled as a public Act. Without this registrar's sanction all insurance bargains were null and void. The registrar had to be a man of intelligence, of sobriety, and of 'good repute'; he was required to live in a populous part of the town, and have above his door a sign with the words 'Office of Insurance.' For signing this insurance mandate the registrar received the half of a quarter per cent. for every hundred livres, and so on, rising in value according to a fixed scale.

The registrar of insurance was bound to keep in his office a box, into which those who obtained policies were forced to put, over and above the half of a quarter per cent. paid for the insurance policy, a certain fixed sum, according to the extent of their transactions. The money thus collected was partly given to the poor of the district, and partly for the benefit of shipwrecked mariners. This did not, however, end their contributions. Outside the registrar's door there was another box for the reception of 'God's pence,' which money was used for the ransoming of all travellers and seamen captured by pirates.

At the time of the crusades, it was no unusual thing for men to insure their lives against capture; and the insurers had to pay whatever ransom might be demanded for their release. But those who had no insurance policies simply depended on the money put in the boxes for the reception of 'God's pence.'

The end of the sixteenth century saw the establishment of insurance companies all over England. Vessels were insured for five months when their voyage was to Flanders, England, Portugal, and Norway; for twelve months when the ship sailed to the coast of Italy, Azores, Peru, Brazil, or the Indies. Notification of loss was received for the former till the end of three months; but six and even twelve months were permitted for the latter. When these stated times had elapsed, no claim could be admitted, whatever the excuse might be.

Assurance policies were paid in England although the original transaction had at first been settled on the Continent; and of course what was first settled in England could likewise be discharged on the Continent. It is evident, then, that there must have been rapid progress made in the way of insurance companies.

The earliest English policy in the possession of antiquaries dates back to the year 1613. It

was discovered in the Bodleian Library, Oxford. We venture to transcribe a few sentences of the quaint document: 'In the name of God, Amen: Be it knowne unto all men by these presents that Morris, Abbot and Devereux Wogan of London Marchants doe make assurance and cause themselves and everye of them to be assured lost or not lost frome London to Zante Petrasse and Saphalonia or any of them upon woollen and linnen cloth, leade kersies, iron and any other goodes and merchandize heretofore laden aboarde the good ship called the tiger of London (whereof Thomas Crowder is master under God in this present voyedge) of the burthen of 200 touns or thereabouts, &c.

At the period this policy was taken out, we hear very little of the Court of Insurance. Indeed, in the reign of Charles II. we know that the King's Bench on several occasions was in direct conflict with this insurance court. Gradually the disputes regarding insurance were referred to the ordinary courts of law, which now settle all such matters.

When we reach the eighteenth century, we find that marine insurance is now, more than ever, a good paying concern; but to give any details regarding that period is not our intention, because we know it is on the foundation of that past that the present system of marine insurance is formed. By way, however, of showing to what extent marine and other insurances had taken hold on the British public, we submit the following curious list. The time was that in which the South Sea Bubble was all the cry. The list runs thus: 'An Insurance for insuring and increasing Children's Fortunes;' 'Insurance from Death by drinking Geneva;' 'Assurance from Lying;' 'Insurance from Housebreakers;' 'Rum Insurance;' 'Insurance from Highwaymen.' These are only a few of the senseless and absurd schemes of insurance which were foisted upon the British public at a time when that public seemed capable of believing any amount of nonsense.

JOHN VALE'S GUARDIAN.

CHAPTER XXXVIII.

THE voice of Mr Shorthouse reached Snelling's ears, and those of Tobias Orme also, for it was at this time that the murderous plotter was engaged upon his guilty work. Orme saw him start and stare out of the archway with eyes of terror. Then he saw him huddle up the newspaper he had spread upon the turf to catch the falling fragments of mortar, and cram it away into the centre of a clump of thick grum bushes near at hand. Next he restored to their places the bricks he had removed from the arch, and coming out upon the open ward, stood still for a moment, manifestly endeavouring to remove all signs of emotion from his face. When he thought he had succeeded, he answered Shorthouse's repeated calls with a boisterous 'Hilly ho!' and walked in the direction of the gate, leaving Mr Orme in his hiding-place, full of the wildest conjectures as to the value of the treasure-trove which could so excite a man of Snelling's wealth and solidity of character.

'What bee'st locked in for i' this way?' Shorthouse demanded as Snelling came in sight.

'Anybody as finds the gates open,' Snelling answered, 'thinks he's got a right to come in here and poke his nose anywher he likes to. There's nobody about the place but myself just now. I'll let thee in, in a minute. This fastening's a bit rusty.'

'Bob, ode lad,' said Shorthouse, 'thee been't looking well.'

'I'm worried,' returned Snelling growlingly, as he tugged at the rusted fastening of the gate.—'I'm worried. I don't eat my victuals; I can't sleep o' nights.' He looked, if Shorthouse had had the fancy to think of it, like some wild thing tearing at the bars of his cage.—'Come in,' he said, when he had at length withdrawn the fastening. 'I'm glad to have anybody about; I'm not so good at being lonesome as I used to be.'

'That's a stroke at what I'm here for, Bob,' returned the farmer. 'Let's go into the house. Give me a drop o' beer. Theer's nothin' meks a man so dry as anger.'

Snelling drew a jug of ale from a cask in his housekeeper's room and set it before his visitor. Shorthouse took a lengthy pull at it and returned it noisily to the table. 'Bob,' he said, 'be you i' the same mind as you used to be in about marryin' my Cecilia?'

'Is it any good for me to be o' that mind?' Snelling asked in turn.

'Yes or no?' cried Shorthouse, beating on the table with his clenched hand. 'Be you i' the same mind?'

'I'm not one o' them featherheads as are o' one mind one day and another the next,' said Snelling.

'Very well,' said Shorthouse. 'You can marry the gell in four weeks' time from now.'

Snelling, who had taken a seat on the opposite side of the table to his visitor, rose at this and thrust out his right hand with a fierce gesture towards Shorthouse. The farmer rose also and accepted it, and the two shook hands across the table.

'That's a bargain,' said Shorthouse. 'Theer's blood in it too,' he added, laughing.—'What ha' you been doin' at your knuckles, Bob? You've gashed 'em somehow.'

'It's nothing,' Snelling answered. 'I was a-doin' a bit o' rough work this mornin'—and my hand slipped. I hit my knuckles agen the wall, I reckon. I hardly knowed about it.'

'I'll tell thee what I'm goin' to do,' said Shorthouse. 'That wench o' mine has got her head full o' that young Frenchman. Me an' her's had a bit of a shindy this mornin', and I've told her as I'm goin' to put a finish on all her nonsense. If youn willin' to tek her just as her stands, with her craze about the frog-eater as well as everythin' else her's got, I'll start this hour, and see as the bands is cried in church next Sunday mornin'.—I've got a very pretty penny, Bob, and when I'm gone, yer'll have the lot on it.'

'Never mind that,' said Snelling; 'all that's nothing to me.'

'You've changed, then,' said Shorthouse dryly.

'Yes,' said Snelling, with a suppressed rage in his face and voice; 'I've changed. Time was I wouldn't ha' married her, or dreamed o' marrying her, without her lands. You can send

her now as naked as a robin, if you like.—I can't eat,' he flashed out; 'I can't sleep. I'm a fool about the wench.'

'That's how the cat jumps, is it?' Shorthouse answered, laughing. 'I've allus heard it's pretty hard on the middle-aged uns; but I never remember to ha' seen a case afore.—All right, Bob. Come along wi' me; we'll get that bit o' business o'er at once.'

'Sit there a minute,' said Snelling. 'I'll get a wash and come back directly.'

The unexpected turn of fortune coming on the horrible emotions of the last half-hour had set him shaking like a woman. He would fain have been alone, to realise in his own thoughts the chance that had befallen him, and yet he was so far afraid of himself that he clung to Shorthouse's companionship.

The two went to the parish clerk together and there gave instructions for the calling of the banns of marriage between Robert Snelling, widower, and Cecilia Shorthouse, spinster; and then and there separated to go their several ways. Snelling could not go back to his horrid work again that day; he had no nerve for it; and Tobias waited and pined in vain, until sheer hunger drove him home.

The farmer, re-entering his own house, hung up his hat, searched for a new Broseley, filled and lit it, and sat down contentedly, altogether satisfied with the masterly stroke he had just played. None of your contumelious daughters for Farmer Shorthouse. He knew how to manage 'em. The whole country-side would know what he had done, and he would be cited as a pattern of parental authority whenever foolish girls ran counter to it. As for the girl being unhappy when once she was married and settled, that, of course, was all nonsense. He was in no haste to communicate his news to Cecilia; but he was in no dread of it either; and when the girl, with swollen eyelids and scalded cheeks, came down, in obedience to his call, to the mid-day dinner, he gave her his news with a cheerful unconscious brutality which was at least as easy to endure as any finesse could possibly have been.

'I've been to see Bob Snelling,' he said, as he plunged the carving-fork into the sirloin before him, 'and him and me has been together to put the bands up next Sunday and the two Sundays following for your wedding along with him.' He spoke deliberately, carving the while, and set a plentiful portion before the girl. Then he helped himself and fell-to with a robust appetite.

'Father,' said Cecilia, in a tone so low that at first he scarcely heard her, 'I shall never marry Mr Snelling.' Her face was deathly white, and there was a look in her eyes which her father had never seen there before.

'That, you see, my wench,' he responded, with his mouth full of beef and greens, 'is wheer you and me is of two different opinions.'

'Father,' she said again. 'I shall never marry Mr Snelling.'

'You're mistook, my gell,' he responded with a cheerful indifference. 'You and Bob Snelling'll be married next Monday fortnight. You can begin a-thinking about the wedding dresses as soon as ever you like. Theer's all your mother's things up-stairs as you can pick and choose from.

Theer's a silk or two up there in the big press as'll stand by 'emselves, and has got a hundred years o' wear in 'em.'

'You don't know what you're doing, father,' said the girl, rising with her resolute white face and frightened eyes—you don't know what you're doing.'

'Rubbidge, my wench, rubbidge,' responded the farmer, and went on comfortably with his dinner after Cecilia had left the room.

That afternoon Jousserau, with very little heart for his work, sat at his easel with a typical yokel posed before him. He knew that he was painting badly, and that everything he did would have to come out again; but in spite of that knowledge, he went on with no other object than to hold thought at a distance. Somewhere about three o'clock, Isaiah came tapping at the door, and being admitted, showed a countenance of unusual gravity.

'You can do without this lad a minute,' he said. 'Best send him down into the kitchen. I've got summat important to say to thee.'—The yokel being dismissed, Isaiah sat down with an air of mystery and importance, but almost immediately rising, took a bottle of cognac from a sideboard, poured out a glass from it and set it on the table.

'In case you should be in want o' that,' he remarked, 'it's handy. It might do you no-harm if you was to tek it now.'

'What is the matter?' Jousserau asked him in surprise.

'Why,' returned Isaiah, 'I've just happened to pass by the parish clerk's; and him bein' a oldish chum of mine, and me not liking to be 'aughty with the man because I'm a bit better off than I used to be, I dropped in, so to speak, to have a word along wi' him. I meant to pass the time of day with him, and no more; but all of a sudden he up and tells me a thing as knocked me as high as a kite. "Mr Snelling," he says, "and Mr Shortus," he says, "has been here this morning," he says, "to put up the bands o' marriage between Robert Snelling, widderer, and Cecilia Shorthouse, spinster."—You'd better take that drop o' brandy, Mr Jousserong; it'll do you good.'

'I do not understand,' said Jousserau, waving the proffered glass aside. 'What is it, the bands of marriage?'

'Bob Snelling and Miss Shorthouse,' explained Isaiah, 'are going to be cried in church next Sunday. The names'll be called out three Sundays running; and then, in the natural course o' things, the two'll get married.'

'I will not believe it,' cried the artist, rising to his feet.

'You've got to believe it,' Isaiah answered. 'I've seen it in the clerk's own handwriting. It's only possible to believe as the young woman has gien in her consentment; and what you've got to do, Mr Jousserong, is to pluck up a sperrit and think no more about her.'

'No,' said Jousserau staunchly, 'that I shall not believe. She has not consented. They have done it without her will, without her knowledge. She does not care for Mr Snelling.'

'That's like enough,' returned Isaiah. 'But if her's been frightened into it, her ain't the first young woman that has happened to.'

'I will not believe it,' said Jousserau again, and indeed his whole heart rose in revolt against the fancy. 'You know?' he said, tapping at his breast to indicate himself. 'I have never spoken a word about it; but you know, and that is why you bring this news to me.'

'I know?' said Isaiah. 'The parish knows. It's talked about at the town-pump, if that's any comfort to you.'

The two sat silent for a while; and Jousserau, mechanically taking up his palette and brushes, laid an absent-minded touch or two upon the canvas with an air of profound study; then he laid his tools down again and turned to face Isaiah. 'I shall go and find out,' he said; 'I will know the truth.'

'Don't you make a fool of yourself,' Isaiah advised in rough friendship.

'I must know the truth; I will know the truth,' cried Jousserau, rising. He spoke with a fierce gesture, the southern flame flashing out of him for the first time.

'Yes, yes, yes,' returned Isaiah; 'so you may, but you mustn't make a fool of yourself, all the same. I'll tell you how we'll manage. Mrs Winter and Miss Shorthouse has allus been pretty good friends. It was mere hazard as I found out what happened. Old Shorthouse'll never guess as the missis'll know anything about it, and her can mek a call on Cecilia and spy out the land, d'ye see.' Isaiah gouged this idea into Jousserau with elaborate workings of the thumb, and accompanied it with many persuasive winks and nods. Jousserau hailing it eagerly, Isaiah went out upon the landing and shouted to his wife to ascend.

'Cecilia Shorthouse marry Bob Snelling!' cried Mrs Winter shrilly, when Isaiah had communicated his news to her. 'Never! this world, with her own good-will.—No, no, Isaiah; never you believe it.—Go down and find out for you, Mr Jousserong? To be sure I will. Her shall never marry that hunk, as I suffered and trembled under for 'ears and 'ears, if anything I can say can put a stop to it.—Why, I do assure you, Mr Jousserong, I've knowed that man grumble for five months on end about a button as was off the back of his shirt-collar. He's never twice i' the same mind about his breakfast bacon the wull year round; and as for his heggs, he'll have 'em hard-biled one morning and soft-biled another morning, enough to drive you mad with worry.'

Mrs Winter lost no time in assuming the black silk of ceremony, and even on this occasion dared to wear the wonderful bonnet which Jousserau had brought home from Paris six months before. My lady Barfield had appeared in church in a structure less splendid and imposing; and the county member's wife had worn a bonnet which, as Mrs Winter declared, might have been twin-sister to her own. The flower-stuffed Norman arch was sanctified by fashion; and the good woman put it on and carried it down the lanes with pride.

Shorthouse was away from home when she reached his door; and Miss, Cecilia, who was occupied with her tears, had locked herself in her chamber and would at first see nobody. The big ruddy servant-girl told the visitor enough to assure her that the match Shorthouse was forcing on was unwelcome to his daughter. The servant knew nothing about the reason of her mistress's

tears, but said she: 'Miss Cecilia's a-crying like a watering-cart. I've knocked at her door three times and her teks no manner o' notice.'

'I'll have a try,' said Mrs Winter, and so mounted the stairs and knocked at Cecilia's door. The servant-girl pointed it out to her and stood agape with interest.

'Go away!' said a weeping voice from within. 'I don't want anything. Leave me alone.'

'My poor dear darlin',' said Mrs Winter, beginning at these mournful accents to snuffle on the outside of the door. 'It's me as has come to say a comfortin' word to you.—Let me in, there's a love.'

The maid, like the foolish fat scullion in Sterne's immortal story, blubbered into sudden tears and ran away with her apron over her head.

IN A WELSH FARMHOUSE.

It is a little past two o'clock in the afternoon, and as I look out of the window of the farmhouse across to the opposite mountains, the whole valley seems asleep under the burning sun, which pours down upon barren rock and green field, till the cattle forsake the meadows and herd together under the trees, whisking their tails backwards and forwards and chewing the cud with lazy philosophy. It is so still, that the little trout stream which rushes over its pebbly bed seems quite noisy, and sounds as if it were protesting against the great noontide stillness that hangs over the mountains. Suddenly, three petulant ear-piercing screams ring up from the valley below; and seizing a straw hat, I rush out into the garden, for the whistles are the signal that the train is coming with the newspapers. Presently the tiny engine comes snorting up the hill, dragging its three toy carriages and guard's van after it, and passes through the yard behind with a roar as of distant thunder, that makes the old house tremble. The guard is on the lookout, and as he goes by, throws out my paper, watching me catch it day after day with never-failing amusement.

It is a charming place in which to pass the summer, this quaint village hidden away among the Welsh hills; but in winter, when the winds whistle down the valley, and the mountains are blotted out by the rain-clouds, it must be anything but a lively abode. It is so off the ordinary track, and is so fortunate in possessing nothing that has attained to guide-book immortality, and in having only the lovely scenery of wood and forest, vale and stream, common to most of the Welsh districts, that a tourist is rarely seen, and no swarms of cheap-trippers invade our peaceful solitude. And yet we are on the highway between two county towns; but the road seems seldom used, except by the 'road-inspectors'—as the tramps are playfully called—who stop in our village and present relief tickets for a loaf of bread on their march from one centre to the other. The comical little rail-

way with its two-foot gauge is really only a mineral line; but three times a day the sturdy engine with its miniature carriages runs down to the town and returns snorting and puffing up the six miles of hill, very often with only a single traveller. Occasionally, a long train of six or seven carriages is made up, every available inch of space is crowded, and men and boys stand on the platform outside the carriages, before and behind, all in their best black broadcloth coats, and the women in their best black dresses. If it is not the day of the weekly market, or of the half-yearly fair in the town below, we know it can only be one of two things—a prayer meeting or a funeral. These simple people love prayer meetings, but a funeral is their chiefest joy. Even a wedding is as nothing compared with a burying. Every relation goes; and as everybody is connected with everybody else in the valley, no work is done on that afternoon; and men, women, and children, dressed in their best, crowd the carriages of the little railway, and, undeterred by distance, go off to the funeral. After the ceremony, if the family are well enough off, they provide unlimited tea, coffee, and perhaps something stronger, for the guests and relatives; and it is considered a very unneighbourly thing to omit to see a relation or friend to his last resting-place.

It is indeed a land of slate. There is only one industry in the village—that is, slate-quarrying: there is only one material for building and roofing the houses—that is, slate. They mend the roads with slate; they make their pigsties of upright slabs of slate, with other slabs across for the roof; they floor their kitchens with slate; and if they want to fasten a gate—of which the gate-posts are of slate—they put a large piece of slate against it. Slate is everything and everywhere, and its soft gray harmonises well with the green of the grass and the blue of the sky in summer, and lends an additional horror to the sombre masses of rain-clouds and leaden skies of winter. If the farmer wants to make a fence, he sends up to one of the quarries, and for a few pence gets a cartload of ends sawn off the slabs of slate. He picks out pieces about five feet long, and then, having made a row of holes with a crowbar where he wishes his fence to be, he rams in the great pieces with a wooden mallet, and twisting a double strand of wire in and out near the top, in a short time has erected a barricade which it is utterly impossible to climb and very difficult to pull up. Now and then a cow, miscalculating the strength of the slate hedge, and flattering herself that the farmer has erected a magnificent row of scratching posts for her special behoof, comes to grief over it; but a few blows of the mallet soon repair the damage; and the cow having learned wisdom from that hardest of teachers, experience, avoids the fence for the future, as being simply a trap for the unwary.

The farmhouse is a very old building of two stories—so old, indeed, that it is not made of great blocks of waste slate, like nearly every other house in the valley, but of the rock that covers the slate vein, and which has to be removed before the 'stone,' as they call it, can be got

at. In front of the farm is a little flower and vegetable garden; and then at the bottom of a steep slope a green meadow running down to the bush-fringed trout stream that forms the boundary of the county. There are three meadows along the stream in the farmer's occupation, and they with the farmhouse and out-buildings constitute his holding, for which he pays twenty pounds a year. Originally it formed but a part of a large farm which included nearly all the arable and grazing land in the village on our side of the stream; but so scarce is land in the valley and so great was the competition for the farm, that the landlord cut it up into three or four small holdings, in order to satisfy as many people as possible. Across the stream is a field belonging to another owner, for the grazing rights of which the farmer pays as much as he does for the entire farm he holds of his own landlord. It is not much of a farm, according to English notions, for there is only a little patch of oats sown in one corner, and all the rest is left to grass. However, the meadow-land produces a splendid crop of hay, and provides pasturage for the half-dozen cows and the few sheep that the farmer keeps through all the year.

The cows are the 'ladies that pay the rent' here. The farmer's wife is a keen and skilful dairywoman, and with the aid of a rough country lass, she manages the whole dairy herself; and every evening at six o'clock her back-door is besieged by children carrying cans and jugs of all shapes and sizes, for her milk has quite a celebrity, as being the best and purest in the valley. In fact, the demand greatly exceeds the supply, and she could sell three or four times as much as her cows produce. Among the purchasers are two girls with babies in their arms; neither of them looks more than a child, and yet they are the mothers of the infants they carry. One of them has married her step-father, and lives with him in a solitary hut far up the mountains. She is a shock-headed, silly-faced girl, who grins stupidly when she is rallied on her step-father husband and baby. Her case is not considered so very extraordinary. When her mother died, she naturally drifted into the wife's place; and the strangest part of the story is perhaps that they took the trouble to come to chapel and go through the ceremony of marriage. The other girl was married at fifteen to a young quarryman only a year or two older than herself and who earns fifteen shillings a week. This adventurous couple began house-keeping in an empty room with an old powder keg as their sole article of furniture; but by the time the fat and stolid baby arrived, they had succeeded in getting together a few necessities. People marry young in this country, and families of eighteen or twenty are by no means rare, many an elder son having children older than his younger brothers and sisters; and as there are only about a dozen names which have to do duty indifferently for Christian and surnames, a stranger gets extremely puzzled as to the relationships, and ceases to wonder that Jones is a common name.

The farmer is a splendid specimen of a man, tall, broad-shouldered, with a handsome and refined face, and speaking English with a soft and musical

Welsh accent. He and his gray horse work the farm between them, though there does not seem much to be done on the little holding except at haymaking time. At the top of one of the meadows and just under the railway is a small patch of allotments, sown with potatoes and other vegetables. Occasionally a woman will come in of an afternoon to hoe one of these patches; or perhaps a man comes in the evening after his day's work in the quarry is done, for these bits of ground are given by the farmer to his neighbours on condition that they help him at haymaking time. Then, if the weather is fine, there is quite a scene of old-fashioned rustic merry-making. The neighbours come whether they have allotments or not, armed with their scythes, and each one anxious to take his turn in the meadow. They set to work with a will, and the grass falls in long swathes before the regular swing of their scythes. Behind them come their wives and daughters with great wooden forks and rakes, tossing the freshly-cut grass and spreading it out over the field; while the children roll on the ground or pelt one another merrily, and drink in the sweet scent of the new-mown hay. Meanwhile, inside the house the goodwife and half a dozen of her gossips make ready a huge bowl of flummery for the harvesters' supper, and supplement it with chunks of bread and cheese and plenty of small-beer. Very little work is done during the day, the hay being left to dry in the sunshine, as nearly all the men are in the quarries; and it is not till after six that the neighbours arrive, and the mowers' scythes flash under the rays of the setting sun.

When the long shadows of the mountains deepen over the valley, and the course of the stream is only marked by the long line of dense white mist that hangs above it, the mowers quit their work, and troop into the low-roofed kitchen with its wide open fireplace, and tall eight-day clock ticking in one corner. Here they crowd round the deal tables; and great basins of flummery are set before them, for they all prefer that somewhat insipid dainty to bread and cheese. The farmer contents himself with overlooking his mowers, and with casting anxious glances at the sky and mountain-tops, to see if there is any possible doubt of the morrow being as fine as to-day. On Sunday he does nothing but wander round the paths of the little garden with his hands in his best trousers' pockets, whistling hymn tunes softly, and scrunching slugs under his broad flat boots. His hair is quite white, though he cannot be more than fifty. He began to get gray very early in life; and when he married, his wife, horrified at seeing how blanched his hair was getting, bought a bottle of Hair Restorer, with which she made him anoint his head before going to bed every night, for, as she said, 'They shan't say that I turned thy head white, my lad!' But as the Hair Restorer dyed her pillow-cases as well as her husband's hair, the careful wife manufactured some cotton nightcaps, in which she made the master envelop his head at night. After ten years, he at last revolved: 'Eh, lass, but I won't be bothered with this nasty stuff any more! If my head's white, let it be white.' And as there was no longer any fear of the neighbours saying that marriage had made him gray, she allowed her

good-natured giant to leave off his penance and to become suddenly white.

The wife is an active bustling body, who has worn herself to skin and bone with the energy with which she flies about the house. She is a very clever and intelligent woman too, and devours a book or newspaper with the greatest eagerness whenever she has a moment free from her manifold household duties. She has no children, and is rather proud of it than otherwise, contrasting her neat well-kept home with the squalid houses of couples who have ten or a dozen worrying children.

Slate quarries have great advantages over coal-mines in that they are clean and have no foul gases to cause explosions and sudden death; but now and then accidents, and even deaths, occur, generally caused by falls of rock from the roof, but sometimes from the carelessness of the men themselves. Only a few days ago a quarryman, in levering a great block of slate out of his bargain, neglected to stand aside in time, and so had his left arm broken. It was a comparatively trifling accident, but every man and boy left off work at once. The injured man was carried out of the tunnel and down to the engine-house, where a door was wrenched off an out-building and used as a stretcher. He was placed upon it, a friend sitting by him to support his head; and then the double burden was raised on the shoulders of a dozen sturdy giants, and borne carefully down the mountain-side, followed by the entire staff of the quarry. When they reached level ground, the bearers asked by which road he would like to be carried home. There should have been no question at all in the matter, for the lower road is three times as long as, and much more difficult than the upper; but as it has the advantage of going all round the village and passing two public-houses, it was chosen. At every step the cortège grew longer and longer, for every woman, child, and idler in the village joined; and by the time the first public-house was reached the sufferer declared that he felt faint. The good-natured landlady insisted on supplying him with some of her best old port; and when the faintness had been overcome, the procession advanced to the second public-house, where the same ceremonies were gone through; and at last, after an almost triumphal progress, the poor man was deposited in the cottage which he shared with two or three other single men, and a married man with an increasing family. Then some one thought of fetching the doctor, who, having observed the procession, was making ready to start. He was very angry when he found his patient in a high state of fever, due to the unnecessary journey that had been taken and to the wine of the generous landladies; and as a result, the arm had to remain unset until the inflammation subsided.

The evenings are generally very fine and clear up in this mountain valley; and when the night-air is not too cold, we sit out in the garden and have our after-dinner coffee under the stars. The farmer's wife has brought out a magnificent plated coffee-pot for our use, and gives us a sketch of its history. It appears it was a wedding present; but being too grand for every-day use, was put aside, and only lent now and then for

the funeral of a great friend or relation; in fact, we are the first people who have ever gone so far as to smile when using it. This is the key-note of the land: they pay more honour to the dead than to the living.

FOILED BY HIMSELF.

CHAP. II.

'HAS Mrs Crawford gone up-stairs to her room yet?' It was Mr Barnett who spoke.

'No, sir.'

'Would you tell her, please, I wish to see her here in the library?'

'Very well, sir.'

The servant departed; and in a short time Mrs Crawford made her appearance. It was now Monday evening, and on the morrow the funeral of Mr Monkton would take place. As yet, the missing will had not been found, although every likely and unlikely place had been searched, with the exception of the bookcases in the library, which Mr Barnett was now engaged in examining. He had not up to this time mentioned to any one the fact of the will having disappeared. But for alarming Miss Ashley, he would have taken her into his confidence.

'Sit down, Mrs Crawford,' he said, addressing that lady. 'Close the door, please; I do not want any one to hear what I am going to say.'

'Dear me; I hope there's nothing wrong,' said she. 'I was just thinking o' going to my bed. Miss Ashley is away up-stairs to her, and Henry Monkton to his. What was it ye were wanting?'

'I will tell you directly.—Has Miss Ashley said anything to you about Mr Monkton's will?'

'No; and I didna like to speak o' it to her, but ye'll ken all about it?'

'Henry Monkton has not spoken about it either, has he?'

'Not to me; but I couldna hae tell'd him anything about it. I dinna think he has mentioned it to Miss Ashley. He is maybe feared in case he hears that he's no to come in for anything. He'll be wanting to keep on hoping as lang's he can.'

The solicitor could not repress a smile at this last sentence. 'I will tell you why I sent for you, Mrs Crawford.—I suppose you are not particular whether you get to bed for an hour or two yet?'

'Oh, no. If ye're wanting me, I can bide up brawly.'

'I want you to give me a hand in looking through these bookcases. I have had some of the books down already. The fact is, Mrs Crawford, I can't find Mr Monkton's will; and I have searched every place that I can think of. I know he used to keep it in this room.'

'Mercy on us! The idea o' that! canna find the will! Where can it hae gane, think ye?'

'I only wish I knew. It should be produced and read at the funeral to-morrow. If I don't find it, I will have to read from the draft; but Henry Monkton will probably demand production of the principal. It will be a fortunate thing for him if it cannot be got.'

'Ay, I daresay; but we maunna let that happen. Miss Ashley is left something in it, I hope?'

'She is left everything, with the exception of some small legacies to the servants, and an annuity to his brother sufficient to keep him above want. You are remembered in it also. But if the will is not found, Henry Monkton will take everything, as his brother's sole heir.'

'Will he, the vagabond! I wad be vexed to see't. Tell me what to do and we'll begin at aince.'

'Well, we will take down these books one by one, and see if the will is not by accident between the leaves of one of them, or it may even be at the back of the bookcase.'

There was silence in the room for a considerable time while the search went on. Eleven o'clock struck. They were the only two awake in that large house. Mr Barnett was the first to speak.

'Did Henry Monkton tell you that his brother and he were on friendly terms before the death happened?' he inquired. 'He says he met him last Tuesday in town, and that they spoke to each other; but I can't believe it.'

'This is the first time I've heard o' that; but I've spoken to Henry Monkton as little as I could.'

'I asked Miss Ashley if Mr Monkton had mentioned it to her, and she said he had not. He would surely have told her if it had been the case.'

'It's as likely to be a lie as no. I wadna trust that Henry Monkton nae farer than I could see him.—But what's this inside o' this big book? It's the will, I do believe!'

Mr Barnett dropped the book he held and crossed the room to the side of Mrs Crawford. 'It is the will,' he cried joyfully.—'Thank Providence! I was afraid it was lost altogether. I ought to have had you to help me sooner, I see. You have been more fortunate than I.'

'Last Will and Testament of George Monkton, dated 5th April 1881,' read Mr Barnett from the back of the document. 'It must have got in there just as I supposed.' He opened out the will and glanced hurriedly over it, and as he did so, the expression of his face changed. 'There is some mistake here. This is not the will I meant. This one was revoked by another, executed some months later; in August, instead of April, now that I remember, but in the same year. This should have been destroyed long ago. I thought Mr Monkton had burnt it.'

'And what's the difference between that one and the other one?' asked Mrs Crawford, not a little disappointed at hearing the will found was not the one sought for.

'The legacies to you and to the servants are the same. The difference is that Miss Ashley, instead of getting the remainder, gets only one-third. His brother succeeds to the other two. This will was drawn out and signed prior to the quarrel between the brothers. The one I want was executed after that time.'

'I would be very sick sorry to see him get anything ava, much less two-thirds. We hae fand ae will at onyrate. The other may not be far aff. We'll finish what we're at, I reckon.—Is that will for nae use at a'?'

'In the event of us not finding the other, it

'will be. It contains a provision for Miss Ashley, which is one good thing. If there was no will, she would get nothing. If the other is not forthcoming, we must act on this one.'

'Do ye think Mr Monkton would ken o' that will being inside the book?'

'No; I don't think he would. That book does not seem to have been disturbed for a long time. He must have thought he had destroyed it. But yet'—The solicitor stopped short in his speech as a sudden thought struck him. 'If it be true that his brother and he had become friendly again, he may have burnt the last will, intending to make a new one; or he might be aware of the existence of this one, which would do perfectly well,' he said. 'He may have even burnt the will on the evening on which he died.—Was there any appearance, Mrs Crawford, of his having burnt any papers?'

'I heard the housekeeper say he had been burning some papers; but of course they might be some auld letters or things o' no consequence.'

'Quite possible. We will not assume that it is burnt yet, till we see.—There goes twelve o'clock. Another twenty minutes and we will have finished.—What's that?'

It was a noise like the faint creaking of a door, distinctly heard through the stillness of the house, seemingly coming from one of the rooms on the floor immediately above. Mr Barnett and Mrs Crawford both strained their ears to listen. For the space of nearly a minute they heard nothing.

'Perhaps Miss Ashley or the housekeeper looking out to see if the hall-gas is still lit, or if we are up-stairs,' Mr Barnett said. 'I hope it is not that brother spying about to see what we are after. If he had happened to be outside this door a little ago, he might have heard us talking of the will.—There it is again. Some one is certainly awake up-stairs.'

Listening intently, they now heard a slight sound, as of a footstep coming slowly down the stairs step by step. The footstep seemed too light to be that of Henry Monkton; it must be either Miss Ashley or the housekeeper, Mrs Bolding.

'They're taking their braw time, whoever it is,' said Mrs Crawford in a whisper. 'They have got to the foot of the stair now. They're coming in here.—The Lord preserve us; it's Mr Monkton himself!'

The door had opened, and a tall figure in white walked slowly into the room. Mrs Crawford, almost fainting with terror, covered down on the floor and clung to the tails of the solicitor's frock coat. Both were on the opposite side of the desk from the apparition, which advanced with noiseless tread into the centre of the room, and there paused, regarding them with a fixed stare. It held something in its right hand like a long blue packet. Mr Barnett, his blood freezing in his veins, stood literally paralysed and incapable of motion. He felt his hair rise on his head. For the space of one dread minute he actually believed that the spirit of his dead friend stood before him. Then came a wild feeling of relief as he recognised the apparition. It was not the dead man in the spirit, but his brother in the flesh, whom he beheld.

It was Henry Monkton in a fit of somnambulism.

There he stood, clad in nothing but his long night-shirt, his feet bare, his eyes wide open and unseeing, utterly unconscious of where he was or in whose presence. It was the first time in his life that Mr Barnett had beheld any one thus walking in his sleep. The sight was to him something ghostly and terrible—a sort of life in death. What was the sleeping man going to do? What was that which he held in his hand?

Mr Barnett stooped down and whispered his discovery of who the apparition was into the ear of the terrified Mrs Crawford, who speedily recovered from her fright, and both together watched the movements of the somnambulist, who seemed uncertain what to do next. First he laid down the blue packet he carried on the desk, which the solicitor now saw to be a long envelope, evidently containing something. From this envelope the sleeping man drew forth a document, which he opened out and seemed to glance over, after which he refolded and returned it to the envelope. This he laid on the desk, left it there, and walked forward to the fireplace, where he stood for a minute or two leaning against the mantel-piece, apparently wrapt in thought. Struck by a sudden thought, Mr Barnett bent across the desk, took up the envelope, drew out the document enclosed and hastily scanned it over. A single glance was sufficient. It was the missing will.

Quick as thought he snatched up the will found by Mrs Crawford, which was lying beside him, thrust it into the envelope, and slipped the newly discovered one safely into his pocket. Next he leant over and softly placed the envelope with its new enclosure back where it had lain. It was but the work of a second or two; Mrs Crawford watching him the while with bated breath, half suspecting what the envelope had contained.

The somnambulist, after standing in the same position at the fireplace for some seconds longer, returned to the desk, took up the will, went again to the fireplace and held the envelope and its contents above the now burnt-out fire, as though about to drop them into the flames which he imagined he saw. Then he turned hurriedly and glanced towards the door, put his hand containing the will behind him, as if wishing to hide it from the gaze of some one, stood for a minute in that position, and then slowly walked out of the room, closing the door behind him. Mr Barnett darted after him and followed him cautiously up-stairs. He watched him until he saw him go along the corridor and enter his room in safety; after that the solicitor returned to the room below.

'Mercy on us! Did ever any mortal see the like o' that?' This exclamation burst from the lips of Mrs Crawford as Mr Barnett rejoined her in the library. The good woman had recovered the use of her tongue, and was inclined to laugh at her recent fears. 'I really thought it was the dead man himself,' continued she. 'Eh, but he was awfu' like him, though!—What paper was that ye took? Was it the will, and had he got it after a?'

'Yes; it was the will. Here it is, safe and sound. He may do what he likes with the one he has got. I will take care this one does not fall into his hands again.'

'But how would he come to get it, think ye?'

'That is quite easily understood, Mrs Crawford. Mr Monkton must have had it beside him the night he died, and it would be lying among the loose papers on the desk. His brother, hunting amongst these papers on his arrival here, had found the will, read it; and knowing that if it were destroyed or put out of the way, he himself would be heir to everything, resolved to repress it. I remember you said he seemed a little confused when you entered the room. You had probably disturbed him while perusing the will. He has had it in his possession all along. The wonder is that he has not burnt it before this. Perhaps he could not make up his mind whether to destroy it or give it up. I can understand now his non-interference with things. He knew that the game was in his own hand.'

'It maun hae preyed on his mind to a terrible extent, though. That maun be what caused him to walk in his sleep.'

'No doubt. He seemed to be acting over again what occurred in this room when he found the will. You saw him look towards the door, as if he had heard some one coming, and then put his hand behind him, apparently to hide the will?'

'Ay, he just looked something like that when I saw him the first day standing by the fire. I'll no forget what I hae seen this night in a hurry.—Ye're sure that's the right will now?'

'Yes; there's no doubt of it this time. It is dated 5th August 1881, exactly four months to a day later than the other.'

Mr Barnett's supposition as to the manner in which Henry Monkton had got possession of the will was quite correct. He had found it on Mr Monkton's desk amongst the other papers; and after reading it was unable to make up his mind whether to destroy it or leave it somewhere where it might be found by Mr Barnett. Mrs Crawford had disturbed him in the library before he had had time to read it, hence he hastily folded it up and carried it with him to his room till he could peruse it at leisure.

Prior to his meeting with Mr Barnett in the garden, he had, after much inward discussion, determined to destroy the will; and as he knew the solicitor to be well aware of its existence, he had invented the story of having met his late brother in London, and of having become reconciled to him, in order to raise a belief in Mr Barnett's mind, when he found the will not forthcoming, that Mr Monkton might himself have destroyed it, intending to make a new one. He was made aware of his brother's visit to town on the Tuesday through an acquaintance who had met him coming from Mr Barnett's office.

About half an hour after Mr Barnett had retired to his room, Henry Monkton suddenly awoke from the deep sleep into which he had fallen, and sat up in bed, unaware that he had ever left it. His room was not quite in darkness, for a small flame suddenly shooting up from the fire, dimly lit the surroundings. The light attracted his attention.

'I have been dreaming of that cursed will again,' he muttered, thrusting his hand under his pillow to feel if the document were safe. 'Full fifty times have I resolved to destroy it, and as often something has held me back. The fire is still burning. I will be tormented no longer. This very minute it shall be consigned to the

flames; then surely I shall have peace. It is an unjust will. It should never have been made. That girl, an utter stranger, to get everything, and I nothing. Not while I live to prevent it.'

Not allowing himself one instant for reflection, he rose, and crossed the room quickly to the fireplace. The flame was still burning invitingly. By its light he read the writing on the back of the envelope, to make himself certain that it was the one containing the will, then thrust both envelope and its contents into the heart of the fire. With glittering eyes he watched the creeping flame speedily devour them. For some seconds the whole room was brilliantly illumined, and then came darkness. The incubus was removed; the will was gone for ever!

Mr Monkton's funeral was over. Dust had been consigned to dust, to await the final resurrection. The next act in the drama was the reading of the dead man's will, an event usually anxiously looked forward to by eager prospective legatees.

In the drawing-room after the funeral were assembled Mrs Crawford, Miss Ashley, Henry Monkton, Sir Andrew Dawson, Mrs Crawford's son Peter, who was a clerk in the City, and Mr Barnett. Several of the principal servants were also present. Henry Monkton, in spite of his best efforts, could not wholly conceal his agitation. Miss Ashley appeared calm and composed. She was thinking more of the kind guardian she had lost than of what he had left behind him. Mr Barnett, who had the will in his pocket, now rose to speak.

'You all know, of course, that it is customary for the will of a deceased person to be read immediately after the funeral,' he began, fixing his eyes on Henry Monkton, who quailed under their keen glance. 'But before I say more, I wish to know, supposing the principal will not to be at hand, if I may be allowed to read from the draft which I have here? Draft and principal are precisely alike in substance.'

No one spoke for some seconds. No one, indeed, had any interest to speak save Henry Monkton. Miss Ashley was no relation to the deceased, and Mrs Crawford and her son were but distant connections.

Mr Barnett was about to resume, when Henry Monkton interrupted him. 'What is the good of reading from the draft?' said he. 'We must have the will itself. Where is it? Why have you not got it?'

'These inquiries, Mr Monkton, you are probably in a better position to answer than myself. Have you no idea where your brother's will is?'

The question was put so direct that Henry Monkton lost his temper. 'What do you mean?' he said in an angry tone. 'How should I know anything about it? It is not likely I shall gain anything by it. You would take care of that while framing it, I'll bet.'

Mr Barnett, without taking notice of this innuendo, simply said: 'Then you know nothing of the will? You have not seen it?'

'No; I have not seen it, if that will satisfy you; and now, kindly proceed. I suppose the upshot of all this is that there is no will?'

'Oh, no. You are mistaken; the will is here. all right enough,' Mr Barnett said, producing it. 'But I have to thank you for its restoration, as

well as for its disappearance; I only got it last night.'

Henry Monkton, amazed and confounded at the production of the will, which he could only conclude to be a later one than that which he had burnt, had not a word to say. He was, however, at a loss to understand the last sentences uttered by Mr Barnett. 'I do not understand you,' he said at length. 'I have no connection with the will whatever. If it was ever lost, it is evidently found again. Be kind enough to leave me out of the matter altogether; I know nothing about it.'

'My friends,' said Mr Barnett, 'look at this man. He comes down here, pretending regret for the brother he has lost, and with a lying story on his lips that his brother and he, who for a very long time had not spoken to each other, had become friends again a week to-day—three days before that brother's death. He finds his brother's will in the library, reads it, and seeing that he himself is left almost nothing, and that this innocent girl here inherits everything, resolves either to destroy or conceal it. In his policy, he does not assume the mastership here; he interferes with nothing, knowing well that he can bide his time; and this for the purpose of deceiving those around him into a belief that he neither expects nor desires to gain anything by the death of his brother. He intended, no doubt, to counterfeit surprise when no will was to be found. This will which I hold in my hand is the one taken from the library by that man. Up till last night at twelve o'clock, it was in his possession, at which time it found its way into my own.'

Not one of the hearers was half so much astonished at hearing this speech as was Henry Monkton. Believing that he had burnt the will which he had found, he was amazed at what he heard. But he thought he saw an opening to prove the falsity of some part at least of the solicitor's statement.

'You will all observe,' said he, rising and gaining courage, 'that this gentleman accuses me first of stealing my brother's will, then, apparently, of restoring it again. This restoration, according to his story, would seem to have taken place last night at midnight. At that time I was in bed and asleep; he, for aught I know, was the same. I did not see him after dinner yesterday. The whole tale is a base fabrication.'

'It is true. I have a witness here.—Mrs Crawford, will you kindly tell what we both saw last night? Perhaps you will convince him.'

'Deed, I'll soon tell, and no be backward either,' said Mrs Crawford; and she proceeded to relate in detail what she had seen: the white figure entering the library; her terror when she saw, as she thought, the apparition of her dead relative; the packet which it carried in its hand; how the figure turned out after all to be Henry Monkton himself, walking in his sleep; and how Mr Barnett had succeeded in substituting the one will for the other.

The company heard the relation of the story with amazement. As for Monkton, he was simply stricken dumb. Every one in the room turned to look at him; he was pale as death. Aware that he occasionally walked in his sleep, he had no doubt of the truth of what Mrs Crawford had just narrated, or of the fact that he had

been tricked by the solicitor. He did not speak. Foiled by himself, by his own unconscious act, he slunk out of the room, and shortly after left the house.

THE EYES OF MEN OF GENIUS.

EMERSON used to say that each man carried in his eye the exact indication of his rank in the immense scale of men. Another close observer of human nature asserts that persons with prominent eyes are found to have great command of words and to be ready speakers and writers. A third holds the theory that the prevailing colour of the eyes of men of genius is gray. These preliminary statements may, we think, suffice as introduction to a slight comparative study of the eyes of some notable men of modern times. Our readers shall make the study for themselves; we, on our part, will provide a few examples from which to theorise: With the eyes of 'witching womankind' we have nothing to do in the present paper: were we but to introduce these 'leaders of men's souls'—brown, black, gray, or

With the same blue witchery as those
Of Psyche, which caught Love in his own wiles,

we should possibly get no further; like the Arab poet who, having once asserted in his song that his love had the eye of a gazelle, recurred again and again to the pleasing metaphor, and had in the end to make it the burden of a tolerably long effusion. His imagination could find room for nothing else.

Colonel Higginson mentions Nathaniel Hawthorne's 'gray eyes'; whilst Mr F. H. Underwood, 'who once studied them attentively, found them mottled gray and brown, and indescribably soft and winning.' Elsewhere, we find it asserted that 'no finer eye had appeared in the literary circles of Great Britain since Burns's time than those of Hawthorne.' Charles and Mary Cowden Clarke, describing their visit to Leigh Hunt in 1856, speak of his 'silvery hair, thin pale cheek, and wondrous eyes, which were no less beautiful in their aged aspect than they had been in their youthful one.' Dickens's eyes were characterised by Forster as 'wonderfully beaming with intellect, and running over with humour and cheerfulness'; and by Carlyle as 'clear, blue, intelligent.'

David Gray's were 'large and lustrous;' and Dante Rossetti's 'gray-blue, clear, and piercing, and characterised by that rapid penetrative gaze so noticeable in Emerson.' In one of his letters to Cottle, Southey refers to William Godwin's 'large noble eyes.' Landor's have been described as 'bold, full, blue-gray,' and as 'large and full.' In one of Carlyle's letters to Emerson, he refers to Landor as 'a tall, broad, brawny man, with gray hair, and large fierce-rolling eyes.' Emerson learned from this same source of Southey's eyes 'that seem running at full gallop;' and of old Rogers 'with these large blue eyes, cruel, sorrowful.'

James Russell Lowell's eyes 'in repose have clear, blue, and gray tones, with minute dark mottlings. In expression they are strangely indicative of his moods. When fixed upon study, or while listening to serious discourse, they are

grave and penetrating; in ordinary conversation they are bright and cheery; in moments of excitement they have a wonderful lustre.'

Shelley's eyes are always spoken of as magnificent, and fully indicative of his wayward genius. One writer describes them as 'large and animated, with a dash of wildness in them;' another speaks of them as 'such a pair of eyes as are rarely seen in a human or any other head, intensely blue, with a gentle and lambent expression, yet wonderfully alert and engrossing.' Medwin, whilst writing of Shelley's personal appearance, refers to his blue eyes, 'very large and prominent. They were at times, when he was abstracted, as he often was in contemplation, dull, and as it were insensible to external objects; at others, they flashed with the fire of intelligence.' Tom Moore's eyes were 'as dark and fine as you would wish to see under a set of vine-leaves.'

Of Coleridge it is reported: 'His forehead was prodigious—a great piece of placid marble; and his fine eyes, in which all the activity of his mind seemed to concentrate, moved under it with a sprightly ease, as if it were pastime to them to carry all that thought.' Another friend of his writes: 'The upper part of Coleridge's face was excessively fine. His eyes were large, light gray, prominent, and of liquid brilliancy, which some eyes of fine character may be observed to possess, as though the orb itself retreated to the innermost recesses of the brain.' In his *Life of Sterling*, Carlyle introduces his famous description of Coleridge's appearance. 'The deep eyes, of a light hazel, were,' he says, 'as full of sorrow as of inspiration; confused pain looked mildly from them, as in a kind of mild astonishment.'

Of Charles Lamb it has been said: 'His features were strongly yet delicately cut; he had a fine eye as well as forehead.' The eyes of Keats were described by one of his contemporaries as 'mellow and glowing; large, dark, and sensitive.' Cowden Clarke states that they were of a brown colour, or dark hazel, thus contradicting Mrs Procter's assertion that they were 'blue.' Goldsmith's were gray or hazel; they were designated by himself as 'disgustingly severe.'

'The finest eyes, in every sense of the word, which I have ever seen in a man's head (and I have seen many fine ones) are those of Thomas Carlyle.' Such is the testimony of Leigh Hunt. In a description of the 'Chelsea Sage' as a lecturer at Willis's Rooms, we find the following: 'There he stood, rugged of feature; brow abrupt like a low cliff, craggy over eyes deep-set, large, piercing, between blue and dark gray, full of rolling fire.'

Leigh Hunt, in his *Autobiography*, speaking of Wordsworth's appearance, says: 'I never beheld eyes that looked so inspired or supernatural. They were like fires half burning, half smouldering, with a sort of acrid fixture of regard, and seated at the further end of two caverns. One might imagine Ezekiel or Isaiah to have had such eyes.'

Walter Scott said of Burns: 'There was a strong expression of sense and shrewdness in all his lineaments; the eye alone, I think, indicated the poetical character and temperament. It was large, and of a cast which glowed (I say literally glowed) when he spoke with feeling or interest. I never saw such another eye in a human head,

though I have seen the most distinguished men of my time.' Another's testimony is: 'In his large dark eye the most striking index of his genius resided. It was full of mind, and would have been singularly expressive under the management of one who could employ it with more art for the purpose of expression.'

Darwin had a 'prominent forehead and over-arching brow, and keen deep-set eyes, in which resolute strength and piercing insight were indicated.'

Many other examples force themselves upon our notice; but we think our list has been sufficiently extended to show how interesting a field the subject opens up for observation and theory. It has the additional charm of having to do with human life by which we are surrounded on every hand, and in which we daily take our part and place. And the days of full eyes and heaven-born genius are not altogether things of the past.

'IN AUTUMN OF THE YEAR.'

When golden grain hath crowned the ear,
And sweet September rivals May,
In the ripe radiance of the year,
Upon this lustrous Autumn day,
To the lone moor-bound woods I fare
Ere yet the russet boughs be bare.

Within this fair and dazzling glade,
Screened from the sunbeam's stroke I rest,
And mark the gold to silver fade
When evening's glory floods the west,
Stretched in sweet ease upon the heath,
The woven forest boughs beneath.

The silver twilight sets around,
The sun sinks glimmering through the trees,
The dew's kiss chill the heath-clad ground,
And borne upon the wakening breeze,
The northern ocean's moaning drear
Breaks in dread echo on mine ear.

Mysterious harmony it makes,
This restless murmur of the sea,
And dark foreboding dreams it wakes
Of storm-blown leaf, and wind in tree,
Whispering of Winter's fateful breath,
Chill winnowed through the doors of death.

TEMPLE GHOSTS.

If it be true that the shades of the long dead hover round the places endeared to them by association with the hopes and fears of life—if the veil which rests, like that of Mokanna, over the hollow face of the spectral Past could be drawn aside for mortal gaze, few rarer fields of vision for the curious would there be than the time-honoured precincts of the Temple. And this still more so, if it were possible to see those immaterial forms of men and women who have never walked the earth in other sphere than that of fancy, and yet to us, who have learnt to know and love these creatures of poetry and fiction not less than those of history, are almost like dear friends whose hands we have often clasped or gazed into their eyes.

And yet this is no vain impossibility, nor is any etherealisation of vision needed to enjoy these entrancing scenes. The mental eye, quickened by the fire of imagination, can revel in halls of delight that the mere dull observer neither sees nor dreams of. The careless eye gazing on moonlit abbey ruins, Druidic circles, or aged moss-grown piles, sees but a useless and an ungainly heap of brick or stone, and reverts with comfortable satisfaction to the less sentimental vision of nineteenth-century villadom. Not so do sights like these affect the gaze of the thoughtful and imaginative few. To them, the roofless chancel and hoary keep are filled with shadowy forms of the dead Past, and cowed monks and belted knights and courtly dames pace the weather-beaten floors, while faint echoings of long-silent tongues strike on the crumbling walls, and scenes of life and death, of mirth and sadness, flit in vivid colours before their eyes. Truly, there are few pleasures like the pleasures of imagination! And so, reader, if you would know such pleasures as these, and feast your eyes on what is hidden from the many, come with me to-night; better in the silent night, when Sleep has stretched his mystic wand over the busy city, than in the noise and turmoil of the garish day. Hither! then,

reader, wrap thyself, Faust-like, in my magic cloak, and so, like Goethe's pair, we may traverse air and earth unfelt by human touch and unseen by peeping eye.

Out of the Fleet, now quit of its roar and bustle, as the City clocks chime the first hour of the morning—let us turn beneath the old portals of this Middle Temple archway, under whose shadows we seem to see the form of him who designed it, the architect also of the great cathedral not very far away. Down the Lane, lined with tall prim brick-built houses, redolent of the days of good Queen Anne, and see who comes here—handsome, gay, with lithesome step, and backward glance of humorous scorn, hurrying past us, doggedly pursued by another, with firm-set teeth and knitted brow, feverishly clenching his hands in impotent fury at the tantalising figure he is following. Eugene Wrayburn, most jocular of briefless juniors, is not this wanton trifling with the emotions of him thou makest thy satire's butt, unworthy of a barrister-at-law and a gentleman? Yet Bradley Headstone wearily follows, and they are lost in the mists of the night.

Entering Brick Court, stately in its very simplicity, rise with me, fellow-wanderer, into the midnight air; peer through the cracked pane of this grimy window, and tell me what thou seest. A dishevelled wight sits in a room barely furnished, except with loose paper scraps and unpaid bills, which are numerous enough, drawing out of his genius, stimulated by poverty and despair, sweet pictures of rural loveliness, now very dear to us to whom Oliver Goldsmith is a household word, and the Vicar of Wakefield and his children like old, old friends. But see! through this window above, in soberer but less threadbare attire, at a table piled with calf-bound tomes of Coke and Bracton, the erudite compiler of legal commentaries, transferring with busy quill to countless sheets what shall long be the first stepping-stone of embryo judges, and the *pons asinorum* of briefless juniors.

But let us descend in our Mephistophelean mantle, and turn towards the sombre shades of

the old Hall, and watch the fantastic scenes in the dusky interior. See! the room is filled with gay ladies, ruffed and farthingaled, courtiers and counsellors and men of letters listening to yonder figure with that calm lofty brow, which we still see sculptured over the tomb, in the little Warwickshire church that holds the ashes of this 'Imperial Caesar' of literature. Here 'sweetest Shakespeare, Fancy's child,' read to Royalty the most ethereal of all his plays; and so this picture fascinates our eyes till the figures grow dim and dissolve into another scene of mirth and beauty. Thronged grows the floor of the great Hall, animated the wit and laughter, and on all sides are courtly bows and stately courtesies and lovely forms lost in wealth of jewels; and one advances with 'clear and cold-cut face,' haughty with the haughtiness of the Tudor line, imperious with the majesty of the great realm she loved so well, and so good Queen Bess leads off the dance with the Chancellor, Sir Christopher Hatton. We gaze with awe and wonder at the faces of years long past, till the figures grow cold and lifeless and vanish as we look, and nothing is left but the cobwebs on the oaken joists, and darkness rests over all. 'We are such stuff as dreams are made on, and our little life is rounded with a sleep.'

Back into Fountain Court, where the leafy branchlets are quivering in the night-breeze, and the little fountain, the *genius loci*, tosses its incessant spray with a murmuring sound, like a voice from distant years. What sights must this same little fountain have seen, what sounds it must have heard, plashing constantly in these quiet shades! As we stand gazing, we seem to forget the hour and the darkness; the old Court grows bright with a glamour which turns its forensic sombreness into something like a smile. The sunbeams dart through the leaves of the trees; the sparrows wash their feathers free from City soot and dust, in the clear waters, while the 'little fountain sparkles in the sunshine.' We see approaching a maiden form of sweet fragile beauty, not less sweet in her Puritanic primness, blushing to raise her eyes to meet those of another form advancing from the other side. Dear little Ruth Pinch! how could the fountain help sparkling more brightly and splashing more merrily at thy presence! And John Westlock! John Westlock! staidest of London bachelors, how many weeks' purchase would Piery-face give for thy washing if she could see thee now?

We may not linger here, but pass on to the Gardens, and as we descend the steps, we think we see two familiar figures wending their way to their murky chambers. Poor 'Pip,' lost in love of Estella, and fearing for the safety of the convict benefactor who has been the unknown cause of all his 'Great Expectations,' And can we pass this other shade unnoticed? Who is it but Tommy Traddles? Not the Traddles of Gray's Inn days, harbouring in felicitous but circumscribed seclusion the whole sisterhood of 'the dearest girl in the world'; but Traddles as we last knew him, the eminent Q.C., drawing huge retainers, more numerous than the skeletons of schoolboy days. We fain would linger over the creations of that genius, but must speed our way across the velvet turf

of the Gardens, where we, with the magic aid of our cloak of Fancy, behold the angry forms of stern-faced warriors, and on our ears fall passionate words like these:

Let him that is a true-born gentleman . . .
If he suppose that I have pleaded truth,
From off this briar pluck a white rose with me;

and then others with fiercer earnestness:

Let him that is no coward, nor no flatterer,
But dare maintain the party of the truth,
Pluck a red rose from off this thorn with me.

And while the words still ring in our ears, we see before us the round stone porch of the old church, and the air seems to ring with the clang of steel. All around are sunburnt and scarred faces of red-cross knights, while from the chancel comes the sound of voices chanting the vesper hymn. Shades of brave crusaders are here, men who, perchance, have seen the giant axe of the Lion-hearted king cleave many a Saracen skull; or who have struck a blow for the Holy Sepulchre at Acre or Askalon. Some maybe have fought under the perjured Brian de Bois-Guilbert, and seen the Black Knight charge for the Jewish maiden. But in an instant they are gone, 'vanished into air, into thin air;' and clear and cold in the darkness stands out the old church, where these and many more were laid in their long home centuries ago. Now

Their swords are rust,
Their bones are dust,
Their souls are with the saints, we trust.

Nor are these the only forms that haunt these consecrated walls. Near here, 'Elia' must have lived some part of that weary witty life, thinking out, possibly, those beautiful Essays which have rendered the name of Charles Lamb immortal. Near here, Boswell must often have walked with the ponderous Doctor before adjourning to the *Cock Tavern*, hard by—now, alas! like its former neighbour, Temple Bar, fallen into the hands of the destroying Vandals—for gossip with the geniuses that gathered there. Not far away, too, Pendennis must have lain sick in his attic chambers, tended by loving hands; and poor little Fanny Bolton have wept her heart out at the loss of her adorer; and pensive Laura and her guardian have watched through long hours the sleepless tossings of their loved one. What slashing criticisms of aspiring authors must have emanated from the pen of the precocious young reviewer in those dreary rooms! Hard by, also, must Clive Newcome more than once have entertained the dear old Colonel; 'Philip' undoubtedly have had some of those character-forming 'Adventures,' and Mr Timmins have received that parliamentary brief out of which sprang the 'little dinner-party;' and finally, there, in Hare Court, lived the deep-hearted creator of them all.

And still other shadows of a distant Past throng around us—whole airy legions of riotous law students pollicking home from Alsatian brawls, initiating into the mysteries of London dissipation innocent young gallants like Nigel Olifaunt, who have come to seek, or quite as often to lose, their fortunes in the Metropolis.

We could linger long on thoughts and scenes like these; but the prosaic shriek of some belated

river-bont calls us too hastily back to the nineteenth century.

With a start, we wake from our reveries, and remember that, after all, we have only been gazing on pictures of Fancy's painting; and so, with a sigh, we return once more to what, with Herr Teufelsdröckh, we vow to be 'this poor hampered, miserable, despicable Actual.'

A DEAD RECKONING.

CHAPTER II.

FIVE minutes might have passed when Gerald Brooke and the Baron Von Rosenberg came sauntering along the terrace, and entered the room through one of the long windows.

In appearance the owner of Beechley Towers was a thoroughgoing Englishman, and no one would have suspected him of having a drop of foreign blood in his veins. He was six-and-twenty years old, tall, fair, and stalwart. His hair, beard, and moustache were of a light reddish brown; he had laughing eyes of the darkest blue, and a mouth that was rarely without a smile. His bearing was that of a well-born, chivalrous, young Englishman. As he came into the room, laughing and talking to the Baron, he looked like a man who had not a care in the world.

The Baron Von Rosenberg was so carefully preserved and so elaborately got up, that one might guess his age at anything between forty and fifty-five. He was tall and thin, with a military uprightness and precision of bearing. He had close-cropped iron-gray hair, and a heavy moustache of the same colour. He spoke excellent English with only the faintest possible accent, but with a certain slowness and an elaboration of each word, which of themselves would have been enough to indicate that he was not 'to the manner born.'

'I had no idea, my dear Brooke, that you were such a crack shot,' remarked the Baron. 'I had made up my mind that I should have an easy victory.'

'I learned to shoot in Poland, when I was quite a youngster. It is an amusement that has served to while away many idle hours.'

'I have a tolerable range at Beaulieu; you must come over and try your skill there.'

'I shall be most pleased to do so.'

'I have also a small collection of *curios*, chiefly in the way of arms and armour, picked up in the course of my travels, which it may amuse you to look over.'

'Your telling me that,' answered Gerald, 'reminds me that I have in my possession one article which, as I believe you are a connoisseur in such matters, you may be interested in examining.' As he spoke he crossed to a cabinet, and opening the glass doors, he brought out a pistol, the barrel and lock of which were chased and damascened in gold, and the stock ornamented with trophies and scrolls in silver inlay and repoussé work. 'It was given me when I was in India by a certain

Nawab to whom I had rendered some slight service,' said Gerald as he handed the pistol to the Baron. 'It doesn't seem much of a curiosity to look at; but I am told that in its way it is almost unique.'

'I can readily believe that,' answered the Baron, as he examined the weapon minutely through his gold-rimmed glasses. 'I have never seen anything quite like it, although I have seen many curious pistols in my time. I myself have two or three in my collection on which I set some little store. I call to mind, however, that a certain friend of mine in London, who is even more *entêté* in such matters than I am, owns a weapon somewhat similar to this, inlaid with arabesque work in brass and silver, which he has always looked upon as being of Spanish, or at least of Moorish workmanship.—Now, my dear Mr Brooke, I am going to ask you the favour of lending me this treasure for a few days. I go to London to-morrow, and while there, I should like to show it to my friend, so as to enable him to compare it with the one in his possession. He would be delighted, I know, and'——

'My dear Baron, not another word,' cried Gerald. 'Take the thing, and keep it as long as you like. I value it only as a memento of some pleasant days spent many thousands of miles from here. My servant shall carry it across to Beaulieu in the course of the evening.'

'A thousand thanks; but I value the weapon too highly to trust it into the hands of a servant. I will return it personally in the course of a few days.' So saying, the Baron, with a nod and a smile, dropped the pistol into the pocket of his loose morning coat.

'But what of your wife,' he said presently; 'may I not hope to have the pleasure of seeing her again before I take my leave?'

Gerald crossed the room, and was on the point of ringing the bell, when Mrs Brooke entered.

The Baron's heels came together as he bent his head. 'I was just about to take my leave, madame,' he said. 'I am overjoyed to have the felicity of seeing you again before doing so.'

There was something too high-flown about this for Clara's simple tastes, and her cheek flushed a little as she answered: 'I hope you have enjoyed your pistol-practice, Baron.'

'Greatly. I assure you that Mr Brooke is an adept with the weapon—very much so indeed. I must really beg of him to give me a few lessons.'

Gerald laughed.

'As a diplomatist by profession, Baron, you are doubtless a proficient in the art of flattery,' said Mrs Brooke.

'A mere tyro, dear madame. Sincerity is the badge of all our tribe, as every one knows.'

At this they all laughed a little.

'But now I must positively say adieu.'

'By which road do you return to Beaulieu, Baron?' inquired Gerald.

'The afternoon is so fine and the distance so

short, that I purpose walking back through the park.'

'Then, with your permission, I will walk with you as far as the corner of the wood.'

'Need I say that I shall be charmed?'

Mrs Brooke gave the Baron her hand. He bent low over it. For once the ramrod in his back found that it had a hinge in it.

'You will not be gone long?' said Clara to her husband.

'Not more than half an hour.—We will go this way, Baron, if you please.'

'Are all diplomatists like the Baron Von Rosenberg, I wonder?' mused Mrs Brooke. 'If so, I am glad Gerald is not one. His politeness is so excessive that it makes one doubt whether there is anything genuine at the back of it. And then the cold-blooded way in which he looks you through out of his frosty eyes! Could any woman ever learn to love a man like the Baron? I am quite sure that I could not.'

She seated herself at the piano, and had been playing for a few minutes when she was startled by the sound of footsteps on the gravel outside. She turned her head and next moment started to her feet. 'George! You!' she exclaimed; and as she did so, the colour fled from her cheeks and her hand went up quickly to her heart.

At Mrs Brooke's exclamation, a tall, thin, olive-complexioned young man, with black eyes and hair and a small silky moustache, advanced into the room. He was handsome as far as features went; just now, however, his expression was anything but a pleasant one. A something that was at once furtive and cruel lurked in the corners of his eyes, and although his thin lips were curved into a smile, it was a smile that had neither mirth nor good-nature in it. A small gash in his upper lip, the result of an accident in youth, through which one of his teeth gleamed sharp and white, did not add to the attractiveness of his appearance. In one hand he carried a riding-whip, and in the other a pair of buckskin gloves.

'Good afternoon, Clara,' he said with a careless nod as he deposited his hat, gloves, and whip on the side-table.

'You quite startled me,' said Mrs Brooke as she went forward and gave him her hand.

'You expected any one rather than me—of course. As I was riding along the old familiar road, I saw your husband, in company with some other man, walking down the avenue. In the hope that I might perhaps find you alone, I rode on to the *Beechley Arms*, left my horse there, entered the park by the side-entrance that you and I know so well, and here I am.'

'I am very glad to see you.'—Mr George Crofton shrugged his shoulders.—'Why have you not called before now? Gerald has often wondered why we have seen nothing of you since our return from abroad.'

'How kind, how thoughtful, of my dear cousin Gerald!' This was said with an unmistakable sneer.

'George!'

'Clara.'

'You are not like yourself to-day.'

'Look you, Clara—if you expect me to come here like an every-day visitor, to congratulate you on your marriage, you are mistaken. How is it possible for me to congratulate you?—and if I

were to say that I wished you much happiness, it would be—well—a lie!'

'This from you?'

He drew a step nearer, flinging out his clenched hand with a quick passionate gesture. 'Listen, Clara. You and I have known each other from childhood. As boy and girl we played together; when we grew older we walked and rode out together; and after you left school we met at balls, at parties, at picnics, and if a week passed without our seeing each other we thought that something must have happened. During all those years I loved you—ay, as no other man will ever love you—and you, being of the sex you are, could not fail to see it. But your father was poor, while I was entirely dependent on my uncle; so time went on, and I hesitated to speak. But a day came when I could keep silence no longer; I told you everything, and—you rejected me. If I had been wild and reckless before, I became ten times more wild and reckless then. If before that day I had offended my uncle, I offended him beyond all hope of forgiveness afterwards. But before I spoke to you, my irresistible cousin had appeared on the scene and had made your acquaintance. Your woman's wit told you that his star was in the ascendant, while mine was sinking. Pshaw! what need for another word. It is barely eighteen months since you and he first met, and now you are the mistress of Beechley Towers, while I am—what I am!'

It was with very varied emotions that Mrs Brooke listened to this passionate outburst. When it came to an end she said in her iciest tones: 'Was it to tell me this that you came here to-day?'

'It was.'

'Then you had much better have stayed away. You do not know how deeply you have grieved me.'

'I have told you nothing but the bitter truth.'

'The truth, perhaps, as seen through your own distorted vision. From childhood you were to me as a dear playmate and friend, and as a friend I have regarded you till to-day.'

'A friend! Something more than friendship was needed by me.'

'That something would never have been yours.'

'I will not believe it. Had not a rival crossed my path—a rival who wormed his way into my uncle's affections, who ousted me from the position that ought to have been mine, who is master here to-day where I ought to be master—had he never appeared, a love so strong and deep as mine must have prevailed in the end!'

'Never, George Crofton, as far as I am concerned! You deceive yourself utterly. You!—She came to a sudden pause. A servant had entered, carrying a card on a salver. Mrs Brooke took the card and read, 'M. Paul Karovsky.—I never remember hearing the name before,' she remarked to herself. Then aloud to the servant: 'Where is the gentleman?'

'In the small drawing-room, ma'am. He said that he wanted to see Mr Brooke on particular business.'

'Your master is out at present; but I will see Monsieur Karovsky myself.'

Turning to Crofton as soon as the servant had left the room, she said: 'You will excuse me for a few moments, will you not? Gerald will be

back in a little while, and I do so wish you would stay and meet him. George"—offering him her hand with a sudden gracious impulse—"let this afternoon be blotted from the memory of both of us. You will never say such foolish things to me again, will you?"

He took her proffered hand sullenly enough. 'I have said my say,' he muttered with averted eyes; with that he dropped her fingers and turned away.

A pained expression flitted across her face as she looked at him. 'You will wait here till I come back, will you not?' she said; and then, without waiting for an answer, she quitted the room.

With his hands behind his back and his eyes bent on the ground, George Crofton paced the room once or twice in silence. Then he said, speaking aloud, as he had a trick of doing when alone: 'It is a lie to say she would never have learned to love me! She may try to deceive herself by saying so; but she cannot deceive me. Had not my smooth-tongued cousin come between us, she would have been mine. I had no rival but him. Not only has he robbed me of the woman I loved, but of this old house and all this fair domain, which would all have been my own, had he not come between my uncle and me, and made the old man's bitterness against me bitterer still. 'Oh,' he exclaimed bitterly, 'I have every reason for loving my dear cousin Gerald!'

Presently he caught sight of the miniature of his cousin where it hung above the davenport. 'His likeness!' he exclaimed. 'The original is not enough for her; she must have this to gaze on when he is not by.' He took the miniature off the nail on which it hung and scanned it frowningly. 'To think that only this man's life stands between me and fortune—only this one life!' he said. 'Were Gerald Brooke to die without heirs, I—even I, his graceless scamp of a cousin—would come into possession of Beechley Towers and six thousand a year! Only this one life!' He let the miniature drop on the hearth, and then ground it to fragments savagely under his heel. 'If I could but serve the original as I serve this!' he muttered.

The sound of the shutting of a distant door startled him. He pressed his hands to his forehead for a moment, as though awaking from a confused dream; then he sighed deeply and took up his hat, gloves, and whip. 'Adieu, Clara; but we shall meet again,' he said aloud. With that he put on his hat and buttoned his coat and walked slowly out by the way he had come.

Two minutes later Mrs Brooke re-entered the room. She looked round in surprise. 'George gone?' she said to herself. 'Why did he not wait and see Gerald?' She crossed to the window and looked out. 'Yes; there he goes striding through the grass, and evidently not in the most amiable of humours. How strangely he has altered during the last three or four years; how different he is now from what he used to be when we were play-mates together! If he had but some profession—something to occupy his mind—he would be far happier than he is. But George is not one to love work of any kind.' With that Clara looked at her watch and dismissed Mr Crofton from her thoughts. 'I wish Gerald were back. What can that strange Monsieur Karovsky want with him? What can be the business of importance that has

brought him here? I feel as if some misfortune were impending. Such happiness as mine is too perfect to last.'

She was crossing the room in search of a book, when her eye was attracted by the fragments of the miniature on the hearth. She was on her knees in a moment. 'What is this?' she cried. 'Gerald's likeness, and trodden under foot! This is George's doing. Oh, cruel, cruel! What a mean and paltry revenge! It is the portrait Gerald gave me before we were married. I could never like another as I liked this one. Oh, how mean! Gerald must not know—at least not for the present.' Tears of mingled anger and sorrow stood in her eyes as she picked up the fragments and locked them away in her desk. She had scarcely accomplished this when she heard her husband's footsteps. She hastily brushed her tears away and turned to greet him with a smile. 'And this is what you call being half-an-hour away!' she said as he drew her to him and kissed her.

'Von Rosenberg and I were busy talking. We had got half-way through the wood before I called to mind where I was.' He sat down and fanned himself with his soft felt hat. 'He tells me,' went on Gerald, 'that he has taken Beaulieu for twelve months—furnished, of course—so that we are likely to be neighbours for some time to come.'

'He must find English country-life very tame and unexciting after being used to Berlin and St Petersburg.'

'You may add, to Paris also. Some years ago he was attached to the German Embassy there.'

'To live as he is now living must seem like exile to such a man.'

'I am afraid it is little better. But the whisper goes that he is really exiled for a time—that he has contrived in some way to incur the displeasure of the powers that be, and that leave has been given him to travel for the benefit of his health.'

'Poor Baron! Let us hope that his eclipse will only be a temporary one.—By-the-bye, there has been some one else to see you while you have been out.'

'And they call this the seclusion of the country!'

'Some Russian or Polish acquaintance whom you probably met when abroad.'

'Ah! His name?'

'Monsieur Karovsky.'

Gerald Brooke drew in his breath with a gasp. 'Karovsky—and here!'

'He says that he has important business to see you upon.'

'He is one of the few men whose faces I hoped never to see again. Where is he?' There was trouble in his eyes, trouble in his voice, as he asked the question.

'When I told him that you were out, he said that, with my permission, he would smoke a cigarette in the grounds while awaiting your return. What a strange, almost sinister-looking man he is! How I wish he had stayed away!'

Her husband did not reply; he looked as if he had not heard what she said.

Next moment Mrs Brooke started to her feet. 'There he is. There is Monsieur Karovsky,' she cried.

And there, indeed, he was, standing just outside

the open window smoking a cigarette. Perceiving that he was seen, he flung away his cigarette, stepped slowly into the room, removed his hat, and bowed.

GEOGRAPHICAL ALLUSIONS IN COMMON USE.

WORDS, the instruments by which communication of thought between man and man is conducted, have frequently been compared to the coins which serve so similar a purpose in the transference of wealth; and the simile is not inappropriate, for the majority of the words which form our language bore, we doubt not, at their rise the impress of some mark which would have revealed their origin, had not time and change contributed to its obliteration. And as coins continue to pass in currency even when battered and defaced, so words often remain in use after change of form and meaning has rendered their recognition almost impossible.

If by some process of thought or some exercise of will we could make ourselves acquainted with the vicissitudes which every gold, silver, or copper coin which passes through our hands has undergone from the day when it issued bright and new from Her Majesty's Mint to the time when, worn away by the touch of many hands, it is withdrawn from circulation, what new insight into human nature, what new depths of sympathy should we acquire! And in the same manner if every word which we employ could as plainly divulge to us its origin and the shades of meaning which make up its history, how largely would our stock of general knowledge be increased!

We would endeavour briefly to collect together a few words which bear the impress of a geographical derivation—names of natural products and of manufactured goods which are called after the countries or cities whence they were first obtained. The animal, vegetable, and mineral kingdoms can each adduce examples to swell the list. The animal world is perhaps the least prolific in such instances of nomenclature, from the fact that animals are the least common articles of exportation, and, as a general rule, flourish only in the climates of which they are natives. Some birds, however, occur to our mind. The name of the *canary*, the little songster which gladdens our nurseries by its cheerful notes, points us to its original home, the islands off the western coast of Africa, whence its first emigrant ancestor was brought to England some three centuries ago. It is remarkable, however, that the brilliant yellow plumage, from which we derive a word distinctive of its delicate colour, is a result of domestic breeding, and is not found among the wild birds of the Fortunate Islands. Our gaily plumaged *pheasants* transport our minds to the eastern shores of the Black Sea, where the river Phasis (now called the Rioni) gave its name to the winged natives of the district which it watered. And when we pass into our farmyards, the strutting little *bantam* reminds us of the province in the far-off island of Java, once a debatable possession between Dutch and English; and the *turkey*—Well! mistakes will occur in the most carefully traced human genealogies, and our feathered friends are not always more fortunate. Somehow it has

happened that this naturalised American has become ticketed among us as if it came from Eastern Europe; while exactly the same error is seen in the French '*Coq d'Inde*.'

Of the numerous names of plants and fruits which enter into our subject we need but mention as typical examples, *cherry*, from the city Cerasus, in a northern province of Asia Minor, whence the tree was first brought to Italy; *damson*, the *Dunascene pluin*; *currants*, believed to have been derived from the city of Corinth, on the authority of a line of Juvenal; *indigo*, the *Indien dye*, from the growth of the plant in India; and *tobacco*, the honour of naming which is claimed by no fewer than three distinct places: Tabacco, a province of Yucatan; the Caribbean island of Tobago; and Tobasco, in the Gulf of Florida. The first-named district can perhaps produce the strongest evidence in support of its contention.

Mineral products which take their names from the places where they were first discovered are not much more rare. *Magnet* and *lodestone* are severally deducible from Magnesia and the ancient province of Lydia in which it was situated. *Alabaster* took its name from Alabastron in Upper Egypt, where it abounded; even as many precious stones, *chalcidony*, *agate*, *sardius*, and the like betray in their names the places whose soil they once enriched.

But still more interesting than these easily multiplied traces of the natural products of places of ancient and modern fame are the instances of geographically derived names of manufactured goods. Were it possible to make out a complete list of all these articles, we venture to think it might afford some slight consolation to those whose minds are exercised by one of the many puzzles of political economy, that is, the rival claims of British industry and of foreign importation. By this means alone—and it affords, we must recollect, but a view of an infinitesimal part of the subject—we may to some extent realise how many articles in common use, now staple productions of British manufacture, were in earlier days imported from other countries. Take, for example, the fabric which is perhaps most largely used throughout the world for wearing apparel, *calico*. It takes its name from Calicut, an Indian kingdom on the coast of Malabar, and was first brought to England by East India Company traders in 1631. The art of weaving this cloth had been practised in the East for centuries, calico-printing even had been long carried on in a somewhat primitive fashion, but it was unknown in this country till the seventeenth century. In 1676 this manufacture was carried on to a small extent in the south of England; some sixty years later it was established on a considerable footing in Glasgow and the west of Scotland; in 1764 it became a branch of Lancashire industry. We need not dilate on its importance at the present date, the thousands of hands to which it gives employment, the thousands of mouths which are by its means supplied with bread. We will but mention, as giving some idea of the magnitude of the calico trade, the fact that, in 1874, the calicoes exported from the British Isles were of a value considerably exceeding nineteen millions. Of the other materials of dress which we will briefly mention not a few might tell a similar tale. *Dimity* no longer hails only from Damietta;

and the word *damask* is applied to less gorgeous fabrics than those which issued from Damascus to satisfy oriental ideas of magnificence. *Muslins* came first from Mosul, *nankeen* from the city of Nanking, in China. *Cashmere* bespeaks still more unmistakably its own origin. *Holland* brings our thoughts nearer home; while *cambric* came originally, and we believe comes still, from the French town of Cambrai. More than once during the last century was the jealousy felt by English manufacturers of their more immediate neighbours and rivals in commerce, expressed by the prohibition or restriction of the importation of this fine linen fabric. Space forbids that we should increase the list of industries relating to dress materials further than by recalling the little Norfolk town where *worsted* was extensively spun at an early date.

Before passing altogether from the subject of clothing, we must also give to the Italian city of Milan the credit of giving us the word *milliner*. It points to a time when the capital of Lombardy 'gave the law to Europe in all matters of taste, dress, and elegance.' The now almost obsolete *mantua*-maker would seem to claim for another town, not far distant, some share of this honour, which Paris now monopolises.

Other traces of our indebtedness to foreign commerce are not difficult to find. The word *parchment* may be traced back through its Latin form to Pergamos, a city in that province of Asia Minor which has been so prolific in giving geographical names. This derivation is possessed of a peculiar interest as an illustration of the familiar proverb, 'Necessity is the mother of Invention.' The Egyptian papyrus had long been the staple writing-material, but when Ptolemy prohibited its exportation, the ingenious inhabitants of Pergamos devised this substitute for the continuation of their famous library. The name of one of the largest Eastern states, and one of the most advanced for many centuries in every branch of science and practical knowledge—that is, China—adheres with a strange pertinacity to every kind of porcelain. The connoisseur may speak glibly of *Delft*, of *Majolica*, of old *Chelsea*, and many another variety, but to each and all of them, even as to the commonest stoneware, he applies, despite its incongruity and contradiction, the generic name of *China*. The celebrity of Chinese porcelain in ancient days must account for this verbal absurdity. If we may credit their own annals, the ceramic art was not unknown to the Chinese 2697 B.C. Be this as it may—and the inquiry certainly does not concern us by any relation to the English language—Chinese porcelain was very early famous; and each dynasty of kings vied with its predecessors in introducing new and improved colours and decorations. In process of time its fame, and at a later date its manufacture, spread westwards. The neighbouring country of Japan gives us a name for the mode of decorative varnishing which is practised in boxes, trays, &c. of Japanese manufacture, as also on many articles which come into the market from no greater distance than Birmingham or Wolverhampton.

Two coins next occur to us. The now extinct *guineas* took their title from the district on the western coast of Africa whence was procured the precious metal of which, in 1673, they were first coined. It is alleged that the gold thus employed

was the spoil of a rich prize taken from the Dutch traders by the renowned Admiral Holmes. The first issues of guineas bore the impression of an elephant to denote their African origin. In a less questionable manner do we derive the name of our *florins* from an early coinage of the Florentine mint. Of weapons also, two may fitly enter into our category. The *pistol* betrays in its name its Italian origin from the northern town of Pistoja, still famous for the manufacture of fire-arms. Bayonne claims the distinction of first manufacturing the *bayonet* in the seventeenth century. Others, however, trace the name to the spontaneous invention of the Basque peasantry of La Bayonnette, a lower ridge of the Pyrenees, in a battle with the Spaniards. These hardy mountaineers, running short of powder, devised the expedient of fastening their long knives to the ends of their muskets, and thus equipped, they charged the astonished enemy with a successful issue.

Against the use of our concluding word we would recommend the midland counties of England to enter a protest. *Brunnagem*, in its application to worthless or inferior articles made in imitation of more valuable commodities, is an unworthy monument to remain in our language to the great town of Birmingham. Cheap toys, jewelry, and ornaments do indeed issue from her factories, and electro-plating forms an important trade, but it is metal-working in its more important branches which makes Birmingham's fame. Well has it been said by a modern writer: 'She [Birmingham] haunts us from the cradle to the grave. She supplies us with the spoon that first brings our infant lips into acquaintance with pap; and she supplies the dismal furniture which is affixed to our coffins. At home or abroad, sleeping or waking, walking or riding, in a carriage or upon a railway or steamboat, we cannot escape reminiscences of Birmingham.' It is a hard fact which makes the travesty of the name of this town which thus supplies our needs a synonym for 'cheap imitations.'

Numerous other examples of geographical nomenclature might be cited, but we place these instances before our readers as samples only of an indissoluble connection between 'local habitation and a name.'

JOHN VALE'S GUARDIAN.

CHAPTER XXXIX.

THE key turned in the lock, and Cecilia stood in the half-light, with swollen eyes and tearful face and disordered hair, like a blurred picture. Mrs Winter, conscious of old social differences, but emboldened by the bonnet, embraced her on the spot; and the girl clung to her piteously with fresh tears, not as yet knowing the meaning of her visit, but scenting sympathy and friendship.

'Now, you won't cry no more, my love,' said Mrs Winter, wiping her own eyes and turning the key in the lock. 'I can tell you one thing, my dear, as ought to do your heart good. Young Mr Jousserong, up at our house, is in such a state o' mind that I'm sure as Isaiah's more than half afraid of him. As for this 'ere marriage as

your father talks on, it'd be no less than a sinful crime to carry it through. And all the fathers in the world, my dear, might talk from now till Judgment Day, but they'd never meek it law as a gell could give her hand where her heart could never be. Why, my dear, if you was to drop a line to the vicar, or, for the matter o' that, if I was to do it, do you think as he'd cry the bands in church next Sunday? Not he. I can tell you a thing or two about Robert Snelling, my dear, as'ud never let you marry the man, not if every hair of his head was hung wi' diamonds. He's as cantankerous and contrariseous as he's high, my dear, and that ain't sayin' a little, for he's the tallest man in the parish. He's got that notions of himself as he might be Lord Barfield or the Pope o' Rome and yet be no prouder. There's nothin' satisfies the man; and to think o' throwin' away a pretty blossom like you, my dear, on such a rubbish-heap as that meks me sick to think about it. Never you fear, my darlin'; theer's them about as'll take care o' you.'

'I wo—won't marry Mr Snelling,' sobbed Cecilia; 'I'll die first.'

'Highly-tighty!' said Mrs Winter, 'who's a-talkin' about dyin'? We'll marry our own sweet-heart first, that's what we'll do, won't we?—You listen to me, my dear. I'm a old experienced woman, and I can talk to you. You let Mr Jousserong do what young Squire Tamant did when he ran away with Miss Featherstone. Her father was agin the match, and he wanted her to marry a lord, as was older than he was, though you'd hardly believe it, and had led a dreadful life; and the young Squire he went up to London, and he paid a hundred pound for a special license at Doctors' Commons; and he came down with it in his pocket; and he married the lady at ten o'clock in the mornin' the very day afore the old lord was to have wedded her. He killed her with his wild ways afterwards, and ran through her fortune in three years; but that's how he got over old Featherstone and married the girl of his heart.'

To this consolatory and hopeful narrative, Cecilia gave attentive ear. She seemed to see a spark of hope in it; and yet desperate as her affairs looked, she was hardly prepared to defy her father in that way. 'I don't know what to do,' she said helplessly. 'I only know that I'll never marry Mr Snelling.'

'Come, my darlin', urged Mrs Winter, 'you're fond of Mr Jousserong, ain't you? I'm sure he's as pretty a figure of a man for a little un as you'd see anywhere. He's got a good round lump at the bank, as I know from Isaiah, and as good a livin', seemingly, in them clever fingers o' his as if he owned land and houses. Now come, my dear, tell me, ain't you fond of Mr Jousserong?'

It took a great deal of persuasion to draw out the truth. Cecilia confessed at first that she liked Achille, and then acknowledged that she liked him very much indeed. Finally, by dint of some art and much persistence, Mrs Winter elicited the statement that Cecilia would never, never, never marry anybody else.

'Now, my dear,' said Mrs Winter, when this result was attained, 'will you let the young man do his best to help you out of this sore trouble?'

I'm sure he's got the willin' heart to do it. You could know that only by lookin' at him, at least a old discernin' woman like myself can. Now, will you, my dear, just say "Yes" to that? Will you tek what help your friends and your sweet-heart can give you?'

Perhaps if Jousserau had been there to plead his own cause, the affirmative answer might have come more easily than it did; as it was, it came at last, but only after an infinity of persuasion.

'Theer's a love,' said Mrs Winter approvingly. '—Now, dry them pretty eyes, and Flit away, sorrow, for love comes now.'

Right at the finish of this scene of consolation, the Roman Father came home again, and standing at the foot of the stairs, roared for Cecilia in a tone of noisy bantering good-humour.

The girl clung to her new-found ally. 'Here's father! What shall we do? He'll know that you are here.'

'Oh yes, my dear,' said Mrs Winter, with a prophetic little shiver, 'he'll know I'm here. I'll let him know that this instant minute.' Therewith, in rustling silks, she sailed undaunted to the door, and from the landing her voice sailed before her satirically shrill. 'What d'ye want, to beller at the gell i' thatin' for?'

For the moment the farmer stood aghast at these unexpected accents; but by the time his daughter's champion had descended, he had recovered himself; the wonderful bonnet gave him a chance at once. 'Bess o' Bedlam's fine to-day,' he said, as a greeting to his visitor. The lady's voice had conveyed a challenge, and he was not slow to accept it.

Mrs Isaiah, forgetful of the black silk gown, planted her knuckles on her hips and faced him with arms akimbo. 'I wonder you ain't ashamed,' she began, 'to look a decent woman i' the face.'

'Fetch one in and try,' he responded with ready impoliteness.

But for this, there would have been an immediate outburst of oratory; but the retort was so swift, sudden, and unexpected, that the good woman was checked in the very beginning of her flight.

'You've heerd the news?' said Shorthouse, with a sardonic grin. 'All right. I know what ye think about it, and you can save yourself the trouble o' talkin'. If I'd got a jaw as slack-hung as a female's, I could say it all myself as well as thee couldst. If I might tek the liberty o' saying so, mum, you're one o' that family o' poultry as does the cackling for other hens' eggs. You've been known for that this thirty ear.'

'I'm not one o' them,' retorted Mrs Winter, 'as puts their fingers into other folk's pies.'

'"I'm honest, quoth Tom Pickpocket," responded the farmer.

'But this I will say,' pursued Mrs Winter, ignoring the interruption, 'that I never met such a gallus ode fool as you be in all my born days. My Isaiah called o' the parish clerk this mornin', and heard what you and Bob Snelling had done between you.—Oh! you can pretend to tek it easy'—for the farmer had taken down his Broseley and was filling it with an air of philosophic reflection—'but naither you nor no man can afford to forget what his neighbours think about him. The wull parish'll cry "Fie" upon you. You've got a name a'ready to be a bitter hard un; but I

ain't afraid on you, and I'm glad to be the first to speak my mind.'

'Dear me!' said Shorthouse, pulling at his pipe and throwing one leg comfortably across the other, 'how this does remind me of old times! I could almost think as my missis was alive agen.'

'You're treatin' your child,' cried Mrs Winter, 'wuss than the beasts of the field. You're a-passin' your own flesh through the fire unto Moloch, that's what you're a-doin'.'

'Look here,' said Shorthouse; 'you go and spend your spite agen the chap as sacked your man, elsewhere. I've got nothing agen Isaiah, if he hadn't married you; and bein' a widderer myself, I can afford to pity him.'

'Pity!' cried Mrs Winter; 'it ain't under your skin. You've got the prettiest gell i' the parish somehow or other—though it's no thanks to your beauty, to be sure—and you want to throw her away on a man as is old enough to be her father; and a contrarier heart can't be found in six parishes. D'ye think as the vicar'll cry the bands if I was to speak a word to him; and I will, mind you. Have your wicked way, you shan't, Dan'l Shorthouse.'

'Tek yours, my good woman,' the farmer answered—'tek it quick, and stop on it. It'll never cross mine, with my good-will. I've always thought well of Solomon's family wisdom, but never so well as now. You go home and read what he's got to say about the contentious woman.'

'You quote Scriptor, you villain!' cried Mrs Winter, goaded to an almost wordless wrath by the farmer's constant victory. 'I've no patience with you.'

'That's what I used to think when my father give me a-hidin'. You ain't expected to have any patience, missis. If you've got common-sense left enough to find your way, go and seek it.'

Mrs Winter retired, vanquished, and yet victorious. The plot was laid already, the insolent, cruel farmer undermined, and she had spoken not a word about it. Once or twice she had been sorely tempted openly to prophesy disaster to his plans, but she had resisted the temptation.

The conversation the good lady reported at home bore but little resemblance to that which had really taken place, for before she reached her husband's door, she had found a perfect response to each of the farmer's seemingly unanswerable satires, and had quite convinced herself of the truth of her own version. She poured it all out upon Isaiah, who laughed, and took pride in her verbal smartness; and Jousserau descending, joined in the laughter, anxious as he was.

'If you're ready, Mr Jousserong,' she said, 'Cecilia's willin'. It took a mighty heap o' trouble to drag it out of her; but if you'll go to London and get a special license, he'll marry you, if nothing better can be done.'

The artist expressed his readiness to do anything to rescue his love from a fate so terrible as that which threatened her. Banking hours were over, and there was no drawing the money that night; but here Isaiah came to the fore, and offered manfully to cash his lodger's cheque for two hundred pounds upon the spot. He volunteered, moreover, to put the pair of steppers into the brake and drive Jousserau to the railway station.

Jousserau scrawled his cheque, and ran up-stairs to dress and pack. When he descended again, the money lay already in gold and notes upon the table; and Isaiah was outside, hurrying on the preparations for the drive. Their way led them past the farmer's house; and Cecilia, hearing the sound of wheels, peeped out of window, and saw her knight flying away to find arms for her deliverance. Jousserau kissed his hand to her as he was borne swiftly by, and she responded to his farewell in a like fashion and shrank blushing behind the curtain.

CHAPTER XL.

About noon on the following day, young John, accompanied by his *fidus Achates*, rushed up to Isaiah's house and with great *empressement* demanded to see Mr Jousserau.

'Mr Jousserong's gone to London, my lad,' said Isaiah, who himself answered the summons of the boys. 'He can't be back afore nightfall, if he gets back then.'

At this the two visitors stared at each other with faces so ludicrously crestfallen and wondering, that Isaiah was moved to ask what was the matter.

'Why,' said John, 'it's Madame Vigne's birthday, and Mr Jousserau invited her and Monsieur Vigne and Will and me; and we were all to picnic at Quarley Woods together. We have waited more than an hour already. He was to meet us at the *Quarley Arms*. He can't have forgotten.'

'He must ha' forgotten,' Isaiah answered, 'for he's gone up to London on very important business. It's most likely put the picnic out of his head. I've heard him talk about it; but I don't remember what day he fixed it for.—You're sure it's to-day?'

'Yes,' John insisted. 'It's Madame's birthday. She knows it—own birthday.'

'Hm!' said Isaiah, scratching his head and staring downward at the boys. 'That's a rum start, that is. What are you going to do?'

'I don't know what we can do,' Will answered disconsolately. 'We can't send them back again.'

'Well, no,' returned Isaiah with a long-drawn drawl. 'You can't send 'em back again, I reckon.—Wait a bit; I'll talk to the missis about it.'

The result of the conference was that Isaiah offered the hospitalities of his own house to the disappointed guests, and undertook to explain to Madame the reason of Jousserau's absence. The brake was harnessed to convey her and her husband from their present resting-place. The boys were sent into the garden to await his return; and Mrs Winter and her maid plunged into the kitchen to make ready for these additions to her table. In something over half an hour Isaiah came back, having explained the position of affairs to Madame with perfect success. That excellent personage was profoundly interested in Achilles's love affairs, and proved to be already deeply in his confidence. Mrs Winter having brought matters to such a pass in the kitchen that she could safely leave the maid, assumed her company attire, and related triumphantly the revised and improved story of her interview with Farmer Shorthouse. Madame laughed until her fat sides shook again, and was so appreciative

of Mrs Winter's aftermath of wit, that the hostess corrected earlier impressions and took the warmest fancy to her. The story was, of course, privately discussed; and the boys, as being too young to be entrusted with so important a secret, were shut out from the conference.

After the mid-day dinner, John was eager to show Madame Vigne his new abiding-place, and above all, to display the splendours of that half-ruined turret which belonged wholly to himself.

'Ah but,' said Madame, shaking her sage head, 'your uncle does not like me, my child; and perhaps I am not very fond of your uncle, and altogether it may be best that I should not go.'

'But uncle isn't at home,' John protested eagerly. 'He went away on horseback before I came out. He has gone to Birmingham to the exchange, and when he does that, he never comes home before night-time.'

The boy was so eager, that Madame, after her own good-natured fashion, gave way to him. Mrs Winter, to whom Tallymount Hall had been a sealed mystery all her life, was eager to see it. She had passed the locked gates scores of times in her childhood, and had known the story of the wicked Squire and his ghostly revisiting of the grounds ever since she could remember. She, being assured of Snelling's absence, was as eager to go as John was to take her; and Isaiah being easily persuaded also, the whole party made off to the ruined Hall. John led them to his turret chamber, and displayed his small museum of birds' nests, home-preserved skins of stoat and weasel, the doleful results of an attempt of his own to stuff a kestrel, and other wonders of the like nature. When everything had been inspected, and everybody had been put into a certain position to admire the view from the window, the visitors, who were about to leave, were astonished by the sudden entrance of the master of the place.

Everybody thought him a little pale and worn; but he assumed an aspect of unwonted jollity. 'Showing your friends about, John?' he began. 'That's right, my lad. Make 'em welcome—make 'em welcome.'

His first thoughts had leapt to the idea of some perquisition into his intended crime, and the sound of voices in the chamber had rooted him with terror for a moment. But standing below to listen, he had learned that all the voices were gay and friendly, and he began to see his own advantage in this unexpected gathering. If he had planned it for himself, it would never have been a hundredth part so valuable as it might be now. When he put his plan into execution, and the turret chamber came down with young John in it, he would have the testimony of the boy's best friends to the apparent safety of the place. He would have their testimony, too, as to his relations with his ward; and he tried, by a boisterous, half-hysterical cordiality, to show that they were altogether friendly.

'This is a niceish sort of a place for a young chap to have all to himself, Isaiah,' he said, slapping his old henchman on the shoulder. 'Fine place for a lad to sport about in. I should ha' been rare and proud, when I was a lad, to ha' had the run of anything like it.'

His geniality was a little overdone; and the

friendly clap on Isaiah's shoulder was altogether miscalculated. In place of setting Isaiah immediately at friendly ease, he made him wonder, the friendly freedom was so unlike Snelling.

'The gaffer's been a-drinkin',' Isaiah whispered, a minute or two later, to Mrs Winter, when, after some difficulty, they had succeeded in manœuvring her into a corner.

Mrs Winter formed a voiceless 'No' with her eyes, and then touching her wedding ring with the tip of a forefinger, smiled meaningly.

'Ah!' said Isaiah in a cautious murmur; 'most like you're right; I never thought of that.'

'Well, mum,' said Snelling, turning upon Madame Vigne, with his respectable bulky swagger a trifle overdone, as everything was doomed to be with him that afternoon, 'here's your lad, ye see. He doesn't look as if there was much the matter with him, does he?—Turn your face up, lad, and let the lady have a look at you.—There he is, mum, as bright and healthy a lad as you'd desire to see.'

'Ye-es,' said Madame, 'he is looking very well; he is looking very happy.'

'Your Uncle Robert hasn't eaten you up yet; has he, lad?' said Snelling with a noisy laugh.

Messieurs John and Will both broke out laughing at this; and Madame, who had been looking a little doubtful, permitted herself to smile.

'He's been a twel'month under my care now,' cried Snelling. 'Ask him how he likes it.—Pretty contented, John, my lad, eh?'

'Pretty contented, uncle,' John answered, still laughing.

The ease and informality of this response, and a little gleam of affectionate humour in the boy's eyes as he made it, did more to convince Madame than Snelling's blustering proclamations could have done in a day.

'I shall be very glad to think, sir,' she said, 'that I have been mistaken.'

'Come now,' answered Snelling, 'that's pleasant hearing.—I'm not the man myself to nurse a spite agen anybody, and I'm going to let bygones be bygones all round. I'm sure you meant well by the lad, though you might ha' done much better, maybe, by sending him home again. But that's neither here nor there. You've proved a kindly meaning; and if I hadn't been afraid that you'd be hurt by it, I should have asked to pay you for it, long ago.'

PECULIAR WEDDINGS.

It is our firm belief that more peculiar incidents take place at weddings than at any other public ceremony, religious or civil. We have known a good many odd things happen at weddings, in the course of several years' experience as a town and country parson, and we think a few of them may be worth chronicling for the amusement of the British public. We may fairly say that we were introduced to weddings *en masse*. Our first curacy was at the old parish church in a large northern manufacturing town, where it was no unusual thing to have thirty or forty sets of banns to read out on a Sunday morning, and where the number of weddings was in proportion. We are afraid to say how many happy couples

we united in the first week of our ministerial experiences. We arrived at our curacy on a Monday afternoon, and found on the Tuesday morning ten weddings awaiting us. On our innocently remarking to the clerk that they would take up some time to perform, he informed us, with a sort of pity at our ignorance of how things were done, that we were mistaken upon that point. 'You see, we marries them all at once'—a custom to which we soon got used.

On one Christmas-day morning there were no fewer than seventeen weddings fixed for the same hour, half-past nine. As there was a service at half-past ten, it was not easy to get through the work, even though the happy pairs were 'married all together.' Luckily, our chancel was a large one; so, ranging the wedding parties in a huge circle around us, we stood in the centre, addressing to the congregation at large the exhortations suitable to all alike; and going the round of the circle, from pair to pair, with the questions which have to be put individually. Our old parish, like most other old town parishes, is now divided into ten, and weddings *en masse* are a thing of the past.

We once took a wedding at which the only attendant, besides the groomsmen and bridesmaid, was a stout determined-looking elderly female, who did not come up with the wedding party to the altar rails, but seated herself in one of the choir stalls not far off. We observed that both bride and bridegroom looked at her with very disquieted glances. Once or twice we noticed that the elderly female seemed to be about to make a move, especially at that part of the service when possible opponents are requested to 'speak, or else hereafter for ever hold their peace.' When the service was over, we inquired of this good dame why she had come to the wedding. 'I'm the girl's mother,' was her reply, 'and I came to prevent the business.' We naturally asked why she hadn't 'prevented the business;' and we found that the thought had struck her at the last moment that they 'might do worse than get married, after all.' We have often since thought of what must have been the agitated feelings of that bride and bridegroom until the irrevocable words were said over them.

A terrible incident happened at another wedding, that of a couple both of middle age. There was a grating just in front of the altar rails, which led down to the pipes which heated the building. In his agitation in putting the ring upon the finger of his bride, the unfortunate bridegroom let it go, and it rolled down the grating. The clerk descended and hunted for some time. The ring, however, could not be found. The poor bride shed copious tears, and the bridegroom gallantly stanchied them as well as he could with a large red-and-green handkerchief, murmuring soothingly: 'There, don't 'ee cry—don't 'ee cry,' in the endearing tone which is often used to a baby. We are sure we sympathised; but our sympathy was hardly sufficient to control our risible propensities. A ring had to be borrowed from one of the officials; and the bride's tears were dried at last.

Marrying a couple one or both of whom are deaf is a funny experience. We remember a bridegroom who was perfectly deaf, and could not catch the import of a single word uttered in our

loudest tones. Could he read? we wondered; and to find out, we placed the book before him. Yes, he could; and began: 'I, M., take thee, N., to my wedded wife.' We tried, but in vain, to make him understand that he must substitute his own name for M., and his bride's for N.' He smiled a smile of incomprehension; and we had to leave him to describe himself as 'M.' The words 'ordinance' and 'plight' were too much for him—he shook his head, and left them out altogether. We wondered then, and we have occasionally wondered since, how the courtship of that worthy couple had gone on. It must certainly have been an *affaire du cœur*, not of the mere external senses.

A couple once presented themselves who had not given any previous notice of their intention to be married. The bridegroom, when he was asked why he had not done so, replied: 'Because I want to be married by license.'—'Then,' we said, 'we suppose you have brought the license with you?' But we found, from his answer, that he imagined a license was a document which a clergyman could make out at any moment on a sheet of paper. When he had grasped the idea of what marriage by license really was, and that, consequently, he could not be married there and then, the state of mind into which he and the rest of the party were thrown may be better imagined than described. We felt very sorry for them; but of course we could not help it. It was amusing to hear the ejaculations of the different members of the party. 'Oh dear, what are we to do?' sobbed the bride.—'Well, I have been made a fool of,' said the bridegroom.—'Law is law—yes, law is law, and it can't be helped,' was the philosophical reflection of the bride's father. They were married shortly afterwards, but not by license.

Talking about marriage licenses, it is curious what vague ideas many persons have about them—not only those in the humble station in life to which the couple just mentioned belonged. Twice we have been stopped in the streets, once in a midland factory town, and once in a cathedral town in the south, by respectfully dressed youthful couples, and asked if we were a 'parson;' and on receiving an answer in the affirmative, further asked whether we would make out a license and marry them as soon as possible.

Once, also, we met with an equally curious mistake about banns. After reading the banns for the first time of a young labourer and a young woman whose engagement was unknown to us, we congratulated the parents of the young lady, when we next called, on their daughter's matrimonial prospects. 'Oh,' said the mother, 'she doesn't want to marry him; but I s'pose she must now, 'cause the banns are put up.' And we actually found that the young man had 'put up' the banns entirely on his own account, and had persuaded the girl and her parents that now he could legally claim her as his wife. Explanations followed; and the banns were not published again.

We remember a wedding which had some very peculiar circumstances attending it. All the legal conditions were complied with, and yet there was an air of secrecy and mystery about the whole business. At ten o'clock the bride arrived, in ordinary dress, by herself; at twenty minutes

past ten the bridegroom appeared, coming from quite a different direction, also by himself. A few hurried words were exchanged between them in the vestry. The clerk and sexton, who both happened to be about, were requested to act as witnesses. When the service was over, the bridegroom left the church alone by the west door. Some twenty minutes afterwards the bride departed, by another door, and went off in another direction. We never gained any clue as to the motives for all this secrecy; but 'where there's a mystery there's always a history.' We wonder what their history was.

Only a few months ago we had an odd instance of the way in which a witness may be procured. The happy pair were driven to the church in a local fly, the driver of which appeared subsequently as 'best-man.' He told us afterwards that he had no notion when he reached the church that he was to act in that capacity; but that, when they alighted, the bridegroom told him that to act as 'his man' was 'part of the job'; and so he accommodated himself to circumstances.

Let us conclude this series of wedding recollections by mentioning what we consider a very pretty custom which is observed in some parts of Kent and other southern counties. An arch is constructed by the villagers at the churchyard gate, on which are suspended the implements of the handicraft to which the bridegroom belongs. A carpenter has his saw and plane and foot-rule; a blacksmith his hammer and pinchers and horse-shoes; and so forth. We have seen these sometimes combined in a very tasteful manner. There yet dwells in our memory the case of a bridegroom who had no particular occupation but that of frequenting the public-house, and in his case some cynical friends stood holding a huge basin of beer outside the churchyard gates.

'LA VENDETTA' AMONG THE PATHANS.

CORSICANS are noted among even the vindictive inhabitants of Southern Europe for their peculiarly revengeful dispositions. Their enemies are never forgiven; and the mistaken duty of revenge is handed down from father to son, till a fit opportunity enables them to discharge the supposed debt with the effusion of blood. The Corsican *vendetta*, slow but sure, recalls the words of Byron:

There never yet was human power
Which could withstand, if unforgiven,
The patient watch and vigil long
Of him who treasures up a wrong.

The Corsican's *vendetta*, however, has to wait, and sometimes has waited for many years and scores of years. But there are other nations among whom also revenge is considered a duty; and there are places where public opinion and a firm government do not give even that much protection to life which under ordinary circumstances exists in Corsica itself and the countries into which Corsicans are likely to follow their victims.

Among savage races, whose passions are under no control, and whom a false religion teaches that revenge is a sacred duty, the gratification of that revenge does not take the course of cautious

devising and long waiting. It daringly pounces upon its victim at the very first occasion. There opportunities frequently present themselves, or are easily made for the purpose, by the ardour and ingenuity of the man thirsting for revenge. This holds especially in countries where the excessive heat of the weather and the simplicity of life compel people to live much in the open air, to have several doors and many windows to their houses, and to sleep either with doors and windows wide open, or even in the open air. Among such races one of the most revengeful is the Pathan of Afghanistan and its neighbourhood.

Here is a tale of a Pathan vendetta, carried out in a singularly bloody manner, quite characteristic of the race. We learned the facts during our stay at Nowshera, near Peshawar, in 187-. The scene was a small town at no very great distance from Nowshera, and not more than thirty miles from the British frontier line. The town itself lies in British territory; but its criminals often find an easy and safe retreat beyond our frontier, and consequently out of reach of British justice. When we visited this town, we noticed a large two-storied house, whose appearance, immensely superior in size, form, and material to that of the huts around it, proclaimed its owner a wealthy man among his fellows—possibly their chief. The house, however, was empty; and its look of desolation showed that for years it had undergone no repairs, and was in a fair way to become very soon an uninhabitable ruin. We inquired why it was thus untenanted and uncared for, expecting to hear some weird story of ghost or goblin: instead of that we heard this tale of bloody feud.

The owner of that house had been the chief of the village and the wealthiest proprietor for miles around. He had several sons, but only one daughter, the prettiest girl in the village. Love, that laughs at all social restrictions and inequalities, accidentally threw her, when in her fourteenth year, in the way of a young man of twenty, a common farm-labourer of the village. The girl was of a marriageable age, according to Pathan custom; and the young man, too, was desirous of taking to himself a wife. He was poor; but, in the East, poverty, though not admired, is by no means held despicable. As a counterpoise, he was strong, well built, athletic, and of prepossessing appearance.

Their first meeting had occurred casually, when she went in the early morning, as is always done in the East, to the village well, to fetch water for the day's consumption. The morning breeze had blown aside her veil; and the first sight of her beautiful face in all the glory of its early womanhood had hopelessly pierced the young man's susceptible heart. The girl herself had not been insensible to his good looks and open admiration. It was a case of mutual love at first sight. Courtship in our sense of the word is, of course, an unknown thing among the Pathans. Even speech was out of the question; it would have been an offence against their etiquette, punishable with the sword. But when other means of communication fail, eyes somehow often manage to tell silently the tale of love, and so it occurred in this case. Each morning the youth came at the same hour to the same place, on the way to the village well, where they had first seen each

other. (We call it the village well, *lucus a non lucendo*; they are generally outside the village, and often at some distance.) Just as regularly, too, came the young lady, and allowing her veil to give a glimpse of her face, gratified while she increased their mutual affection. For a few seconds they used to gaze at each other; and they knew that each loved and was beloved in return.

After some little natural hesitation, the young man went boldly to the girl's father and asked his daughter's hand in marriage. Great was the indignation of the village *Croesus*! He quoted, indeed, the oriental proverb, 'The frog has caught a cold.' The young man was shown roughly to the door, much as he would have been in similar circumstances in the more civilised West. After this, the young woman was jealously kept at home. The meetings on the way to the well could no longer take place. But bolt or bar or lock is equally unable to keep out Love. The means were never known, but still the lovers managed to convey messages to each other: write they did not, for of reading and writing both of them were quite innocent. The schoolmaster is not even yet abroad in those regions to any great extent. The result of the rejection of the young man's suit was like the attempt to dam a stream, or to extinguish a fire with oil. It only increased the ardour of the young people; and as soon as the first vigilance of her family began to relax, under the impression that the young man's pretensions had been effectively crushed, the lovers did what other lovers have done under similar circumstances—they eloped.

One morning when the family arose, the young woman was nowhere to be found. It was soon discovered that the young man, too, had disappeared during the night; and the best horse also of the village chief was missing. There could be no reasonable doubt that all three had gone away together, the lover carrying off his beloved on her father's horse. Before daybreak they were safe in independent territory. Trained and expert trackers, of whom each family has a few, had traced their journey over the frontier. News soon after arrived that in a village some miles beyond the frontier, in independent territory, they had found an equivalent to the olden Fleet Prison parsons and Gretna Green smith, in the person of a complaisant *Moolah* or Mohammedan registrar. For a consideration, he had quickly united the pair in wedlock, according to the simple rites of the Mohammedan religion. They were therefore legally and honourably married, both according to their religious and social codes, which are in reality identical. But the abduction of the girl and the theft of the horse—one just as much as the other—was a deadly insult to the bride's family; and among Pathans, insults, like injuries, are atonable only with blood. That blood would be shed was not only a foregone conclusion; it was, according to their ideas, even a positive duty.

Every Pathan owns a long, sharp, and keen knife, and a sword, and most of them also a matchlock. Every man is trained from childhood to the effective use of these weapons. The two families numbered among them some twenty adult males who 'played with the sword.' All these had, of course, become parties in this deadly feud, though not one had been an aider

in the act that caused it, or had even known that it was contemplated. No matter. Every one well knew that a systematic butchery must soon ensue. The young people also had known it, and they had doubtless discounted in their minds the fatal cost of the step which love and the old man's obstinacy and pride had forced upon them. Houses in those parts, as already remarked, are seldom locked, the windows easily admit an intruder, and the mud walls can be quickly and noiselessly broken into. Agricultural labour daily takes nearly every one into fields and lonely places. Blood is hot; revenge burns fiercely; opportunity is not rare. It caused, therefore, no surprise when, a few days after the elopement, the bridegroom's father—about fifty years old—was found dead on his bed, stabbed to the heart while asleep. The Pathan knife, the deadly *churah*, is of a uniform size and make; and there is little chance of identifying a murderer if not caught red-handed in the very act. No prolonged investigation was made. Every one knew the cause and the motive of the murder, though it was impossible to prove whose was the hand that had dealt the fatal blow. The corpse was buried in the evening. The following morning, one of the brothers of the bride was found stiff and cold, also stabbed to the heart with a *churah*. He, too, was buried.

A few days passed uneventfully; but all knew, of course, that this second murder also had to be avenged; or, to put it in another form, a life had been taken for a life, leaving the original insult still to be dealt with. A few days afterwards, another man fell of the bridegroom's family—shot dead in the fields, and that death was speedily avenged by the murder of another made from the bride's family. And so the deadly feud progressed, each family being alternately murderers and victims. The authorities tried to stop the slaughter, and the police appeared in numbers. None, of course, knew anything about the murders or the cause: they were quite accidental—'who did them, and why, God only knew.' The members of each family disclaimed all feelings of anger, all desire of revenge. Things were quiet while the 'authorities' were about. As soon as they were gone, the smouldering embers soon burst into flame, and alternate murder thinned the ranks of both families. At last the bride's father and the bridegroom were the sole two males left—one in each family.

One night the bridegroom rose quietly from the side of his sleeping bride; he saddled the stolen horse and rode swiftly to his native village, the now desolate home of his childhood. Dismounting at some distance, he tied his horse to a tree and entered the proud but almost deserted mansion of his father-in-law. With his sword he slew the heart-broken and bereaved old man, regained his horse, and rode back to the new home of his exile by the morning light. His wife was already up. He folded her tenderly in his arms, yet stained with her murdered father's blood; and thus gently he broke the news: 'We must now love each other only the more fondly, my own heart: our fathers and brothers all sleep in peace.' She understood him fully, and was not at all surprised, for she had already guessed the object of his nocturnal journey. They had both well known from the beginning

what was the only possible result, according to their customs, of the step which they had taken.

In four months a score of men, 'brave and true and mighty in war,' had been laid low in bloody and untimely graves by the assassin's bullet, sword, or knife. The feud, which had sprung up and raged like a volcano, was speedily quenched in blood. But the more natural and pleasing fire of wedded love continued to burn not the less warily, brightly, and constantly in the hearts of the lovers, though it had caused the destruction of both families.

Let Corsica yield the palm to Afghanistan in the matter of deadly vengeance.

SEA-LIONS AND SEA-BEARS.

THERE are perhaps comparatively few people who are aware that the sealskin of commerce is not made from the skin of a seal but from a different animal altogether. It is true that the skins of seals are used for clothes; but the best 'sealskin,' which is familiar to everybody, is the product of a sea-bear or eared seal, which is, however, popularly known as the Northern Fur Seal (*Arctocephalus ursinus*). This animal inhabits the North Pacific shores, and is there extremely abundant. It is called the *fur* seal because of the fine soft fur which covers the body; interspersed among these are coarser hairs. Closely allied species occur in the southern hemisphere; and in both regions there are other eared seals which lack the fine fur and only possess the coarse hairs. These 'hair seals' are not commercially of so much value. The term sea-bear is commonly applied to the fur seals, and sea-lion to the hair seals. They both belong to the group of eared seals, which, though confounded by the earlier naturalists with the true seals, are in reality quite distinct from them. The eared seals form, in fact, a very natural assemblage of animals; any one who will take the trouble to compare the Patagonian sea-lion with the British seal at the Zoological Society's Gardens can readily see the important differences that distinguish them. The sea-lion has small but distinct external ears; in the seal the 'conch' of the ear is entirely absent, and the aperture of the ear is alone visible. The limbs of the sea-lion are just as fitted for swimming as those of the seal, the whole limb forming a flat paddle; but in the sea-lion the hind-limbs are capable of a freer motion, and the animal can therefore progress with comparative ease upon land; indeed, the small Cape sea-lion can run with some rapidity upon dry land. The seal, on the other hand, is more completely fitted for a marine existence; the limbs are more closely connected with the trunk, and it is unable to make use of them upon the land. Under these circumstances, its progression is simply due to the muscles of the abdomen: it wriggles along as a man would do if placed upon his face with the legs and arms tied.

The intelligence of the sea-lion appears to be rather greater than that of the seal. The keeper in charge of these animals has succeeded in teaching the Patagonian sea-lion a number of tricks, which it performs at feeding-time for the gratification of the visitors. In short, it may be safely held that the sea-lions or eared seals are more nearly akin to the terrestrial carnivora than are

the seals, and that they have more recently become adapted to an aquatic existence. Unfortunately, we cannot at present do more than speculate as to how the land ancestors of the sea-lions first took to an aquatic life. Some few remains of sea-lions are known to us in a fossil condition; but they offer no suggestion as to how the transition took place. These remains, which are, of course, only bones and teeth, agree in every character with existing sea-lions, and have not belonged to 'transitional forms.' But before attacking this problem, let us pause to reply to a question which might not unnaturally occur to some: How can it be assumed that sea-lions and seals have descended from terrestrial ancestors? Is it not at least possible that they have always been marine animals from the beginning of time? It is true that these animals have a fish-like form, tapering at both extremities, and are furnished with 'flippers' or fins. But there is a great difference between the fins of a seal and the fins of a fish. The skeleton of a seal's fin shows an exact resemblance to the limb of a quadruped; the five fingers are there, and even the nails at the extremities of the fingers, only they are encased in a common integument; the web-footed condition, which is found in the otter and other animals which lead a partially aquatic life, is exaggerated. The fins of a fish show no such resemblances to limbs which are found in terrestrial animals. Furthermore, in every point of its organisation the sea-lion or the seal agrees with the mammalia, and particularly, as has been already stated, with that group of mammals termed carnivora. No one can doubt that mammals are essentially terrestrial animals; not only because, as a matter of fact, the vast majority are dwellers upon the land, but because nearly every point in their structure indicates that that is their natural habitat. For example, the lungs are suited to breathe air directly, and cannot make use of the air dissolved in water as the gills of a fish can. If the sea-lion had been always an aquatic animal, its resemblances to the terrestrial carnivora would be absolutely inexplicable.

The otter offers a valuable hint as to what the very earliest sea-lions probably resembled. Any one who has watched this creature in captivity—in its natural haunts it is practically impossible to study it—cannot fail to have been struck by the ease with which it changes from a terrestrial to an aquatic life. It runs about with activity upon the land, glides into the water with an imperceptible splash, and swims with the rapidity of a fish. Its elongated form, short limbs, and webbed hind-feet are not disadvantageous to it when upon dry land, and are clearly admirably suited for swimming. The sea-lion represents an advanced stage in the conversion of a terrestrial into an aquatic form; the limbs have become shortened and more fin-like; that is, more suited to swimming, and less suited to walking; the hind-limbs are closely approximated to the rudimentary tail, and perform to some extent the office of the fish's tail—that of steering.

The seals are still further advanced in the same direction: the general form of the body is if anything more fish-like; the hind-limbs are more closely bound up with the tail, and form, therefore, a more efficient steering organ; the external ears have disappeared. It must be

remembered that the function of the external ear is that of concentrating sounds, which are conveyed through the aperture to the internal ear, which is the organ of hearing; accordingly, there is not so much need of an external ear in animals which live in water, where sound travels better than in air. The absence of an external ear in seals indicates, therefore, their longer adaptation to an aquatic mode of life.

It may be gratifying to those whose business is transacted at sea to learn that, generally speaking, marine animals have a larger brain than their land allies. In other respects it will be seen from what has been said that the marine carnivora are as compared with the land carnivora degenerate; but this degeneration has only affected such parts of the body as are useless in their changed mode of life. Degeneration, in fact, in this case goes hand in hand with progression.

Although there is no great difficulty in imagining how the conversion of a terrestrial carnivore into a seal may have taken place, we still require a motive for such a change. It seems almost as if the marine carnivora would have done much better for themselves if they had remained in the other condition. Frequently, however, Nature does not allow of such a choice; gradual changes in sea and land have taken place, and are taking place, in our globe; the result of these must in many cases have been the stern command to some groups of animals, 'Be modified or perish.' There are certain facts which indicate that sea-lions became sea-lions not from choice, but in obedience to this command. Mention has been made at the commencement of this article of the northern fur seal; besides this species, only two others, the Californian sea-lion and Steller's sea-lion, are found in the northern hemisphere; all the rest that are known—perhaps seven or eight distinct species—are confined to the antarctic region. There is therefore some reason to suppose that the headquarters of the race being in the antarctic area, they have originated there.

Now, there are no terrestrial carnivora known, either living or fossil, in any of the land-masses bordering upon the antarctic area which are so like sea-lions as to be probably descended from the same stock. This statement, however, naturally only applies to South America, Australia, and New Zealand, and not to the great antarctic continent which covers the South Pole; we have no knowledge of this land-mass, for the very good reason that an impenetrable wall of ice, formed by the congealed masses brought down by innumerable glaciers to the sea, for the most part prevents all access. We know that long ago the northern hemisphere down to the level of the northern English counties was covered with a great ice-sheet. This period, which has left its traces in the form of glacial mud and moraines, is known as the Glacial Period. The phenomena are believed to be due to certain astronomical causes into which it is not necessary to enter at present, except to say that such glacial periods are recurrent and alternate from the northern to the southern hemisphere. There is at present a glacial epoch in the southern hemisphere.

Judging from the facts at our disposal, it is highly probable that at one time the southern continent enjoyed a comparatively mild climate, and supported an indigenous fauna and flora.

Among the animals which flourished at that time may have been the immediate ancestors of the sea-lions. The increasing cold may fairly be supposed to have gradually extirpated the land fauna, and compelled the ancestral sea-lions to seek their food in the water. In order to secure sufficient prey, some modification in their structure suiting them to a partially aquatic life was gradually acquired and increased in successive generations. Finally, the entire burying of the land beneath a vast ice-sheet drove them off the land altogether, and those animals which were best prepared for this change alone survived, and transmitted these very peculiarities to their offspring. This is, of course, a suggestion as to the reasons which led to the origin of sea-lions which may or may not prove to be correct.

LOST LITERATURE.

By Lost Literature we mean not the literature which has been lost by the premature death of genius, nor that left unfinished—such as the late John Foster's invaluable *Life of Swift*—but literature actually produced and now irreparably lost. There are doubtless thousands of plays, novels, and other works so lost which did not deserve to live, and we ought to feel thankful that they are gone. Occasionally, somebody issues 'an unpublished poem' by Burns, or 'a hitherto overlooked letter' of Sir Walter Scott. This raking-up of neglected effusions is usually a thing to be discouraged. It is seldom possible that really good productions can remain long undiscovered, and it is no kindness to the great dead to publish hastily conceived and ill-considered efforts. There is usually, too, a suspicion attaching to such discoveries—a feeling which recalls the famous frauds of Macpherson, Chatterton, and Ireland.

The fine literature absolutely lost is very considerable. Classical literature alone, books could be filled with the mere names of works, never to mention the mutilated state of many that survive. The causes of loss are few. Fire is the most common. Ben Jonson by a fire in his house lost an entire drama, a *Life of Henry V.* with notes, and a number of other works. The Fire of London was responsible for the loss of many valuable works of the Elizabethan period and of much early English poetry. A severer blow to lovers of Anglo-Saxon literature was the burning of the Cottonian Library in 1731, when a vast quantity of old manuscripts was destroyed. In 1752, by a fire in Lincoln's Inn Fields, a large collection of manuscripts and pamphlets gathered with great labour by Lord Chamberlain Somers was lost. About the same time, Davies' *Notes on Cicero's De Officiis* were lost by a fire in the Strand of London. In 1780, Lord Mansfield's library was destroyed by fire, and caused an immense loss of manuscript treasures.

Of the treasures lost by fire during times of war, volumes might be written. Not to go beyond this century, we might mention the loss of the invaluable manuscripts of Joh. Gottl. Buhle in the burning of Moscow. Nearer our own time, the Franco-Prussian War caused severe losses to various important French libraries.

The second cause of loss is the ocean, whose 'greedy maw' swallows all kinds of treasure

so remorselessly. Early in the fifteenth century, Guarino Veronese was returning to Constantinople with a shipload of classical manuscripts. The vessel was wrecked, and the treasures lost, a misfortune which turned the scholar's hair white in a few hours. Our own Spenser suffered serious loss by the shipwreck of a servant crossing from Ireland. The last six books of the *Færie Queene*, and a considerable number of translations and poems, including *Dreams*, *The Court of Cupid*, and *The Hell of Lovers*, were thus consigned to a watery grave. In 1600, on the death of Vincentio Pinelli, his library was packed in three vessels bound for Naples. One was attacked by pirates, who flung out the books and papers into the water and along the shore, some of the precious manuscripts being used to stuff windows with! In 1698, a Dutchman named Hudde—who while in China had passed himself off as a native, and had attained to the dignity of a mandarin—had, after thirty years' labour, collected a huge mass of manuscripts. On his way home he was shipwrecked, and his collection was totally lost, one of the most remarkable and regrettable of all literary losses.

Ignorance and culpable carelessness have been responsible for some sad losses. The selfishness of theatrical managers, who forbade the printing of plays, caused terrible losses and mutilations in the domain of Elizabethan literature. Shakespeare and others whose works are preserved have suffered much, and but for the carelessness of collectors, the fierce discussions about 'correct readings' would have been greatly diminished. Heywood—described by Lamb as a prose Shakespeare—was the author or joint-author of over two hundred plays, few of which remain. Many valuable dramas of Massinger, Ford, Webster, and Middleton were also lost through carelessness; and besides dramas, we have lost Heywood's *Lives of the Poets*. Heywood was the friend of Shakespeare and other dramatists from 1595 to 1630, and had written their *Lives*, with a mass of curious anecdotes and reminiscences. If this work had been preserved, we should probably have been spared the absurd question, 'Who wrote Shakespeare?' A very curious loss was occasioned in Italy in the fourteenth century when Raimondo Soranzo lent the manuscript of Cicero's *De Gloria* to a friend, who pawned it, and who died before its hiding-place could be discovered.

Domestic servants are not often possessed of literary tastes, and they are frequently forbidden to dust, or even to enter, studies and other apartments sacred to literary genius. They have, however, succeeded in committing several horrible blunders. Towards the close of last century, a servant of Warburton, the Somerset Herald, came across a unique mass of manuscript plays, which she used up in lighting fires and making pie-crust frills! Truly, to what base uses we may return! And everybody remembers how a domestic of John Stuart Mill consigned to the flames part of the manuscript of Carlyle's *French Revolution*. The horror of Mill at the loss, and the 'agony' of Carlyle in rewriting the work, are now matters of history. Luckily, it was not 'lost literature.' Strangely enough, the losses through manuscripts becoming illegible by damp or dirt are not so numerous as might reasonably be expected.

We have alluded to the general undesirability of publishing all an author has written; but, on the other hand, censors and editors have sometimes been too severe in their judgments. Hurd, for example, can never be pardoned for allowing Cowley's Letters to perish; nor can Pope be more favourably regarded for having decreed the destruction of Lord Peterborough's Memoirs, which would have been of much use to historians. Pope, however, suffered personally in this respect, his prose treatise on *The Immortality of the Soul* being condemned to mortality. A very serious loss was the destruction of Crabbe's novels, *The Widow Grey*, and others. Byron truly described this poet as 'Nature's sternest painter, yet the best;' and his descriptions of scenery and manners must have been of much value. Moore, again, was responsible for the destruction of Byron's Memoirs.

There are some reliable instances recorded of valuable works being destroyed by their authors. Fracastor, an eminent scholar of the sixteenth century, had written in Latin a wonderful *History of Venice*, and in a paroxysm of fever he burned it.

Notwithstanding these and many other sad losses, there is much to be thankful for. When we consider the miraculous manner in which many works have been preserved, we are apt to wonder that more have not been destroyed. Britain perhaps compares favourably in this respect with most continental nations, and the works left us constitute our literature the grandest in the world.

CHILDREN'S FACES.

You bring me peace, O innocent child-faces!
With your clear questioning eyes,
Your fairy forms, your sweet unconscious graces,
Your lips, where laughter lies.

Out in the world too long, I grow heart-weary;
But in these leisure days,
Throwing aside the old routine so dreary,
I join the children's plays.

What fun we have! what skating and what racing
Out in the frost and snow!
What battling with the north wind, keen and bracing,
That sets the blood aglow!

In twilight, round my chair they love to gather,
To hear the story told—
Heroic tales of many a brave forefather
In stirring days of old.

Ofttimes I pass the room where they are lying,
Each in a snowy bed,
And hear my little name-child sweetly trying
To pray for 'Uncle Fred.'

God bless the children with their rosy faces!
Their eyes like Truth's clear wells,
Their loving hearts, their many heavenly graces,
Their lips, where laughter dwells.

THE TRACE OF OLD TIMES.

It is man's prerogative to be possessed of the gift of history and to interest himself in ancient things. He 'considers the days of old.' The instinct which lies at the bottom of every historic study is a feeling which we and the world of to-day have developed out of the old time that was before us. The due understanding of the Past is but a deeper way of looking at the life that now is. Every part of our modern appliances is the outcome of an innumerable succession of things that led up to it. The genius who startles the world with a 'new' discovery simply avails himself of materials which previous hands have prepared for his use, and passes them on in a more highly developed form.

If, for example, we take the Walter Printing Press, with its marvellous adjustments of mechanism, it is pointed out to us how this or that factor of the machine is an 'improvement' on something earlier; and so our thoughts are led back step by step farther than the time when Caxton or Gutenberg put his blocks of letters together and produced printed words; while, if we place ourselves in imagination in Caxton's printing-office, it is only to look back still farther to the things from which he and his opportunity had in turn been evolved. This 'looking back' is not only a necessity in the promotion of man's material progress, but belongs at the same time to the finer, the poetic instincts of life; and it would be surprising if it did not possess a profound fascination for many thoughtful minds. The historian, the antiquary, and in another way the scientific student of nature—of which Darwin is the great type in our day—all find their varied interest in that past world from which we have grown to be what we are. It is not a dead past. Its voices are not mere echoes from the tombs. If 'a primrose by the River's brim' is to the poet something more, so to the instructed and thoughtful student of antiquity is even a fossil something more than a fossil. There is in the past a perennial revelation.

It is part of the grand, silent procession of a Life which has no beginning and no end, which 'remakes the blood and changes the frame,' and which for the moment is ours.

The main interest of the Past, as of everything in life, centres in man and in the question how man has acted. The average person does not go very far back in this retrospection. His history begins with the Conquest, which to him is real history. He dimly knows that there was an old world of Greeks and Romans; an old world of Hebrews and Egyptians; but his thought about such things is so touched with the 'far-off' colour, that they might as well belong to mythology altogether. Perhaps one day he chances to go into a museum and see an Egyptian mummy, and then he half realises that, folded round and round in these decayed wrappings, is the body of some one who did actually live on this earth three thousand years ago—lived joyously in the light of the same sun, loved, and suffered, and fell on sleep at length. Such impressions are, however, too fragmentary to exercise much permanent influence on his mind and life. It is when we come to our own good, bad, and indifferent kings and their deeds—and the nearer to the present age the better—that the ordinary historic sense is felt. Henry VIII. bulks out largely, if only for the very human consideration that he had six wives. Queen Elizabeth commands recognition for her long reign, and because her powerful character achieved lasting results for her country's good. King John has told upon the general memory through his association with Magna Charta. Oliver Cromwell is a solid fact; and Charles I. is another fact, if not quite so solid. And their works live after them. Most intelligent persons know in some measure that such figures have gone before them and had a hand in making the world; and if there is too much of 'royalty' in the retrospect, it is partly from the fact that the king stood for more in the old days than he stands for now; and partly because we learned our history in 'bad form.' The conception of the subject has enlarged; we begin to know that it

was not only the privileged few at the top of the social scale that framed our destiny, but the work and life of common men, whose names did not outlast their little day; 'the mute, inglorious' Miltons, the Cromwells and Charles the Firsts of some obscure corner of the land; as the earth has been fertilised by thousands of tiny rivulets as well as by the few great streams.

Everything is of value which reminds us of an earlier age; every monument by which we trace the life of men before we come upon the scene. England is, happily, still rich in these mementoes. In a fuller sense than that in which Colonials speak of it, ours is the 'old country.' Our painters love to make the village church, with moss or ivy overgrown, a feature of their landscape; and the poet stirs the solemn note of a thousand years when he sings:

Old yew, which graspest at the stones
That name the underlying dead,
Thy fibres net the dreamless head,
Thy roots are wrapt about the bones.

You may travel over immense tracts of country in America and not come upon anything even to remind you of that village church. A mighty country it is, impressing us with its amazing wealth and variety of resources, and the almost feverish forward hurry of its industries; but the beautiful mark of age is not there, in the nature of things. Nor, for the most part, do the people think of building—as Ruskin says we ought to build, and as undoubtedly our forefathers tried to build—'for all time.' With this and the succeeding generation a great deal that is now considered of importance will be taken down—if it doesn't tumble down and save men that trouble—and make room for something else, and 'it never will be missed.' One comes home with renewed veneration for the things among us which are daily telling the story of antiquity. The best of our American cousins feel it too, and they come to England sighing at the sight of 'something old.' They make pilgrimages to several spots in which the past is most at home. They go to Chester, and Canterbury, and our ancient universities. It is, in the phrase of one of themselves, 'like nuts and old port' to walk over the ground which has been trodden by the feet of our famous men, and see where they are laid to rest.

For age, indeed, we have nothing to compare with 'the land of Egypt.' There are no English mummies; no Sphinx looks down upon us from the far, still centuries. But if the comparison of actual periods of time is not in our favour, some other things give us the advantage of a better standpoint from which to view the past. In Egypt the change between Then and Now, from the time of the Pharaohs to our own, has been far less—in the sense we are considering—than that between England of the Middle Age and the England of to-day. A colossal decay is all that is visible in the land of the Pharaohs. The improvements, the modern appliances have not come in to give relief to it. With us the old and the new exist side by side; the old, alas, in too rapidly diminishing quantity. The modern railway train carries one, at the rate of sixty miles an hour, to the classic seats of 'quaint and olden' memories. The Roman wall and

the Norman church meet us in our country rambles.

The march of improvement is imperious, at times ruthless; everything has to go before the destruction which is regarded as necessary to the progress of mankind. But the conception of what is necessary, it may be hoped, is becoming more enlightened, and a more reverent sense is growing up as to the honour due to ancient landmarks. If it be necessary that we should get our letters by the first post, or dine and do our sleeping while the train bears us along at express speed, yet it is even more necessary that we should know something of the long chain of things of which our lives form the link now being wrought on the anvil of time and change. More and more, in proportion as 'the old order changes, giving place to new,' the relics of that Past are invested with poetic and religious value, as they make their mute appeal. And their mission is not only to serve us the skeleton at the feast of life, and fill us with the pause and sadness of mortality, but to teach us the lesson contained in Wordsworth's lines:

Enough, if something from our hands have power
To live and act, and serve the future hour;

And if, as to the silent tomb we go,
Through love, through hope, through faith's transcendent
dower,

We feel that we are greater than we know.

A DEAD RECKONING.

CHAPTER III.

WHEN George Crofton informed Mrs Brooke that it was while riding along the road outside the park palings he had seen her husband leaving the house, he stated no more than the truth; but one little point he had not seen fit to mention—that he himself was not alone at the time. When he had recovered from his momentary surprise at seeing his cousin, he had said to his companion—an extremely handsome young person in a riding-habit that fitted her like a glove: 'Let us put the pace on a bit, Steph. I've just remembered that there's a call I ought to make while I'm in this neighbourhood.'

A few minutes later they pulled up at the *Beechley Arms*, a country tavern only a few hundred yards distant from the back entrance to the park. Here Mr Crofton had been well known in days gone by; and by the time he had dismounted and had assisted his companion to alight, the buxom landlady, all smiles and cap-ribbons, had come to the door to greet him.

'Why, Master George, it's never you sure-ly,' she said. 'It seems like old times come back to see you come riding up just as you used to do.'

'Then you have not quite forgotten me, Mrs Purvis,' he said, as he shook hands with the landlady with that air of easy affability which he knew so well how to assume. 'I don't wish to flatter you, but, on my honour, you look younger every time I see you.'

The landlady smirked and blushed, and said: 'Get along with you, do, sir,' and then led the way to her best parlour, an old-fashioned, low-ceilinged room, with a diamond-paned window and a broad, cushioned window-seat.

George ordered some sherry and biscuits to be brought; and as soon as the landlady had left the room, he said to his companion: 'I shall have to leave you for half-an-hour, Steph, to make the call I spoke of just now; I shall be sure not to be gone longer. You won't mind, will you?'

Mademoiselle Stephanie made a little *moue*. 'I suppose you will go whether I mind or not,' she said.

'I must go,' he replied. 'It is a matter of extreme importance.'

'In that case there is nothing more to be said,' she answered with a shrug. A moment later she added: 'Only, remember, if you are away much longer than half-an-hour, Tartar and I will go back home by ourselves, and leave you to follow at your leisure.'

George Crofton laughed. 'Never fear, *carissima*; I won't fail to be back to time. Besides, our dinner will be waiting for us three miles farther on. Did I tell you that I had ordered it by telegraph before leaving town?'

'There's one thing neither you nor I must forget,' she answered, 'and that is, that I'm due at the *cirque* at nine o'clock to the minute. Signor Ventelli never forgives any one who is not there to time.'

At this juncture Mrs Purvis came in with the wine and biscuits. George hastily swallowed a couple of glasses of sherry; and then, after giving a few instructions with regard to the horses, and reiterating his promise not to be gone more than half an hour, he went.

Mademoiselle Stephanie Lagrange was a very pretty woman—a fact of which she was perfectly cognisant, as most pretty women are. She had a profusion of light silky hair, and large steel-gray eyes that were lacking neither in fire nor audacity. Her lips were thin and rather finely curved; but her chin was almost too massive to be in proportion with the rest of her features. Her figure was well-nigh perfect; and as she was a splendid horsewoman, she never appeared in the *flou* without having a hundred pair of eyes focused on her, and a hundred tongues asking eagerly who she was. In case the reader should put the same question, it may be as well to state that Mademoiselle Lagrange was a prominent member of the celebrated Ventelli Circus troupe, on whose posters and placards she was designated in large letters as 'Queen of the Haute Ecole.' Whether Mademoiselle Lagrange was of French or English extraction was a moot-point with several of those who knew her best, seeing that she spoke both languages equally well. Some there were who averred that she spoke English with a slight French accent, and French with a slight English accent; but be that as it may, no one knew from her own lips where she was born or of what nationality her parents had been.

As soon as she was left alone, Stephanie took off her hat and veil and seated herself on the window-seat, from whence she could look into a strip of old-fashioned garden at the back of the tavern. As she nibbled at a biscuit and sipped her sherry—Steph was by no means averse to a glass of good wine—she soliloquised, half aloud: 'Why has my good friend George left me, and who is the person he has gone to see?—Eh bien, cher monsieur, there appear to be certain secrets in your life of which I know nothing. It must be

my business to find out what they are. I like to have secrets of my own, but I don't like other people to have secrets from me.'

At this point, in came bustling Mrs Purvis, ostensibly to inquire whether the lady was in need of anything, but in reality to satisfy in some measure the cravings of her curiosity. She found Mademoiselle Stephanie by no means disinclined for a little gossip; only, when she came to think over the interview afterwards, she discovered that it was she who had answered all the young lady's questions, but that the young lady had answered few or none of hers.

Yes; she had known Master George from quite a boy, Mrs Purvis went on to say, gratified at finding a listener so ready to her hand. He had been brought up at the Towers—the great house in the park there—and everybody thought he would be his uncle's heir. But as he grew up he fell into bad ways, and all sorts of tales were told about his extravagance and dissipation; and no doubt he was made out to be far worse than he really was. At length the old gentleman turned him out of doors, and made a fresh will in favour of his other nephew, Mr Gerald Brooke—he who now lives at the Towers—while Master George had to content himself with a legacy of five thousand pounds. And then there was Miss Dunby—the late vicar's daughter—whom everybody thought Master George would marry; but she, too, turned against him, and married his cousin, so that he lost both his inheritance and his wife.

'And does this lady whom Mr Crofton was to have married live at the place you call the Towers?' asked Stephanie.

'Certainly, miss. She is mistress there; and a very beautiful lady she is.'

'It is her whom he has gone to see,' said Stephanie to herself. 'He pretends that he loves me, but he cannot forget her.—So this is your secret, *cher George*! I shall know how to make use of it when the time comes.'

Suddenly she started half rose from her seat. Her eyes had been caught by something outside the window. She turned quickly on Mrs Purvis. 'That child—where does he come from? Who is he?'

The landlady's gaze followed hers through the window. 'Do you mean that little fellow on the grass plat who is throwing crumbs to the birds? He's a mountebank's son, as you may see by his dress. His father is having some bread-and-cheese in the kitchen. What a shame it is that such a dear little mite should have to earn his living by turning head over heels in the streets.'

For several moments Stephanie stood motionless, her eyes fixed on the child. Then, without turning her head, she said: 'Thank you. I require nothing more at present. When I do, I will ring.' The tones in which the words were spoken conveyed more than the words themselves. Mrs Purvis bridled like a peacock, shook her cap-ribbons, and marched out of the room, slamming the door behind her with unnecessary violence.

There were two doors to the room, one by which the landlady had made her exit, and another which led into the garden. This second door Stephanie now opened, and at the sound the boy raised his eyes. She beckoned to him, and he

came forward. It may be that he had visions of more fruit and sugared biscuits.

Stephanie drew him a little way into the room, and going down on one knee, she passed an arm round his waist. It was evident that she was full of suppressed emotion. The conversation that ensued was carried on in French.

'Tell me your name, *cheri*.'

'Henri Picot, mademoiselle.'

She had known what the answer would be; but for a moment or two her lips blanched, while she murmured something the boy could not hear.

'And your father?' she said at last.

'He is here, indoors. Poor papa was tired; he is resting himself.'

'Does your papa treat you kindly, Henri?'

The boy stared at her. 'Papa always treats me kindly.—Why should he not?'

'And your mamma?' said Stephanie with bated breath.

Henri shook his head. 'I have no mamma,' he answered with a ring of childish pathos in his voice. 'She has gone a long, long journey, and no one knows when she will come back. Papa does not like me to talk about her—it makes him so sad. But sometimes I see her in my sleep, and then she looks beautiful, and smiles at me. Some day, perhaps, she will come back to papa and me.'

She kissed him passionately, to the boy's wonderment. Then with a half-sob in her voice, she said: 'But you have a sister, have you not?'

Henri's large eyes grew larger. 'No; I have no sister,' he answered with a shake of his head.

'But you had one once, had you not? Does your papa never speak of her?'

'No; never. I had a mamma, but I never had a sister.'

For a moment or two Stephanie buried her face on the child's shoulder. What thoughts, what memories of the past, rushed through her brain as she did so? 'Cast off and forgotten!' was the mournful cry coming from her heart.

Suddenly a voice outside was heard calling, 'Henri, Henri, où es-tu?' followed by a note or two on the pipes and a tap on the drum.

'Papa is calling me; I must go,' said the boy.

Stephanie started to her feet, and lifting him in her arms, kissed him wildly again and again. Then setting him down, she pressed some money into his hand and turned away without another word. Henri darted off.

'He is gone—gone—and perhaps I shall never see him again!' She sank on her knees and buried her face in the cushions of the window-seat. Her whole frame shook with the sobs that would no longer be suppressed.

Five minutes later George Crofton entered the room. For a few seconds he paused in utter amazement; then going forward, he laid a hand on the girl's shoulder. 'Steph,' he said, 'Steph—why, what's amiss?' As he spoke his eyes rested for a moment on Picot and Henri, who were crossing the grass-plat hand in hand.

CHAPTER IV.

'Pardon. I hope I do not intrude?' said M. Karovsky, addressing himself to Mrs Brooke with the suave assurance of a thorough man of the world. 'I saw through the window that Mr Brooke

had returned, and as my time here is limited—*me voici*.' Then advancing a few steps and holding out his hand to Gerald, he added: 'It is five years, *mon ami*, since we last met. Confess now, I am one of the last men in the world whom you thought to see here?'

'You are indeed, Karovsky,' responded Gerald as he shook his visitor's proffered hand, but with no great show of cordiality.—'Have you been long in England?'

'Not long. I am a bird of passage. I come and go, and obey the orders that are given me. That is all.'

'My wife, Mrs Brooke. But you have seen her already.—Clara, Monsieur Karovsky is a gentleman whose acquaintance I had the honour of making during the time I was living abroad.'

'May we hope to have the pleasure of Monsieur Karovsky's company to dinner?' asked Clara in her most gracious manner, while at the same time hoping in her heart that the invitation would not be accepted.

'*Merci, madame*,' responded the Russian, for such he was. 'I should be delighted, if the occasion admitted of it; but, as I said before, my time is limited. I must leave London by the night-mail. I am due in Paris at ten o'clock to-morrow.'

'For the present, then, I must ask you to excuse me,' said Clara.

Karovsky hastened to open the door for her, and bowed low as she swept out of the room.

'That man is the bearer of ill news, and Gerald knows it,' was the young wife's unspoken thought as she left the two together.

M. Karovsky was a tall, well-built man, to all appearance some few years over thirty in point of age. His short black hair was parted carefully down the middle; his black eyes were at once piercing and brilliant; he had a long and rather thin face, a longish nose, a mobile and flexible mouth, and a particularly fine arrangement of teeth. He wore neither beard nor moustache, and his complexion had the faint yellow tint of antique ivory. He was not especially handsome; but there was something striking and out of the common in his appearance, so that people who were introduced to him casually in society wanted to know more about him. An enigma is not without its attractions for many people, and Karovsky had the air of being one whether he was so in reality or not. He was a born linguist, as so many of his countrymen are, and spoke the chief European languages with almost equal fluency and equal purity of accent.

'Fortune has been kind to you, my friend, in finding for you so charming a wife,' he said, as he lounged across the room with his hands in his pockets, after closing the door behind Mrs Brooke. 'But Fortune has been kind to you in more ways than one.'

'Karovsky, you have something to tell me,' said Brooke a little grimly. 'You did not come here to pay compliments, nor without a motive. But will you not be seated?'

Karovsky drew up a chair. 'As you say—I am not here without a motive,' he remarked. Then, with a quick expressive gesture, which was altogether un-English, he added: 'Ah, *ban!* I feel like a bird of ill-omen that has winged its way into Paradise with a message from the nether world.'

'Whatever your message may be, pray do not hesitate to deliver it.'

But apparently the Russian did hesitate. He got up, crossed the room to one of the windows, looked out for half a minute, then went back and resumed his seat. 'Eight years have come and gone, Gerald Brooke,' he began in an impressive tone, 'since you allied yourself by some of the most solemn oaths possible for a man to take to that Sacred Cause to which I also have the honour of being affiliated.'

'Do you think that I have forgotten! At that time I was an impetuous and enthusiastic boy of eighteen, with no knowledge of the world save what I had gathered from books, and with a head that was full of wild, vague dreams of Liberty and Universal Brotherhood.'

'The fact of your becoming one of Us is the best of all proofs that the cause of Liberty at that time was dear to your heart.'

'But when as a boy I joined the Cause, I was ignorant of much I have learned since that time.'

'The world does not stand still. One naturally knows more to-day than one did eight years ago.'

'Karovsky, I know this—that the Cause, which, when I joined it, I believed to be so pure in its aims, so lofty in its ideas, so all-embracing in its philanthropy, has, since that time, been stained by crimes which make me shudder when I think of them—has dragged its colours through shambles reeking with the blood of those who have fallen victims to its blind and ferocious notions of revenge.'

'Pardon. But can it be possible that I am listening to one who, only eight short years ago, was saturated with philanthropic ideas which seemed expansive enough to include the whole human race—one whose great longing was that every man should be free and happy?—Ah, yes, you are the same—only time and the world have contrived to spoil you, as they spoil so many others. In those days you were poor; now you are rich. Then you had no fixed home; you were a wanderer from city to city; your future was clouded and uncertain. Now, you are the wealthy Mr Brooke—a pillar of your country: this grand old mansion and all the broad acres, for I know not how far around it, are yours. You are married to one whom you love, and who loves you in return. Away, then, with the wild notions of our hot youth!'

'Karovsky, you wrong me. My love of my fellows is as ardent as ever it was. My—— But why prolong a discussion that could serve no good end? You have a message for me?'

'I have.' The man was evidently ill at ease. He rose, crossed to the chimney-piece, took up one or two curios and examined them through his eyeglasses then went back and resumed his seat. 'Gerald Brooke,' he continued, 'eight years ago, on a certain winter evening, in a certain underground room in Warsaw, and before some half-dozen men whose faces you were not permitted to see, you, of your own free-will, took the solemn oaths which affiliated you to that great Cause for the furtherance of which thousands of others have given their fortunes, their lives, their all. From that day till this you have been a passive brother of the Society; nothing has been demanded at your hands; and

you might almost be excused if the events of that winter night had come at length to seem to you little more than a half-remembered dream. That you have not been called upon before now is no proof that you have been overlooked or forgotten, but simply that your services have not been required. Other instruments were at hand to do the work that was needed to be done. But at length the day has come to you, Gerald Brooke, as it comes to most men who live and wait.'

Gerald had changed colour more than once during the foregoing speech. 'What is it that I am called upon to do?' he asked in a voice that was scarcely raised above a whisper.

'You are aware that when an individual is needed to carry out any of the secret decrees of the Supreme Tribunal, that individual is drawn for by lot?'

'And my name?—'

'Has been so drawn.'

The light faded out of Gerald Brooke's eyes; a death-like pallor crept over his face; he could scarcely command his voice as for the second time he asked: 'What is it that I am called upon to do?'

'The Supreme Tribunal have decreed that a certain individual shall suffer the penalty of death. You are the person drawn by lot to carry out the sentence.'

'They would make an assassin of me?—Never!'

'You are bound by your oath to carry out the behests of the Tribunal, be they what they may.'

'No oath can bind a man to become a murderer.'

'One of the chief conditions attached to your oath is that of blind and unquestioning obedience.'

'Karovsky, this is monstrous.'

'I am sorry that things have fallen out as they have, *mon ami*; but such being the case, there is no help for it.'

'I—Gerald Brooke—whose ancestors fought at Cressy, to sink to the level of a common assassin? Never!'

'Pardon. Might it not, as well, before you express your determination in such emphatic terms, to consider what would be the consequence of a refusal on your part to comply with the instructions of which I have the misfortune to be the bearer?—Mrs Brooke is very young to be left a widow.'

'Karovsky!'

'Pardon. But that is what it means. Any affiliated member who may be so ill-advised as to refuse to carry out the decrees of the Tribunal renders himself liable to the extreme penalty; and so surely as you, Gerald Brooke, are now a living man, so surely, in a few short weeks, should you persist in your refusal, will your wife be left a widow.'

'This is horrible—most horrible!'

'Obedience, blind and unquestioning, the utter abnegation of your individuality to the will of your superiors, is the first great rule of the Propaganda to which you and I have the honour to belong. But all this you knew, or ought to have known, long ago.'

'Obedience carried to the verge of murder is obedience no longer—it becomes a crime. However you may put it, assassination remains assassination still.'

'Pardon.' We recognise no such term in our vocabulary.'

'Karovsky, had you been called upon to do this deed'—

'I should have done it. For if there be one man in the world, Brooke, whom I have cause to hate more than another, that man is Baron Otto von Rosenberg!'

'Von Rosenberg!'

'Pardon. Did I not mention the name before? But he is the man.'

For a moment or two Gerald could not speak. 'It is but half an hour since I parted from him,' he contrived to say at last. 'Karovsky, I feel as if I were entangled in some horrible nightmare—as if I were being suffocated in the folds of some monstrous Python.'

'It is a feeling that will wear itself out in the course of a little while. I remember— But that matters not.'

'But Von Rosenberg is not a Russian; he is a German ex-diplomatist. What can such a man as he have done to incur so terrible a vengeance?'

'Listen. Four years ago, when attached to the Embassy at St Petersburg, certain secrets were divulged to him, after he had pledged his sacred word of honour that no use whatever should be made of the information so acquired. Wretch that he was! Von Rosenberg turned traitor, and revealed everything to those in power. In the dead of night, a certain house in which a secret printing press was at work was surrounded by the police. Two of the inmates were shot down while attempting to escape. The rest were made prisoners, among them being three women and a boy of seventeen—my brother. Two of those arrested died in prison, or were never heard of more; the rest were condemned to the mines. On the road, my brother and one of the women sank and died, killed by the dreadful hardships they had to undergo; the rest are now rotting away their lives in the silver mines, forgotten by all but the dear ones they left behind.—You now know the reason why the Baron Otto von Rosenberg has been sentenced to death. The vengeance of the Supreme Tribunal may be slow, but it is very sure.'

There was silence for a few moments, then Gerald said: 'All this may be as you say; but I tell you again, Karovsky, that mine shall not be the hand to strike the blow.'

'Then you seal your own death-warrant.'

'So be it. Life at such a price would not be worth having. "Death before Dishonour" is the motto of our house. Dishonour shall never come to it through me.'

Gerald rose and walked to the window. His face was pale, his eyes were full of trouble; what he had said had been lacking neither in dignity nor pathos.

The Russian's cold glance followed him, not without admiration. 'English to the backbone,' he muttered under his breath. 'It was a blunder ever to allow such a man to become one of us.' Then he looked at his watch, and started to find it was so late. 'I can stay no longer—I must go,' he said aloud. 'But remember my last warning words.' He took up his hat and moved slowly towards the window.

'Karovsky, for the last time I solemnly declare that this man's death shall not lie at my door!' Gerald sank into a chair, let his elbows rest on the table, and buried his face between his hands.

'I have nothing more to say,' remarked the Russian. He stepped through the window, his hat in his hand, and then turned.

At that moment the door opened, and Mrs Brooke, on the point of entering the room, paused suddenly as her eyes took in the scene before her. 'Gerald!' she exclaimed in a frightened voice, and then her gaze travelled from her husband to Karovsky. The latter, with his eyes still resting on the bowed figure at the table, pronounced in low clear accents the one word, 'Remember!' Then he bowed low to Mrs Brooke, and next moment was gone.

(To be continued.)

RAILWAY GATEKEEPERS.

BY ONE WHO KNOWS THEM.

THE old axiom, that the strength of any chain is the strength of its weakest link, has many illustrations, and one may be found in the great chain of workers employed upon our various railway systems, the effective working of which systems depends upon the fitness and reliability of every link. One of these links, the importance and value of which are apt to be underrated by the general public, is the Gatekeeper at a public-road level-crossing, whose duty it is to open a gate whenever a vehicle has to cross the railway; a simple and prosaic act, requiring very little skill in its performance, and apparently entailing very little responsibility upon the incumbent of the office. But with all its apparent monotony and simplicity, the duty of a gatekeeper, in common with all other duties connected with the actual working of a railway, has its measure of responsibility, and is a matter of equal importance both to the railway company and to the travelling public.

Gatekeepers are perhaps the most nondescript class of railway employees; for while guards, signallmen, ticket collectors, shunters, &c., are recruited from among the porters, gatekeepers are drawn from no particular class, but are furnished by all classes indiscriminately, and sometimes the gatekeeper is a woman. The men who are employed as gatekeepers have always served the company in some other capacity, and no man is ever engaged as a gatekeeper who has not had some experience of railway work. In the majority of cases they are men who have received, in some other branch of the service, injuries which unfit them for any active duty requiring the use of all the limbs; while in some instances the gatekeeper has grown old in the company's service, and to such the gatehouse offers a well-earned and much-coveted retirement from active duty. Thus, while one crossing has for its guardian a man who as a guard has lost a leg, the next may have a shunter who has lost an arm; another may have a porter who has been crushed between trucks; and an adjoining gatekeeper may be a goods-porter worn out with hard work, or even an old station-master no longer able to cope with the increasing demands of a developing traffic.

Gate-crossings are broadly classed by railway managers under two heads—traffic crossings and engineers' crossings. At the former, a man is invariably employed who wears the uniform of

the company, and is under the immediate control and direction of the nearest station-master, being counted as one of his staff, and entered upon the station pay-sheet. He occupies a cottage, built by the company as near as possible to the crossing at which he is employed, and is usually provided with a wooden hut about eight feet square, placed close to the wicket gates through which pedestrians pass across the line, and furnished with windows, giving him a view of the railway in each direction. He is never off duty excepting when he takes his annual holiday, at which time he is temporarily replaced by a relief-man, who is sometimes a man specially appointed for the purpose, and continually employed in relieving gatemen who are sick or on leave; and at other times is a porter from the station, or occasionally a plate-layer. The engineers' crossings are those at which the traffic is not supposed to be sufficiently continuous to require the constant employment of a man to open and shut the gates; and here the gate cottage is occupied by a plate-layer who looks after the gates when he is at home; and whose wife looks after them during the day-time when he is away at work; they having the cottage rent free as remuneration for their joint services as gatekeepers.

Occasionally, a public-road crossing exists close to a signal-box, and then it falls to the signalman to attend to the gates, which in this case are interlocked with the signals; an arrangement which not only prevents the opening of the gates by any unauthorised person, but also prevents the signalman himself from opening them when the signals are lowered to allow the passing of a train.

Where a crossing is close to a station, but not close enough to the signal-box to allow of the signalman attending to the gates, a man is specially employed for the purpose; but the gates are still interlocked with the signals, so that the gateman can only open them by the signalman's permission, and when the signals are all up against approaching trains. This arrangement secures the public from any danger of being run over by a passing train while crossing the line, and at the same time secures the gates and train from damage by coming into contact with each other. It necessarily causes some delay to persons wishing to cross, and not unfrequently has a disturbing influence upon the temper of irascible people who are, or fancy that they are, in a hurry.

The gatekeeper at an ordinary crossing between stations is under no such control, and has no special warning of the approach of trains. He is supplied with a working time-table—not the neatly stitched pamphlet which is sold at the bookstalls, but a bulkier volume of more work-a-day appearance—a revised copy of which is usually issued on the first of each month—in which are entered all the passenger and goods trains running over the line, with the times of their departure and arrival at the various stations. In addition to this, he has usually every Saturday a supplementary time-table, giving information of the running of any special trains that have been arranged for the following week; and occasionally has in addition a special note of some train or trains that have been arranged at short notice.

Even with all this information in his hands,

or rather in his hut, the gatekeeper has to exercise considerable vigilance, as the exigencies of the service frequently necessitate the running of trains of which no notice beforehand can possibly be given to places not in telegraphic communication with headquarters. Usually, when a special train is run without notice, a tail-board—that is, a piece of sheet-iron, painted red—is hung on to the drawbar-hook of the last vehicle of the train immediately preceding the 'special,' and the gatekeeper carefully watches each train as it passes him, to see if it has a 'tail-board on.'

Nowadays, the size of the gates is determined by the Board of Trade, who require, in the first place, that they shall be of sufficient length to leave a clear public roadway between the posts twenty-five feet wide; and in the second place, that they shall shut right across both lines of railway, when the road is double; and that they shall not be nearer than four feet to the outside of the rail when closed for the passage of the train. Here and there, gates may be found which do not comply with those requirements; but they were erected before the Board of Trade took gates under their especial care, and as they require renewal are replaced with others of regulation size. The pattern of the gate and the material of which it is constructed are determined by the company's chief engineer, and each company has usually a standard pattern of its own. It is essential that the gate shall be strong enough to bear its own weight, which is by no means an inconsiderable item. It must be of sufficient height to prevent stock from jumping over it, and must be so designed as to prevent pigs, lambs, &c., getting through it on to the line. These conditions being complied with, the lighter it is made the better; for if an engine strikes a gate standing across the line, it will smash it whatever be its construction; and the lighter it is the less damage will it do to the engine striking it. Iron gates are for this reason not desirable, and are now seldom used.

Another resolution made by the Board of Trade is that upon the centre of each gate shall be fixed a disc of wood or iron some three feet across and painted red, in order that engine-drivers may see it from a distance; and also, upon one of each pair of gates a lamp, showing at night a red light both up and down the line. Each gate is fastened by a large bolt, which in its turn is secured by a padlock, to prevent the gate being opened by any one but the gatekeeper. This may appear at first sight an unnecessary precaution; but when the gatekeeper goes to bed, as even gatekeepers must, it would not do to leave the gates so that any one could open them; and where the gatekeeper is a woman, she usually locks the gates whenever they are shut across the public road.

In spite of all these precautions, gates do occasionally get broken, sometimes from sheer absence of mind upon the part of the gatekeeper, who has been known to shut one gate and forget all about the other until a train was too close to enable him to attend to the gate without danger to himself; sometimes through being closed when a train was due, which ran into them before they could be opened, but most frequently during foggy weather, when trains are apt to run somewhat irregularly, and can neither be seen nor very distinctly heard for any distance. Such damage is at once reported to the head of the department,

who, if the accident is due to carelessness, inflicts upon the offender a fine of a day's or two days' pay.

Each gatekeeper is supplied with a tricolour hand-lamp, some detonating signals, and two flags, one red, one green, in order to signal when necessary to approaching trains; for it does sometimes happen that a vehicle breaks down on the railway while crossing over it; and the prompt use of signals by the gatekeeper is necessary to prevent a train running into the obstruction and so causing a general smash-up. Not long since, at a crossing kept by a woman—the wife of a plate-layer—a load of straw broke down, blocking both lines, at a time when a passenger train was within ten minutes of being due. Away went the woman with her red flag to meet the approaching train, which she succeeded in stopping before it reached the obstruction; her presence of mind and prompt obedience to orders being suitably acknowledged by the company she served.

Other instances might be quoted in which the prompt action of the gatekeeper has prevented a temporary block from becoming a serious accident.

The relations of the gatekeeper to the public may be described as various, depending to a large extent upon the temperament and temper of both parties. Sometimes when the gentleman who wants the gates opened and the gentleman who has to open them are both of an irascible disposition, these relations are a little strained, and not unfrequently call forth some vigorous language from the occupant of the trap, which the man at the gate has to bear as best he may, well knowing that retaliation on his part would lead to his being reported and probably fined.

It is no doubt aggravating to a doctor or veterinary surgeon, for instance, with a long round before him and a skittish horse in the shafts, to have to wait seven or eight minutes because an express train is overdue; and equally aggravating to the gatekeeper to be told that his carefulness is simply crassness and the delay wilful and unnecessary. The belated traveller who at midnight finds his further progress barred by a locked crossing gate, the custodian of which requires a great deal of waking, can hardly be expected to greet with cheerfulness the advent of this guardian angel when he does come. Nor is it quite fair to blame the poor gatekeeper, wakened out of sleep perhaps for the third or fourth time, because he does not regard the traveller as a benefactor of his kind, more especially if Mr Traveller is a resident in the neighbourhood who has a habit of disturbing his slumbers at an unseemly hour. But, as a rule, the gatekeeper is popular with the residents in his neighbourhood; his previous experience has made him both careful and obliging; while from his chats with the people for whom he opens the gates, he is generally a well-informed authority upon all matters of local interest.

It sometimes happens in agricultural districts that a farm is divided into two portions by a railway running through it; and where the farm-buildings are thus separated from the bulk of the land, and the only or chief communication between the two is by means of a level crossing, a little forbearance has at times to be exercised by both parties, who, if they happen to disagree, can cause

each other considerable annoyance, as the following incident will show. A somewhat crotchety old farmer, whose land and buildings were on opposite sides of a level crossing, fell out with the gatekeepers, an equally crotchety old plate-layer and his wife; and whenever the woman's washing-day came round, the old farmer had always an extra amount of traffic over the crossing, which had a disturbing effect upon Mrs Gatekeeper, who sometimes gave him a long wait, on the plea that a train was due. Then the farmer hit upon the dodge of taking some stock across late at night, carefully waiting until the light was put out in the bedroom of the gatehouse before he raised the cry of 'Gate, gate!' continuing this practice sometimes for a week or two at a stretch, to the utter discomfiture of the gatekeeper, who had no alternative but to dress and obey the summons.

JOHN VALE'S GUARDIAN.

CHAPTER XLI.

FOR all that rather wild cordiality of his, Snelling never seemed to forget that he was a kind of grand seigneur among his guests. Isaiah and Mrs Winter had for years obeyed his orders; and Monsieur and Madame Vigne were people who, at least to his fancy, were so far beneath him socially that he was bound to have a patronising manner towards them. But Madame, at the suggestion of payment, put up hands expressive of such a stately negative, that he was a little abashed and disconcerted. He turned away, and saw Master Will in the act of slipping from the room.

'Hillo!' he asked, with a fierceness even more unexpected than his bonhomie had been; 'where are you going to?'

'I wasn't going anywhere in particular,' Will answered.

'Stop where you are, then,' said Snelling sternly. The arch below showed such evidences of his handiwork that it brought his heart into his mouth to think of the multitudinous chances which might lead to his exposure. Nobody so likely to go prowling round there as a boy, and nobody much more likely to proclaim what he had seen, though he had not the faintest idea of its purpose.

'That boy,' said Snelling, trying to force his voice back into a friendly tone, 'is the very imp for mischief. Such a bird's-nesting, high-climbing, limb-risking young rascal there never was before.—What was you going to be up to, eh?' He ruffled the boy's hair with forced hilarity; and Master Will got away from him, voicelessly resenting this familiarity, and more than half-suspicious of its meaning.

The mere hint of danger had set the would-be murderer's nerves at work; he feared detection everywhere, and felt as though a bird of the air might have carried the matter. 'Isaiah,' he said, 'you'll stop and have a cup o' tea, you and your missis, sence you're here.—If Mrs Vigne will join in, I shall be her grateful servant.—What d'ye say now, ladies? I can give you a very good cup o' tea, I believe. I drink no finer than my

own, wherever I happen to have the pleasure to sit down.'

Madame did not like her host, and would in all probability never have brought herself to like him; but she could not help a twinge or two of remorse as she thought how far she might have misjudged the man. She did not think him agreeable, and she thought that perhaps he might have been at once harsh and inconsiderate with the boy; but she had long acquitted him of the dreadful charge which Will Gregg had brought against him. The facts of the case had never been strong enough to support that terrible theory, and a boy's fancy was hardly evidence enough on which to hold it. So, altogether, Madame was willing enough to accept her old enemy's advances towards reconciliation.

'Yes,' she said. 'Thank you; I will drink a cup of tea with you with pleasure. I did not think to find you so friendly; but since it is so, I will gladly be the same.'

Somehow, Snelling's efforts to patronise Madame Vigne seemed to meet with less than their expected result. Even in the criminal whirl of all his thoughts, he hated her for her self-possession and the independence of her manner.

Snelling led the way down-stairs. The half-ruined flight led directly away from the arch, and his wicked handiwork was visible from no part of it. He marshalled all his visitors nervously away from the place, growing noisier in his affectation of good-fellowship. 'Queer old place for a lonely man to come and live in, this,' he said, addressing himself to Madame. 'I've cautioned John about it pretty often; but he's not a venturesome boy, like young Gregg yonder, or otherwise there might be some danger for him. I caught young Gregg the other day a-walkin' across that bit o' ruined wall there with a balancing pole, like a juggler at a fair. It turned my head giddy, and I was afraid to call out to him lest he should tumble.—Don't you ever let me catch you at them tricks, John. You recollect as the neck betwixt your head and your shoulders is the only one you've got. Learn to take care of it, my lad—learn to take care of it.'

There was not much accommodation for visitors in Snelling's house, and there was a good deal of laughter about the scarcity of cups and spoons. John and Will were sent into various apartments in search of chairs; and the party on the whole sat down rather jollily, though the host's loud gaiety was curiously fitful, and he was liable to moments of gloomy silence. Whenever these fell upon him, he roused himself with a great effort; but, excepting that his amiabilities were overstrained, as they well might be, considering the curious relationship of his visitors to himself, his manner passed unnoticed. As a matter of fact, the four elders were conscious of their own secret, and felt a little guilty over it. It is possible that their own mirth was a little forced, and that they felt somewhat ill at ease under Snelling's loud hospitalities. They were all tacitly helping to betray him; and though they were sure that they had right on their side, they were not altogether comfortable.

The summer day was drawing to its close, and the shadows were fast lengthening in the fields.

'Our pleasant day is over,' said Madame; 'and

it is time that we walk to the railway station.—That saves three miles, Mr Vintare, and for a person of my figure that is something.'

'Walk to my house, mum,' responded Isaiah gallantly, 'and I'll drive you back to the house in a brace o' shakes.'

'May I go with Madame Vigne, uncle?' John asked.

'Yes, yes,' his uncle answered; 'go if you like.—See you don't get into mischief.—Isaiah, you might come and smoke a pipe and have a bit o' supper with me to-night. I'm pretty lonesome here at times, I can assure you.'

'Thankee,' returned Isaiah. 'I don't mind if I do look in.'—After all, how should Snelling ever know that he had cashed the cheque which bought Jousserau's special license?

Since his discovery of the intruders upon his premises, Snelling had done nothing without a purpose. He thought it fortunate now that the pressure and hurry of his own thoughts had brought him home an hour or two earlier than customary. The visitors would be witnesses to one or two things which it was important to have established in the public mind. They would have to declare, if appealed to, that he had been on terms of perfect friendship with his ward. They would have to declare that the turret chamber was apparently quite safe.

He meant to finish his work that night. His plan was all made ready, and he had even invited Isaiah to supper that he might have one more witness to the purely accidental nature of the catastrophe which should overwhelm young John. Now that he was left alone, he sat down and thought it all out with a diabolic clearness.

He would have no flaw at all in the tale which should be told hereafter. It needed but a mere moment's work to clear away the bricks he had loosened, and that should be done at once. Then the building would hang merely by its own cohesion and by the support of one beam. He had examined it a hundred times, and was certain that when the support was removed a footstep would bring the whole place down.

But he must have his reason ready for sending his nephew into the chamber when he had completed his own share of the labour, and he knitted his brows to think it out. If any breath of suspicion should touch him later on, he must be able to justify himself at every step. It would never do to send John in search of an object which an after-search could not discover. It would never do, indeed, to send him at all; the boy must be made to volunteer.

Whilst he sat thinking thus, he was toying with his spectacle case, turning it over and over in his fingers and examining it with great apparent minuteness, as men will do with trifles at moments of great absorption. Suddenly he saw the thing consciously. That would serve perfectly. If he set this spectacle case in the turret room, and having done so, swept away the bricks he had already loosened, he would but have to mention the fact that he had left his glasses in John's hearing and the boy would volunteer.

It was growing dusk already, and Isaiah might well be expected back at any moment. 'Now was the time.' His ward's fortune, for which he had panted, yearned, and burned these two years past, was in his grasp. He rose quietly, took his hat,

and sauntered into the garden, hiding the spectacle case within his sleeve. He had neither ruth nor fear, and somewhat to his own surprise, was little interested. He had worked at his wicked task in such an agony that he had expected the last stroke of all to cost him an almost unspeakable pang; and now that he was actually about it, it cost him nothing.

He looked about him as he stood at the foot of the winding broken staircase, and assured himself coolly and collectedly that he was unobserved. Then he mounted, stepping carefully in the dim half-light, and came upon the chamber. Where should he set the case down? Surely at the far end of the room, where an intruder's weight would tell most. There was a table there beneath the window, and the placid sky with a hint of daylight still shining in it was sprinkled with a pale star or two.

He might have turned back even then and have saved himself. He thought so; but he had gone too far to turn. No man swims up the maelstrom's dizzy whirling slope. A single step forward and the floor swayed beneath him. There was a crack like the report of a gun, and then, with a score of noises, groaning, shrieking, rending, and rushing round him, the place was down.

CHAPTER XLII.

The miserable Tobias, with all thoughts of buried treasure shaken out of him, sat before the coroner for the southern division of the county.

'The last witness has told us that you were the one person found in the grounds of Tallymount Hall at the moment at which the building fell. Be good enough to tell us, if you please, what brought you there.'

'I meant no harm,' Tobias quavered.

'Your expressions at the time would seem to indicate that you were responsible for the fall of the building. You are not bound to say anything that may criminate yourself; but it is the business of this Court to make as full and complete an inquiry into the circumstances of the case as may be possible; and if you were there without a guilty intention, you cannot do better than tell the truth.'

'I saw Mr Snelling,' began Tobias, 'on two occasions doing something at the wall; he was dislodging the bricks, and I thought that something was buried there.'

'You thought there was something buried? Where?'

'In the wall.'

'Something of value?'

'Yes, sir; something of value.'

'What led you to that belief?'

'Mr Snelling looked anxious and disturbed, sir. He never worked more than a minute at a time, and would constantly leave the place to look about him. He worked in the archway, sir, and moved one brick at a time. When he had once got it free, he generally put it back again, and that made me wonder, sir, what he was doing.'

'When did you first begin to observe the actions you attribute to the deceased?'

'On the Thursday of last week. I was gathering firewood, and there is a hole in the wall. I showed it next day to Mr Winter, sir.'

'Come to the evening of the disaster. What brought you at that time in Mr Snelling's grounds?'

'I thought there was treasure hidden in the wall, sir.'

'Here is a plan of the building; show me where the deceased was at work. Now, on your oath, what was your belief as to the meaning of his action?'

'I thought he was looking for something.'

'And you went into the grounds—for what purpose? To see what the something was?'

'Yes, sir.'

'What did you do there?'

'I meant no harm, sir.—I hope the Court will believe I meant no harm.'

'What did you do there?'

'I took out the bricks Mr Snelling had loosened, sir.'

'Well?'

'That was all, sir.' The wretched man looked round the Court with a roving eye. The upper room of the inn was crowded—the inquest was held at the *Horns* at Quarley—and Shorthouse sat in a corner rubbing his nose with a tight-rolled copy of that day's newspaper. The members of the jury were all attentive; every eye was turned upon the witness.

'When you had taken out the bricks, what happened?'

'I heard a footstep, sir, and ran outside the archway.'

'Well?'

'The step went up-stairs, and the whole building fell.—I meant no harm, sir. I hope the Court will believe I meant no harm.'

'You say you first began to observe Mr Snelling's actions on the Thursday of last week, and that you were gathering firewood at the time. It is rather an unusual thing to gather firewood at the beginning of August.'

'I don't know, sir. I was putting by for a rainy day.'

'Tell me exactly what led you to the belief you profess to have had—the belief that Mr Snelling was looking for buried treasure.'

'He looked so anxious, sir. He was in and out of the archway every minute, looking about to see if anybody was coming. He spread a newspaper on the grass, sir, to catch all the little bits of mortar that fell from where he was working.'

'Were you aware that anybody used the room above the archway?'

'No, sir.'

'Did it occur to you to think that the stability of the whole of that part of the building depended upon the archway?'

'No, sir. I thought Mr Snelling would know best about his own house.'

'How long a time elapsed between the fall of the building and the time at which you were given into custody by the witness Winter?'

'I don't know, sir. Perhaps Mr Winter could tell that better than myself, sir. I am an elderly man, sir, and I have had a recent illness, and I was very much shaken by the melancholy event.'

'By what means did you obtain admission to the grounds?'

'I walked in at the gate, sir. I was not observed.'

'What right did you suppose you had to investigate the nature of the deceased's proceedings?'

'None, sir. I was animated by curiosity.'

'Quite simply, no doubt!'

'I thought there might be something to be made by it. I am an elderly man, sir, and I have known hardship.'

'Now,' said the coroner, 'I will read over to you the deposition you will have to sign. Is there anything you desire to add to that? Is there anything you desire to alter?'

'I should like to add that I am an elderly man, sir, and that I meant no harm.'

There was not much to go upon, and yet there was everything to go upon, and bit by bit the dreadful truth pieced itself together in the minds of the jury. They refused to return any other verdict than that the deceased died by the hand of God.

The truth which pieced itself together in the minds of the jurymen grew little by little in the mind of Farmer Shorthouse. He sat like a stone, and seemed neither to hear nor see, when once the truth had been brought home to him. The verdict was recorded; and the jury, splitting into scattered groups, whispered about the case, and filtered slowly from the room. The coroner packed up his papers and drove away. The public left the chamber in which the inquest had been held, and talked over the evidence in the bar and the bar-parlour. Farmer Shorthouse sat forgotten in his corner, until a barman, engaged for the day in anticipation of an increase of business, came into the room by accident, and made a great clattering of pots in order to awaken him. Then he rose and walked homewards without a word, and reaching his own house, sat down wordless in the kitchen for an hour or two.

The news of the general belief had reached Cecilia, and she moved about the house horror-stricken and silent. The great kitchen clock, which had always had a cheerful voice till now, ticked with a threatening ghostly tone in the middle of the stillness.

'Tea is ready, father,' said the girl. She had tried to find courage to speak to him a score of times before.

He looked up at her with a scared face.

'Tea is ready, father.'

'My wench,' said the old man slowly, 'it's no comfort to a father to say as much, but I've been an old fool. It's no fault o' mine as thee bist married to a murderer.'

'Don't speak of it,' Cecilia answered in a whisper, as if the time had been midnight and the theme an awful secret.

'I've done wi' whatever will I ever had i' that way,' said her father. 'Please yourself, my gell, and you'll never hear a word from me.'

The farmer, now shaken as to the stability of his own judgment, even as regards 'furriners,' referred of course to Cecilia's proposed marriage with the clever French artist, which soon became an accomplished event. The household of the Vignes rejoiced greatly, the more so that the boy John Vale, once again deprived of legal guardianship, found comfort and protection as formerly in the

arms of the warm-hearted Madame, under whose roof he took up his abode. Nor was his property unattended to, for it was Mr Winter's pride to give the lad the benefit of the long experience he himself had had of farming in the days before he purchased his 'steppers.' And so, in unrecorded peacefulness, their lives moved on.

THE END.

SALE BY CANDLE.

To sell by 'inch of candle' is an expression frequently to be met with in English writers of the seventeenth and the earlier part of the eighteenth centuries. It was customary in past times to sell goods, let land, and conduct auctions—or 'outcries,' as they were often then called—of all kinds of property 'by the candle.' When the company were duly assembled, the auctioneer lit a small piece of candle, generally an inch or less, and bids were received so long as the candle burned; the last bid before the flame expired securing the article or property offered. Sometimes a red ring was placed round the candle or taper at a certain distance below the flame, and the successful bid was the highest made before the ring was reached.

The custom appears to have been originally French; but it was in vogue in this country as early as the time of Charles I. It is mentioned in the records of the House of Lords in 1641. Milton, writing in 1652, as Secretary to the Council of State, says: 'The Council thinks it meet to propose the way of selling by inch of candle, as being the most probable means to procure the true value of the goods.' Pepys in his *Diary* notes the custom as being new to him, and under date November 6, 1660, records a keen competition at the sale of two ships by this method, when, he says, 'we have much to do to tell who did cry last.' On another occasion, nearly two years later, the diarist mentions a sale of some hulks, which he attended in his official capacity, when, he says, it was pleasant to see how backward men were at the first to bid, and yet when the candle was going out, how they bawled. The office of auctioneer under such conditions must have been almost as onerous, and have required as much nice discrimination as that of judge on a racecourse when the horses come past the winning post in such close order that, in sporting phrase, you might cover them with a tablecloth.

There is an advertisement in the *London Gazette* of 1684 of an unusual sale, which probably did not result in a very brisk fight for the last bid. The announcement was that 'on the 15th of March next will be exposed to sale by the candle two elephants, the one male, the other female. The price and places where to be seen and sold shall be notified by printed bills on the 5th of March.' The 'price' to be so notified was presumably the upset price fixed by the vendor; but what that was, or what the ponderous pair fetched, is not recorded.

The records of the East India Company mention, in 1690, the appointment of a special officer, a Mr Thorowgood, 'to manage the Company's candle at the sale.' These sales were frequently held in the coffee-houses. In the time of Queen Anne the most popular for the purpose were

Lloyd's and the Marine Coffee-houses. Towards the middle of the eighteenth century, the practice of selling goods in general by the candle seems to have practically died out in the country.

In France, the custom still exists in a modified form at public sales of real property. A Parisian *avocat*, writing to the *Times* in 1873, thus described the process: 'When the bidding is opened, a small candle—similar to a vesta—is lighted; at each bid a new one is lighted, and if no new bid is given before it goes out, a second, and on that going out without a bid, a third candle is lighted. The last bidder at the time the third candle goes out is declared the purchaser.' Much the same method is pursued in the far East. In a consular Report to the Foreign Office on the trade of Saigon and Cochinchina in 1878, it is stated that cultivated state land, or land bearing trees in full growth, is obtainable only at public sale, and that the auction is by candle, the dying out of three lights before a higher bid is made concluding the bargain. It seems highly probable, however, that this mode of sale is not of native origin, but has been introduced by the French.

In Burma, disputes are often settled by ordeals of various kinds. The ordeal by candle is in common use. Two candles, one for each litigant, of equal size and with wicks of equal thickness, are burnt on an altar or in a temple, and the disputant whose candle expires first is considered to have lost his cause. This method would appear to afford a considerable opening for bribery and corruption as regards the official in charge of the all-important 'dips.'

Up to a very few years ago, goods were publicly sold by candle every Friday afternoon at Bremen. The weekly auction was held in a room in the Exchange, and the presiding officer was assisted by a crier and a servant in a flame-coloured coat, who bore a box of little tapers, each of which was calculated to burn for the space of one minute. As soon as one of these was lighted, the bidding began. The candle was extinguished, and a new one lighted as each bid was made, until the light was able to burn itself out before the crier could announce a new bid. The goods offered then became the property of the maker of the last bid. The municipal authorities of Bremen abolished this ancient custom at the end of 1883. It was said that these sales had been held and the candles burned every Friday in Bremen for five hundred years without a break.

In the west of England, land is still let in a few places by this ancient method. The parish meadow of Broadway, near Weymouth, was stated a few years ago to be annually let with the old formalities. An inch of candle was placed on a board nine inches square, and was lighted by one of the parish officers, who then proceeded to take down the biddings. While the candle burned, any one could bid, and the last bidder before the light expired was the tenant for the ensuing year. A small plot of land and a cottage near Chedzoy, in Somerset, are put up to sale by half-inch of candle every twenty-one years. The land is known as 'Church Acre,' and the purchase-money is devoted to ecclesiastical objects. The amount realised by the last sale, which took place in 1884, provided a new clock for the church tower. In the little village of Tatworth, near Chard, also in Somerset, there is a small piece of land, a little

more than six acres in extent, which belongs to no one in particular; but its annual value is shared among certain property-holders in the neighbourhood. All entitled thus to share meet once a year at the village inn, when they style themselves a 'court,' and appoint a steward to conduct the letting. An inch of candle is solemnly lighted, the bidding begins, and according to the old rule, the last bidder before the candle goes out gets the field for the following year. The steward shares the rent amongst these entitled to receive it, and all present settle down for a convivial evening.

THE MONTH:

SCIENCE AND ARTS.

THE Hygiene Congress which recently met at Paris discussed among other subjects the important one of pollution of rivers, and passed some resolutions which we trust may meet with attention on the part of those in authority. It was recommended that the pollution of all streams by waste from factories should be forbidden absolutely, unless such waste can be proved to be free from injurious constituents; and it was stated that where such preventive regulations have been put in force manufacturers have benefited, for they have in many cases discovered residual products which are far too valuable to be thrown away. Irrigation was advocated as the best means of disposal of contaminated water, provided that such liquid could be so chemically treated as not to be injurious to agriculture. This water percolating through the ground would of necessity be subjected to a process of filtration and purification which could not be brought about by artificial treatment. The difficulty in applying these recommendations was chiefly found in dealing with those manufacturers who could not afford to undertake the necessary works, and in these cases the Congress advised that the authorities should themselves undertake the necessary alterations, and afterwards recover the cost from the persons concerned.

The French papers have recently described an invention which, if as effective as it is said to be, will mark an era in the history of small-arms. This is the substitution of a cartridge-case of vegetable substance for the brass shell generally adopted. The new cartridge-case is consumed at the moment of discharge, and entirely disappears, thus doing away with the necessity for any extracting apparatus. The weak point in the new device would seem to lie in the circumstance that the metal shell closes the powder chamber, and therefore for the time-being forms part of the weapon; but this difficulty is said to be obviated by an attachment to the gun which costs little, and which is easy of application to any weapon. The new cartridge is so much lighter than the metal arrangement which it replaces, that a soldier would be able to carry twice the number with which he is now provided—an advantage which is obvious now that the adoption of maga-

zine-rifles is only a question of time. We trust that these anticipations as to the merits of the new invention are not doomed to disappointment, but we confess that until we have more definite information concerning it, we have doubts as to its efficiency. For one thing, we know of no substance capable of instantaneous combustion which does not itself assume the character of an explosive, and such a substance would obviously be dangerous for storage when so closely allied with gunpowder.

The *Journal of the Franklin Institute* lately published an article by Dr Webster Fox with reference to some not generally known facts concerning the eyesight of children. He contends that a child's eye is far more sensitive to light than the eye of an adult, and that great mischief accrues from ignorance of this circumstance, a mother or nurse often leaving an infant exposed to the glare of the most intense sunlight. This practice may possibly injure the sight permanently, and very probably lays the foundation of absolute blindness. Dr Fox also tells us that the eyes should not be used for purposes of study until a child is between seven and nine years old, and that reading by artificial light should in no case be allowed until the child has passed his tenth year. We are glad to call attention to these sensible remarks at a time when the overtaking of children's intellects is a craze which is doing much harm, and when children who wear spectacles are almost as often seen as those without them.

Mr Henry J. Peddie, Edinburgh, has invented a new method of railway signalling which, properly carried out, would be instrumental in rendering collisions during fog impossible. The apparatus is in two sections, one part being attached to a shoe on the sleeper between the rails of the permanent way, and the other upon the engine. The former consists of a bar which is brought into such a position when the adjacent signals are at 'danger,' that it engages the apparatus on the engine, the result being that the whistle sounds, the steam is cut off, and the brake is applied; all these operations being carried out automatically, and without any interference of the driver. We cannot for want of space describe the ingenious manner in which all this is arranged for and brought about, but the system seems perfectly feasible. Like many another invention for saving life, it has the disadvantage that it cannot be adopted without great expense, and railway companies are slow to act in any way which reduces their dividends. Witness the fact that many lines are still without an efficient brake, an omission which should be regarded as 'culpable negligence' if loss of life should arise.

The ancient monuments of Egypt in the form of tombs, palaces, and temples have been built of such solid materials, and the absence of frost and atmospheric variations have so conduced to their preservation, that it would almost seem as if they were destined to last for ever. And so, perhaps, they might were it not for the cupidity of the Arabs, the thoughtlessness of tourists, and the greed of the collector. These between them have been doing their best to despoil the Egyptian monuments, and it has become necessary to take steps to stop them. The Society for the Preservation of Ancient Egyptian Monuments has

been formed with this object, and with the concurrence of the home and Egyptian governments. A report has already been made as to the cost of propping masonry which is in danger of falling, in clearing sites, &c.—the estimated expenses being about nine thousand pounds. This sum it is proposed to raise by subscription, when it will be applied to the immediate wants of about twenty of the more important monuments. When this work is done the Egyptian government will provide guardians who will look after the future well-being of the buildings under their care.

In the French technical journal, *La Nature*, there is described a steam-carriage for common roads, which will carry three passengers. It has a small boiler of the vertical type, which works at a pressure of one hundred and seventy pounds on the square inch, and evaporates about thirteen gallons of water per hour. The speed attained on a good road is fifteen miles per hour, and enough water can be carried to last for a run of twenty-five miles. The fuel (coke) costs one-third of a penny per mile. The entire weight of car, fuel, water, and passengers is twenty-two hundred-weight.

The exhibition of works by English humorists recently held in London was of a most interesting character in throwing light upon the manners, customs, and fashions of a bygone period. It is true that many of the caricatures were of ephemeral interest, so far as their original meaning was concerned, but at the same time they afforded valuable information as to details of dress, and the like, for the student of modern history. In one respect the artists in black and white have a great advantage over those who, like Leech, worked only a few decades ago. He and others had no choice but to draw their pictures direct on the wood block, the operation of engraving then in use destroying the original work. Nowadays, on the contrary, the original remains intact, for it is drawn on card, or paper, and reproduced as a photograph on the engraver's block. Periodical sales of original drawings of this character bring a handsome return to some of the large publishing houses.

The law in New York regarding the execution of criminals by electricity came into force at the beginning of the year; but there is a repugnance on the part of the authorities to enforce it. In the case of one criminal under the sentence of death, strenuous efforts have been made to avert his doom, by statements to the effect that death by electricity is uncertain, and partakes rather of the character of grievous bodily torture. Whereupon a reference commission was appointed to consider the entire question. Among the witnesses called before this commission was Mr Edison, who testified that the electric current could be applied in such a manner as to produce instant death. Such evidence was surely unnecessary when we remember the large number of fatal accidents which have occurred during recent years both in America and in this country.

Those who have watched the progress of aeronautical science, and are qualified to judge of the various schemes which have been proposed for navigating the air, have long ago come to the conclusion that the balloon is quite incapable of solving the problem. Nevertheless newfangled

machines on the balloon principle continue to be devised, and possibly it is a fortunate circumstance that a first trial often demonstrates their uselessness. A machine of this character—consisting of an egg-shaped balloon with attachments to its car in the form of vertical and horizontal propellers—rose from Brooklyn in July last in charge of an experienced aeronaut. The wind rapidly carried the machine in the contrary direction to which it was being steered; and in the end both the cumbersome contrivance and its foolhardy conductor were lost at sea. It is astonishing that any sane being can suppose that he will bend the wind to his wish—Canute's flatterers were not more foolish.

Professor Burton writing to a contemporary from Japan, calls attention to the extreme rarity of any houses in that country which can be called old. The frequency of earthquakes, of which there are some hundreds in every year, causes buildings of brick and stone to be slowly disintegrated—while those of wood succumb to the rarer and more violent shocks. The tinder-like character of the houses, and the circumstance that they are heated by charcoal fires and lighted by mineral oil lamps, are enough to ensure a conflagration after the earthquake has done the initial mischief. Hence it is that it is a most unusual thing to see a really old house in a Japanese town.

Among the wonders shown at the Paris Exhibition is an automatic portrait-taking machine, which is set in motion by the familiar device of dropping a coin into a slot provided for it. This done, the sitter takes his place in front of the machine, and fixes his eye upon a spot arranged for the purpose. A warning dial gives the instruction Attention, when a bell rings during the time of exposure, which lasts from three to six seconds, according to the light available at the time. (This time of exposure is estimated and regulated by an attendant.) In about five minutes a finished portrait emerges from the machine. The process employed (Ferrottype) is that which is commonly adopted by itinerant photographers at the seaside and elsewhere, and when we note the number of operations which it entails it would seem that they would be impossible without the aid of a skilled hand and eye. A thin enamelled iron plate has to be covered with collodion, sensitised, exposed, developed, dried and varnished. The machine is said to work well and efficiently—and, if this be the case, it will no doubt become well known. But it is obvious that it cannot compete in results with the ordinary and more simple method of taking a photograph.

The penny-in-slot principle has been applied to the ready sale of many articles of an unimportant character, but it has been reserved for the South-eastern Railway Company to utilise it in a manner which travellers will not be slow to appreciate. The modern railway-lamp burning gas is a great improvement upon the dim old oil-burner, which, to the shame of certain lines, is still retained. But the position of the light is generally too far away for comfortable reading. Recognising this inefficiency the company in question has provided some of their carriages with electric reading lamps, which, under the persuasive action of a penny dropped in a slot, will shed forth half an hour's radiance close to the reader's head.

A correspondent of the *Times* points out that edible fungi grow in great profusion in all parts of Ireland, and often close to the doors of peasants who rarely taste anything but potatoes. He also calls attention to the fact that no attempt is made in the schools of that country to acquaint the children with the differences which exist between edible and poisonous fungi. We fear that this objection would apply with equal force to other parts of Britain, and that a valuable form of food is neglected, because so few know what to utilise and what to reject. It is a common mistake that the mushroom is the only form of fungus which is fit to eat; there are many others which are both palatable and nourishing. Where these abound, the children in the schools should be made acquainted with them, and instructed how to prepare them for the table.

The *Pharmaceutical Journal* does well to point out that for killing rats, mice, and other small animals, the more dangerous poisons, such as arsenic, strychnine, &c., are not at all necessary. A comparatively inert substance, sulphate of barium, is an active poison to such creatures—although its precise action is difficult to explain, seeing that it is extremely insoluble. Powdered and mixed with lard or fat, it is readily partaken of by small animals, and will soon destroy them.

Some useful and interesting experiments have recently been carried out at the works of Messrs Frederick Siemens & Co., of Berlin, for the purpose of noting the loss of light which occurs through the use of different descriptions of window glass. A Bunsen photometer was employed for the tests, the source of light being two Argand gas-burners. A translucent but non-transparent glass showed a loss of twenty-seven per cent. of light. Next came cathedral glass, so much used now for decorative purposes. This was of the clear variety, with a slight tinge of colour, and showed a loss of twelve and two-thirds per cent. A ground glass with cut stars showed a loss of no less than sixty per cent.; and a new piece of ground glass, without any pattern, forty per cent. These facts should be borne in mind by those who wish to obtain the greatest amount of light from their windows, and they also prove the loss that must accrue from the common custom of using ground glass globes for lamps. Another point not touched upon by these experiments is worth noting, and that is, that glass becomes less transparent by age, and assumes at the same time a yellow tinge.

According to a note in the *Scientific American*, a somewhat strange course is adopted when a patient under chloroform shows the slightest symptom of failure of the heart's action. He is turned upside down with his heels in the air. So efficacious is this treatment considered by the doctors, that the operating tables in the Paris hospitals are so made that at any instant they can be elevated with one end in the air, so that the patient's head is on the ground. We presume that the explanation of the matter is, that the flow of blood is for a time changed in its direction.

The time lost under the present system of taking 'divisions' in the House of Commons and other public assemblies of a similar character is much to be deplored, and any method by which

that tiresome process can be simplified is worthy of attention. Such a method has for some time been under consideration by the French Chamber of Deputies, and, from a report upon the subject, we gather the following particulars. An apparatus has been devised by M. Le Goaziou which owes its motive power to electricity. On the desk in front of every member's seat is placed a box which is fitted with two handles—the one on the right registering 'aye,' and that on the left 'no;' while if both are moved simultaneously, it means that the member wishes to abstain from voting. At the same time, any member can, within an allowed period, recall or correct his vote. The results are exhibited on a receiver, and can be readily seen and brought to a total. The plan will thus be seen to be somewhat similar to the method of marking by electricity which is common to most modern billiard tables. The idea is good, although it is not new, for a similar method was proposed in this country some years ago.

M. Mallet recently exhibited to the Society of Physics and Natural History at Geneva two balls of almost perfect sphericity, which were formed naturally, but under unusual conditions. One of them of vegetable origin, and perfectly black, was found in the cavity of a piece of oak which had for a long period formed the shaft of a mill-wheel. As this shaft constantly rotated the cavity became charged with dust from the wood, and the moisture bound it together into one mass, which like a snowball constantly grew by added particles on its surface, until this black ball was formed. The other spherical curiosity was of mineral origin, and came from a grotto through which flowed a torrent from the river Rhone. It was a pebble with a calcareous coating, which had probably received its form from being constantly rotated in a hole in the rock by the action of water.

A new device for detecting and estimating the quantity of firedamp present in the airways of mines has been presented to the Royal Society by the inventors, Messrs Pitkin and Niblett. The apparatus consists of two thermometers, one of which has its bulb covered with platinum black, whilst the other is of the normal type, and is simply used for comparison with the first. When the instrument is placed in an atmosphere containing a hydrocarbon, such as firedamp, there is an increase of temperature in the blackened bulb owing to slow combustion of the gas in the pores of the finely divided platinum. The difference of height between the two mercurial columns then indicates the amount of gas present in the air.

THE MUSICAL SMALL-COAL MAN.

THE cry 'Small-coal!' 'Small-coal!'—as familiar to the ears of our great-grandparents as the homely tinkle of the muffin-bell to ours—has long since been hushed. For a century or more it has ceased to add its quota of discord to the medley of perambulatory jargon. It is a departed street-cry. We search our modern dictionaries in vain for its particular signification, but in Johnson we find: '*Small-coal*—Little wood-coals, used to light fires.' There were allusions to it in the *Spectator*

of palmy days, and in Gay's *Trivia*, where the poet sings:

When small-coal murmurs in the hoarser throat,
From smutty dangers guard thy threatened coat.

Among the itinerant vendors of this household requisite of the past was an extraordinary character—chemist, poet, musician, antiquary, all in one. His name was Thomas Britton, a native of Northamptonshire, who started life with a seven years' apprenticeship to a 'small-coal' man in London, at the end of which he returned to his native town of Higham-Ferrers, whence, having soon run through his little savings, he returned to the metropolis and set up for himself in the old line, hiring for the purpose a stable in Clerkenwell, which served him in the twofold capacity of store and dwelling-house. After being settled in business for some little time, he made the acquaintance of his neighbour, Dr Garaniere, a celebrated chemist, who, taking a decided interest in the young man, allowed him free access to his laboratory, of which privilege Britton took such advantage that before long he vied with his patron, built himself a movable laboratory, where, according to Hearn, with whom he was a great favourite, 'he performed with little expense and trouble such things as had never been done before.'

Britton was also passionately fond of music, and in the miserable loft over his coal-store, the only access to which was a narrow breakneck pair of outside wooden steps, he established regular concerts, at which he himself performed on the viol-de-gamba. The annual subscription to these musical entertainments was ten shillings, at which Britton found the instruments and regaled his fellow-artists with coffee at a penny a dish; and in spite of the rudeness of the accommodation, his humble roof was frequented by assemblies of the fair and the gay. Many of the leading professionals, including the aristocratic Handel, it is said, took part in the performances; and it was here that Dubourg, when a child, played, standing upon a joint-stool, the first solo that he ever executed in public. Steele, in No. 144 of the *Guardian*, commenting on the odd and original characters produced by a free form of government, says: 'We have a small-coal man, who, beginning with two plain notes, which made up his daily cry, has made himself master of the whole compass of the gamut, and has frequent concerts of music at his own house, for the entertainment of himself and friends.'

Old-book stalls had an extraordinary fascination for the man. On his daily rounds he would spend more than half his time poring over antiquated works on chemistry and music; and so great was his discernment in the selection of works of merit, that during the rage for old books and manuscripts that set in at the beginning of last century, he was employed to swell the collections of many of the noblest in the land, including the Duke of Devonshire, the Earls of Oxford, Sunderland, Pembroke, and Winchelsea, who allowed him to share in their conversations, when they met to compare notes at a bookseller's shop in Ave Maria Lane after their rambles through the town. Britton would leave his coal-sack at the door, and, dressed in his blue frock, spend many an agreeable hour with his co-enthusiasts. He

himself amassed a splendid collection of musical works, to which he continually added manuscripts copied with his own hand. But he did not confine his attention solely to music and chemistry; he was a collector of 'curios' of all sorts, drawings, prints, ancient and modern musical instruments, as well as treatises on such uncommon subjects as the philosopher's stone, judicial astrology, mystic divinity, magic, &c. At his decease his books and manuscripts were sold by auction at Tom's Coffee-house, near Ludgate, many being purchased by Sir Hans Sloane, which are now in the British Museum; his collection of music alone fetched nearly one hundred pounds.

Poor Britton's end was very sad, and strangely in keeping with his singular life. Whether it was that his head had been turned by his mystical and magical books, he was killed to all appearance by imagination. A jesting friend one day introduced into his company a ventriloquist, who, in a far-away voice, bade poor Britton prepare for his approaching end by repeating the Lord's prayer on his knees. He obeyed the injunction, went home to bed, and died a few days after, September 1714, and was buried in Clerkenwell.

Among those who took frequent part in his concerts was the painter Woolaston, a good performer on both violin and flute, who twice painted him, one of the pictures being now in the British Museum, having been purchased by Hans Sloane. Woolaston was a staunch friend to Britton, and stood by him when at different times he was accused of being an atheist, Presbyterian, and Jesuit, and when his musical assemblies were suspected by some of being a cloak for seditious meetings or magical *séances*. Woolaston, who knew him well, pronounced him a plain, simple, honest man, solely bent on amusing himself. All the print-shops of the last century exhibited mezzotintos of this remarkable man, in which he was represented with a sack of small-coal over his shoulder, and his retail measure in his hand, subscribed with the following appropriate lines by Hughes, another member of his orchestra:

Though mean thy rank, yet in thy humble cell
Did gentle peace and arts, unpurchased, dwell;
Well pleased Apollo thither led his train,
And music warbled in her sweetest strain.
Cyllenius so, as fables tell, and Jove,
Came willing guests to poor Philemon's grove.
Let useless pomp behold, and blush to find
So low a station, such a liberal mind.

CARBOLINE.

The introduction of transparent wire-wove roofing, which some little time since was noticed in our columns under the title of a 'New Substitute for Glass' (February 2, 1889), has met with such a marked degree of success, that its promoters—the Wire-wove Roofing Company, 16A Queen Victoria Street, London—are now placing on the market a new material, to which the name of Carboline has been given, similar in many respects to that already described, but opaque and considerably cheaper. Carboline forms an excellent substitute for slates, tiles, corrugated iron, or any of the usual substances used for covering roofs where light is not required; and may also be employed

at greatly reduced cost in place of enamelled iron plates for advertising purposes, in which branch alone an enormous business should accrue to the new material. Carboline being only about one-third the weight of galvanised iron, an obvious saving in the cost of carriage, freight, &c. results; whilst the structure to be roofed in, having a lesser weight to carry, can be correspondingly reduced in strength with a resultant economy in building material.

Further advantages claimed for the new substance under consideration are extreme cheapness, whilst forming a roofing material cool in summer and warm in winter. Being, moreover, unlike galvanised iron, a non-conductor, it is free from noise, a desideratum of no mean importance.

Carboline can be fixed with ease and rapidity by unskilled labour, and possesses all the advantages, save translucency, of the transparent wire-wove roofing, whilst costing considerably less. It is waterproof, unaffected by steam, sun, heat, frost, hail, snow, or ruin, and is tough, elastic, and unbreakable.

In conclusion, it may be added that the British War Office, after experimenting with carboline, has ordered a large additional quantity for covering soldiers' huts, a purpose for which it is eminently adapted.

A L T A R A N D G R A V E.

By DR CHARLES MACKAY.

THE spring-time loveliness decays
Ere the cold autumnal days;
The petals of the lily
Fade ere the night grows chilly,
And roses droop before the year grows old,
And the gay greenery turns to russet gold;
And such, alas! is living beauty's doom
When age creeps over it to blight its bloom.

But the calm beauty of the sacred dead,
Lost to our hearts in life's young prime,
Remains for ever in our silent thought,
With tenderest recollections fraught,
Defiant of the touch of time.
Although the hostile seasons pass,
Fond memory's magic glass
Preserves the lovely features unimpaired,
And adds angelic grace
To the beloved face,
Preserved by Death, though Life might not
have spared.

** TO CONTRIBUTORS.

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
 - 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
 - 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
 - 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.
- If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

AN OLD ROMAN GARDEN.

NOTHING but the soothing sense of silence! Far, far away rise the distant snows of the Alps, which, as the splendours of the living day decline, are shrouded in the twilight mists of earth. Nestling in sea-gray olive woods, the lower hills creep into prominence, golden-tinged, red, brown, silvery gray, with the warm Venetian tints of the million-hued roofs of Nice. Peeping from between the dark-stemmed silvery foliage and the flowering Judas trees, down where the tideless waters lap the porphyry shores, the low brown eaves of cottage roofs huddle together. A belt of purple cloudland marks the spot where sea and sky fade into eternity. A few fleecy clouds sail across the blue vault, like ships full rigged; and the puff of scented air wandering over the citron and orange groves gives promise of rain, to soften the air, and moisten the lips of the flowers, which are already beginning to carpet the earth beneath the vines and olives. Violets white and purple raise their scented heads; hypanthias and scarlet anemones star the ground with many a brilliant fleck of colour. Buttercups and daisies there are in plenty; but one looks in vain for the precursor of summer, the faint sweet primrose.

The rambling old Garden is walled in with a dike of uncertain age, largely composed of the veritable stones which went to build the fine old Roman baths and Temple of Apollo, which now lie by in melancholy grandeur. Bits of marble, rosy and white, are intersected; and on sunny mornings the lizards run over the warm surface of the stones and in and out of the mossy crevices. A glorious growth of ivy crowns the summit of the wall; depending, hang the clusters of rich purple berries, with the bloom full upon them. From the niches spring lovely specimens of the hard fern, polypodium, and maiden-hair, spleenwort, also a variety of bracken, said to be indigenous to the Roman ruins, which fills every fissure of the dry rock and wall.

What chapters could be written on this long low pile of stones, with the tangled wealth of foliage, its myriad living inhabitants, its ancient marbles, each a landstone marking the centuries! Hard by are the ruins of the Temple of Apollo. The recesses that once held the sculptured figures, alas! are now empty. The old doorway has been blocked up with mortar, and the interior, once sacred to the god of beauty, is now the home of the gardener and his family. The low doorway shows the walls of solid masonry to be about four feet thick. Above the lintel, on a marble ledge, a vigorous growth of mountain polypody hangs a green fringe almost into the apartment.

Entering, we find ourselves in a large bare living-room. The dark-raftered ceiling and walls are smoky embrowned, like an interior of Rembrandt's, with its play of light and shadow, sunshine and flickering firelight. A wide old chimney occupies one end; and looking up, the blue sky is seen shining above. A narrow stone stair, chipped and broken, built in the thickness of the wall, and having at each side a curious old-fashioned cupboard, leads up to the roof. The trained and trellised vines make a temporary covering of green, where once a vaulted stone roof has been. A low uneven parapet of ruined masonry, fern-grown and yellow with lichens, guards the edge. Here a rough wooden table is piled with homely utensils, waiting to be washed: a green pipkin—from which rises a great silvery pigeon—dark rich shades of brown and yellow jars of baked clay. The water is drawn from a very deep well that descends from the roof, and is protected by a broken marble edge. An old wooden pail, attached to a rusty chain, draws up the water, which is sweet and pure. As we look down into its dark-brown depths, the stone walls are seen to be covered thick with the graceful fronds of loveliest maiden-hair, such as many a gardener can never produce in an English greenhouse. In the clear depths, the living stalactites depend in feathery tufts down until their green fronds touch the silent water.

Several cages of birds are hung out, to catch the sun, shimmering between the canopy of leaves: two canaries in one tiny cage—greenfinches; in another, a captive thrush singing in the sunny glory. A little wooden door leads down two steps into another apartment, used by the gardener's daughter. Here in a corner stands what once must have been a very fine old Louis Quatorze cabinet, with its painted figures and stiff prim shape, the gilding tarnished, the painting faded, and the wood rotten with long exposure to the damp, and the relentless maw of worms. From what can be gathered from the local patois, with its soft Italian termination, it was removed from the big house upon its being closed, many years ago, when Count Garin ceased to live in the quaint old villa, now converted into an English *pension*. The whole place has a sad air of worn-out faded grandeur, once the scene of Roman magnificence and ostentatious worship. In the old-world Garden, a pigeon-house has been formed from a portion of the ruins, where the iridescent birds preen themselves in the sunny luxuriance, and rows of dried gourds hang in the glowing warmth.

About a stone's-throw off lie the Roman baths. A few relics, saved from the ruthless hands of the tourist, are piled up in a corner—a broken jar or two, a carved stone, a sculptured pillar's base, a handle torn from some stately urn, one or two slabs of rosy marble. Poor stately remains! all that is left of Roman pomp—of the flourishing Roman city, Cimiez, that took the part of Caesar against the infatuated Antony and Egypt's Cleopatra. Looking down on the gaunt amphitheatre, which seated eight thousand spectators, vividly come crowding upon the mind scenes of the dying gladiators and condemned serfs. Here the Roman dames mixed with the populace in the arena, and courted the applause which a sterner republic deemed only fit for slaves.

A little to the east rises a huge plateau, crowned with ruined walls, stately ilexes, ancient olives, which, for age and grandeur, might be the contemporaries of those that clothed the Mount of Olives. The ruins once constituted the house of the Roman Proconsul, razed to the ground when Cimiez in the sixth century fell before the Lombards, who burned and sacked houses and temples, slaughtering without mercy men, women, and children, the few who escaped finding refuge in Nice.

The mansion-house is approached by an avenue of elms ivy-clad and gaunt. A cluster of giant cypresses raise their proud dark plumes towards the cloudy dome. There is no rustle and sway so mournful, nor yet so grand, as the melancholy dirge of the stately cypress. Close by the door lie the sculptured bases of two white marble Corinthian pillars; and under the heavy purple shadow of the tree of death lies an old stone coffin with a handsome carved stone cover. In one corner the carving has been broken off, and one can see into the damp mossy cavity, which once contained all the earthly remains of some noble Roman, laid to sleep there hundreds of years ago under its cover of carved stone.

A glass door opens into the vaulted hall, supported by old stone pillars. Around are ranged quaint stone pedestals, which probably once

held statues taken from the principal gate of ancient Cimiez. On the walls hang several ancient pictures by Italian artists: 'The Adoration of the Shepherds,' 'The Birth of Christ,' the sky gilded, and the heads golden haloed. Up the wide old staircase the echoes seem to linger amongst the marble pillars and balustrades. Several old engravings of value still rest on the walls. At night, when the household are asleep, the solitary watcher may hear a curious chopping sound, which lasts from midnight till dawn, and the oldest inhabitants will tell you it is the ghostly visitant who haunts the Villa Garin, and chops wood in the silent hours.

From over the shadow-lands come the odour of budding citrons and orange gardens, and a world of violets filling the woods. A lustre of purple and gold streams over the Estrelles, and blends with the hazy vapours hovering around the olive-clad hills. The soft chimes of the Ave Maria ring out from distant chapels. The solemn tones chant out from the adjoining Franciscan monastery, calling the monks to vespers. Shadowed over by stately ilexes stands the old Gothic marble cross supporting the winged seraphim who appeared to St Francis; and above is the pelican feeding her young—symbol of Christian charity in the Middle Ages.

Whitewashed walls line the stone passage leading to the old well and court built by the Benedictines in the sixteenth century. Many old prints hang round, illustrative of the lives and legends of the saints. A stone passage leads to the Chapel, a vast echoing, gloomy space, built in Basilica form, whose walls once formed the Temple of Diana dating from the first century. There hang several paintings of note by Ludovico Bren, of sixteenth-century fame, and many curious mystic symbols of monastic times. A friendly monk leads the way to the sacristy, lined with frescoes by a Venetian, on into the choir, the seats lining the wall ornamented by finely carved old chestnut wood; and there, three times a day, come the brown-robed monks to pray. In the centre of the apartment, where the masses of shadow are penetrated by the primrose gloaming creeping through the narrow windows, and stealing to the solemn gloom of the vaulted roof, stands the gigantic lectern, of carved chestnut, from which the great old book can be read by all around. From a worm-eaten cabinet, shelved, and filled with sixteenth-century manuscripts, the old monk extracts some old brass-clamped books, and resting them on the time-worn carvings, displays the rich illuminations and quaint calligraphy of the sixteenth century. The vellum is stiff to the touch, and gorgeous with diverse blended colours and gilding; the bindings rich, handsome, and lasting, of finest brown leather, with huge brass bosses and nails; massive brazen clasps keeping the whole firmly together. On the front of the altar in the sacristy stands a beautiful crucifix, the cross ebony, the Christ an exquisite piece of old ivory carving, the base of buhl—the whole comprising a beautiful piece of workmanship. At either side stand obelisk-shaped glass jars, each containing the mouldering bone of a departed saint.

Alongside the Chapel stretches the crowded graveyard, a dangerous spot for malaria as the

evening mists creep up from the river. A glance through an open door shows a trim garden—in which, thanks to Mother Eve, no female foot may enter—and a dreamy vista of far-off snows. The faint tinkle of bells comes from a distant team of patient mules. One mournful and grand Kyrie Eleison is chanted by the murmuring voice of many waters. A beauty not of land or sea hovers over the scene, half-paradise, half-sepulchre; while an old monk, sandal-footed, brown-robed, with tansured head sunk upon his breast, and wrinkled hands crossed upon his girdle of knotted rope, paces beneath the ilexes, under the shadow of that home for which he has counted the world well lost.

A DEAD RECKONING.

By T. W. SPEIGHT.

CHAPTER V.

TEN weeks had come and gone since the memorable visit of M. Karovsky to the master of Beechley Towers. It was a pleasant evening towards the end of June. There had been a heavy shower a little while ago; but since then the clouds had broken, and the sun was now drawing westward in a blaze of glory. In the same pleasant morning-room in which we first made their acquaintance, Mrs Brooke and her aunt, Miss Primby, were now sitting. The latter was dozing in an easy-chair with a novel on her lap, the former was seated at the piano playing some plaintive air in a minor key. The glad light, the light of a happiness that knew no cloud, which shone from her eyes when we saw her first, dwelt there no longer. She looked pale, anxious, and *distracted*, like one who is a prey to some hidden trouble. She had spoken no more than the truth when she said that her happiness was too perfect to last.

As the last sad note died away under her fingers she turned from the instrument. 'I cannot play—I cannot work—I cannot do anything,' she murmured under her breath.

At this juncture Miss Primby awoke. 'My dear Clara, what a pity you did not keep on playing,' she said. 'I was in the midst of a most lovely dream. I thought I was about to be married; my wreath and veil had been sent home, and I was just about to try them on; when you stopped playing and I awoke.'

'If I were to go on playing, aunt, do you think that you could finish your dream?'

'No, my dear, it's gone, and the chances are that it will never return,' said the spinster with a sigh.

Clara crossed the room, and sat down on a low chair near the window, whence she could catch the first glimpse of her husband as he came round the clump of evergreens at the corner of the terrace.

'I wish you would not mope so much, and would try not to look quite so miserable,' said her aunt presently.

'How can I help feeling miserable, when I know that Gerald has some unhappy secret on his mind, of which he tells me nothing? He has been a changed man ever since the visit of M. Karovsky. He cannot eat, he cannot rest;

night and day he wanders about the house and grounds, like a man walking in his sleep.'

'Bad signs, very, my dear. Married men have no right to have secrets from their wives.'

'If he would but confide in me! If he would but tell me what the secret trouble is that is slowly eating away his life!'

'I remember that when the Dean of Rathdrum leaned over the back of my chair, and whispered "My darling Jane, I"—'

'Here comes Gerald!' cried Mrs Brooke. She started to her feet, while a glad light leapt into her eyes, and ran out on the terrace to meet him. 'What a time you have been away!' she said, as he stooped and kissed her. 'And your hair and clothes are quite wet.'

'It is nothing,' he answered. 'I was caught in a shower in the wood.'

'Poor fellow! He certainly does look very haggard and dejected,' remarked Miss Primby to herself.

'Have you been far?' asked Clara.

'Only as far as Beaulieu.'

'You called on the baron, of course.'

'No. I changed my mind at the last moment.'

'The first bell will ring in a few minutes.'

'I have one important letter to write before I dress.'

'Then aunt and I will leave you. You will not be long? I am so afraid of your taking cold. Come, aunt.'

'Nothing brings on rheumatism sooner than damp clothes,' remarked Miss Primby sententially, as she folded down a leaf of her novel, and tucked the volume under her arm.

Then the ladies went and Gerald was left alone. He looked a dozen years older than he had looked ten weeks previously. All the light and gladness had died out of his face; he had the air of a man who was weighed down by some trouble almost heavier than he could bear. 'She is afraid of my taking cold,' he said to himself, with a bitter smile as his wife closed the door. 'Poor darling! if I were to take cold and have a fever and die, it would be the best thing that could happen either to her or me.' He began to pace the room slowly, his hands behind him, and his eyes bent on the ground. 'Nearly three months have passed since Karovsky's visit, and nothing has yet been done. Only two more weeks are left me. Coward that I am, to have kept putting off from day to day doing that which I ought to have done long ago. Even this very afternoon, when I reached Beaulieu, I had not the courage to go in and confront Von Rosenberg. My heart failed me, and I turned back. If I have begun one letter to him I have begun a dozen, only to burn or tear them up unfinished; but now there is no time for further delay. I will warn him that if he wishes to save his life he must leave here immediately, and seek some asylum where his enemies will be powerless to harm him. Shall I vaguely hint at some shadowy danger that impends over him? or shall I tell him in plain terms why and by whom the death sentence has been recorded against him? Shall I write to him anonymously, or shall I sign the letter with my name? Better tell him everything and put my name to the letter; he can then act on the information in whatever way he may deem

best. In doing this, as Karovsky said, I shall be sealing my own doom. Well, better that, better anything than the only other alternative.'

He halted by one of the windows, and stood gazing out at all the pleasant features of the landscape he had learned to know and love so well. 'It seems hard to die so young, and with so much about me to make life happy,' he sadly mused. 'I think I could meet my fate on the battle-field without a murmur—but to be murdered in cold blood—to be the mark for some stealthy assassin! Poor Clara! poor darling! what will you do when I am gone?' He sighed deeply as he turned from the window. His eyes were dim with tears.

Presently he seated himself at the davenport, and drew pen and paper towards him. 'No more delays; this very night the baron shall be told. But how shall I begin? in what terms shall I word my warning?' He sat and mused for a minute or two, biting the end of his pen as he did so. Then he dipped the pen into the inkstand and began to write: 'My dear Baron, from information which has reached me, the accuracy of which I cannot doubt, I am grieved to have to inform you, that your life is in great and immediate peril. You have been sentenced to death by the Chiefs of one of those Secret Societies of the existence of which you are doubtless aware. Your only chance of safety lies in immediate flight.'

'What shall I say next?' asked Gerald of himself. 'Shall I tell him that'—

But at this juncture the door was opened, and Mrs Brooke came hurriedly into the room. 'O Gerald, such terrible news!' she exclaimed, breathlessly.

Gerald turned his letter face downward on the blotting-pad. 'Terrible news, Clara?' he said in a tone of studied indifference. 'Has your aunt's spaniel over-eaten itself and'—

'Gerald, don't!' she cried in a pained voice. 'Baron von Rosenberg is dead—murdered in his own house less than an hour ago!'

Gerald rose slowly from his chair as if drawn upward by some invisible force. The sudden pallor that blanched his face frightened his wife. She sprang forward and laid a hand on his arm. He shook it off almost roughly. 'Tell me again what you told me just now,' he said in a voice which Clara scarcely recognised as that of her husband.

She told him again. 'Murdered! Von Rosenberg! Impossible!'

'Dixon brought the news; he has just ridden up from King's Harold.'

Gerald sank into his seat again. His eyes were fixed on vacancy. For a few moments he looked as if his brain had been paralysed.

Miss Primby came bustling in. 'Oh, my dear Clara, can it be possible that this dreadful—dreadful news is true?'

'Only too true, I am afraid, aunt.'

'Poor Baron! Poor dear man! What a shocking end! I never knew a man with more charming manners. Cut off in the flower of his age, as one may say.'

'Perhaps, dear, you would like to see Dixon and question him,' said Clara to her husband.

He simply nodded. Mrs Brooke rang the bell and Dixon the groom entered. 'You had better

tell your master all you know about this frightful tragedy.'

The man cleared his throat. Gerald stared at him with eyes that seemed to see far beyond him—far beyond the room in which they were. 'I had been down to King's Harold, sir,' began Dixon, 'to see Thompson, the farrier, about the chestnut mare, and was riding back, when just as I got to the Beaulieu lodge-gates I see the dog-cart come out with Mr Pringle the baron's man in it, along with Dr King, and another gent as was a stranger to me. Seeing the doctor there, and that Mr Pringle looked very white and scared like, I pulls up. "Anything amiss, Mr Pringle?" says I, with a jerk of my thumb towards the house, as the dog-cart passed me. But he only stared at me and shook his head solemn like and drove on without a word. Then I turns to the lodge-keeper's wife and sees that she has her apron over her head, and is crying. "Anything serious amiss, mum?" says I. "I don't know what you calls serious, young man," says she, "but my poor master, the baron, was found murdered in the little shally in the garden only half an hour since—shot through the heart by some blood-thirsty villain." I didn't wait to hear more, sir, but made all the haste I could home.'

No word spoke Gerald. The man looked at him curiously, almost doubting whether his master had heard a word of what he had said.

'Thank you, Dixon; that will do,' said Mrs Brooke. 'The man carried a finger to his forehead and made his exit.'

'Poor dear baron!' remarked Miss Primby for the second time. 'There was something very fascinating in his smile.'

'Clara, tell me,' said Gerald presently. 'Am I in truth awake, or have I only dreamt that Von Rosenberg is dead?'

'How strangely you talk, dear. I am afraid you are ill.'

'There you are mistaken. I am well—excellently well. But tell me this: ought I to feel glad, or ought I to feel sorry? On my life, I don't know which I ought to feel!'

'Glad? O Gerald!'

'Ah; I had forgotten. You don't know.'

'You no longer confide in me as you used to do.'

He took no notice of the remark. "Let the Dead Past bury its deal," he said aloud, but speaking exactly as he might have done had he been alone. 'No need to send this now,' he muttered in a lower tone as he took up his unfinished letter. 'If I had but sent it a week ago, would Von Rosenberg be still alive? Who can say?' Crossing to the chimney-piece, he lighted a match and with it set fire to the letter, holding it by one corner as he did so. When it had burnt itself half away he began to whistle under his breath.

'O Gerald!' said his wife in a grieved voice.

'I had forgotten. Pardon—as Karovsky would say.'

'I am grieved to say so, dear, but his brain seems slightly affected,' whispered Miss Primby to her niece. 'If I were you I would call in Dr Preston.'

Before Clara could reply Bunce came in with a lighted lamp half turned down. He left the curtains undrawn, for a soft yellow glow still lingered over field and woodland.

As soon as he had left the room Mrs Brooke crossed to the couch on which her husband had seated himself, and taking one of his hands in hers, said: 'Dearest, you must not let this affair, shocking though it be, prey too much on your mind. It is not as if you had lost an old and valued friend. Baron von Rosenberg was but an acquaintance—a man whose name even you had never heard six months ago.'

His only reply was to softly stroke the hand that was holding one of his.

Clara waited a little and then she said: 'Will you not come and dress for dinner?'

He rose abruptly. 'Dress for dinner!' he exclaimed with a strange discordant laugh. 'How the comedy and tragedy of life jostle each other! Grim death claps on the mask of Moinus and tries to persuade us that he is a merry gentleman. Here a white cravat, a dress coat, the pleasant jingle of knives and forks. There, a pool of blood, a cold and rigid form, a ghastly face with blank staring eyes that seem appealing to heaven for vengeance. Yes, let us go and dress for dinner; for, in truth, you and I ought to rejoice and make merry to-night—if you only knew why.'

'Gerald, you frighten me.'

'Nay, sweet one, I would not do that; he answered as he drew her to him and kissed her. 'I am in a strange humour to-night. I hardly know myself. I could laugh and I could sing, and yet—and yet—poor Von Rosenberg!' He turned away with a sigh.

At this moment in came Mr Bunce again. 'If you please, ma'am,' he said to Mrs Brooke, 'here's a strange young pusson come running to the Towers all in a hurry, who says she must see you without a minute's delay.'

The 'strange young pusson' had followed close on his heels. 'Yes, mum, without a minute's delay,' she contrived to gasp out, and then she stood panting, unable to articulate another word. She was breathless with running.

'Well, if ever!' exclaimed the scandalised Bunce, turning sharply on her. 'Why, you ain't even wiped your shoes.'

'That will do, Bunce, thank you,' said Mrs Brooke with quiet dignity.

Bunce sniffed and tried to screw up his nose further than nature had done already. 'Sich muck!' was his comment to himself as he left the room.

The person to whom this depreciatory epithet was applied was a girl of some sixteen or seventeen summers, Margery Shook by name, who was dressed in a coarse but clean bib and apron, a short cotton frock considerably the worse for wear, gray worsted stockings, thick shoes, and a quilted sun-bonnet, from under the flap of which her nut-brown hair made its escape in tangled elf-like locks. Her bright hazel eyes had in them more of the expression of some half-tamed animal than that of an ordinary human being. Her features, though by no means uncomely, were somewhat heavily moulded and did not respond readily to emotional expression. For the rest, she was a well-grown strongly-built girl, and when she laughed her teeth flashed upon you like a surprise.

Margery's laugh, if laugh it could be called, was perhaps the most singular thing about her.

It was witch-like, weird, uncanny; it never extended to her eyes; it broke out at the most inopportune moments; to have been awake by it in the dead of night, and not to have known whence it emanated, might have shaken the nerves of the strongest man.

Margery was an orphan, and until she was sixteen years old, had been brought up on a canal barge. It was her boast that she could drive a horse or steer a barge as well as any man between London and the Midlands. But there came a day when the girl could no longer either drive or handle the rudder. Ague had got her in its merciless grip. The barge-man for whom she worked landed her at King's Harold with instructions to a relative of his to pass her on to the workhouse. But before this could be done Mrs Brooke had found out the sick girl. She was placed in a decent lodging, and the mistress of Beechley Towers paid all expenses till she was thoroughly restored to health. But not only did she do that: she went to see Margery three or four times a week, and sat with her, and talked with her, and read to her, and tried in various ways to let a few rays of light into the girl's darkened mind. Sometimes it happened that Mr Brooke would call for his wife when she was on these expeditions, on which occasions he would always stay for a few minutes to have a chat with Margery, so that in a little while there was no such gentleman in existence as 'Muster Geril.' But towards Mrs Brooke her feeling was one of boundless gratitude and devotion; it was like the devotion of a dumb animal rather than that of a rational being. Willingly, gladly would she have laid down her life for her benefactress, had such a sacrifice been required at her hands.

When the girl was thoroughly convalescent it became a question what should be done with her. Clara had extracted a promise from her never to go back to her old life on the canal. About this time it was that the Baron von Rosenberg set up his establishment at Beaulieu. An assistant was required in the laundry; Margery thought she should like the situation, so it was obtained for her.

'Why, Margery, what can be the matter? Why do you want to see me so particularly?' asked Mrs Brooke.

'It's about him—about Muster Geril,' she managed to gasp out. 'O mum! the polis is coming, and I've run'd all the way from Bulloo to tell you.'

'The what is coming, Margery?'

'The polis, mum,' answered the girl with one of her uncanny laughs. Miss Primby, who had never heard anything like it before, gave a little jump and stared at Margery as if she were some strange animal escaped from a menagerie.

'The police, I suppose you mean?' Margery nodded, and began to bite a corner of her apron.

'You must be mistaken, child. What can the police be coming here for?'

'To take Muster Geril.'

'To arrest my husband?' Margery nodded again. 'What can they want to arrest him for?'

'For murder.'

'For murder!' ejaculated both the ladies.

There was a moment's breathless pause. Gerald, with one hand on the back of a chair,

and one knee resting on the seat, had the impassive air of a man whom nothing more can surprise. He had gone through so much of late that for a time it seemed as if no fresh emotion had power to touch him.

'Great heaven! Margery, what are you talking about?' said Mrs Brooke with blanched lips.

'They say as how Muster Geril shot the gentleman—the Baron—what was found dead about a hour ago. Not as I believes a word of it,' she added with a touch of contempt in her voice. 'A pistol set with gold and with funny figures scratched on it, was found not far from the corpus, and they say it belongs to Muster Geril.'

'My Indian pistol which I lent to Von Rosenberg ten weeks ago,' said Gerald quietly.

'And now the polis have gone for a warryn to take him up,' added the girl.

'A warrant to arrest my husband?'

Again Margery nodded. She was a girl who, as a rule, was sparing of her words.

'I the murderer of Von Rosenberg!' said Gerald, with a bitter laugh. 'Such an accusation would be ridiculous if it were not horrible.'

Mrs Brooke wrung her hands and drew in her breath with a half moan. The blow was so overwhelming, that for a few moments words seemed frozen on her lips.

Gerald turned to the window. 'Can the irony of fate go further than this,' he said to himself, 'that I should be accused of a crime for refusing to commit which my own life was to have paid the penalty!'

In came Bunce once more carrying a card on a salver which he presented to his master.

Gerald took it and read, 'Mr Tom Starkie.'

'Says he wants to see you very perticler, sir.'

'Into which room have you shown Mr Starkie?'

'Into the blue room, sir.'

'Say that I will be with him in one moment. Come, Clara, come, aunt,' he said with a smile, as soon as Bunce had left the room; 'let us go and hear what it is so "perticler" that Mr Tom has to say to me.'

None of them noticed that Margery had stolen out on to the terrace, and was there waiting and watching with her gaze fixed on a distant point of the high-road where it suddenly curved, before dipping into the valley on its way to the little market town of King's Harold. Twilight still lingered in the west, and Margery's eyes were almost as keen as those of a hawk.

THE TRAINING OF TIDAL RIVERS.

To a seafaring nation like our own, the endeavour to render tidal rivers more safely and easily navigable must always be a matter of interest and importance. In the estuaries of some of the principal rivers of our own and other countries much has already been done. Channels have been deepened by dredging, winding courses have been improved by making straight cuts, obstructing rocks have been removed by blasting, and breakwaters have been constructed, where necessary, for protection against the waves. In some cases great success has been attained, and rivers formerly too shallow for anything but the smallest coasting vessels have been rendered navigable by

large ocean-going steamers. Much still remains to be done, especially for such rivers as have hitherto proved difficult to modify on account of strong currents, caused by the tide or the river itself, or both combined, which baffle the efforts of engineers to make and maintain convenient channels for navigation. In some cases, after great expense has been incurred in the construction of training-walls to guide a river in a particular course through a shallow estuary, very unexpected results have ensued. Sandbanks have formed themselves at inconvenient places, or the estuary on each side of the trained channel has silted up, diminishing the space available for water when the tide is in, and consequently diminishing the amount of water rushing out when the tide is ebbing, which formerly kept the channel open. To experiment on real rivers on a large scale would be very expensive, and might sometimes injuriously modify the estuary in ways not easily foreseen, and difficult, or even impossible, to correct.

Professor Osborne Reynolds was the first, so far as we are aware, to make experiments on a model constructed to scale, in order to show what results might be expected to ensue in a tidal estuary from certain proposed engineering works. He carried out such experiments in 1885, on a model of the estuary of the Mersey, in connection with the Manchester Ship Canal scheme. These investigations have been recently followed up by Mr L. F. Vernon-Harcourt, who has conducted a series of most interesting experiments on a model of the estuary of the river Seine, with the view of testing the comparative merits of several different schemes proposed for the improvement of the navigation of the river; an account of which he communicated to the Royal Society early in the present year (*Proceedings of the Royal Society*, vol. xlv., page 505.—Paper read February 7, 1889). He got a model constructed in Portland cement of the estuary of the Seine on a scale of $\frac{1}{100}$ horizontal and $\frac{1}{15}$ vertical. The reason for making the vertical scale one hundred times the horizontal is, that the fall of the bed in the tidal part of the Seine is very slight, so that even on these scales the rise of spring-tides at the mouth of the estuary in the model is only seven-tenths of an inch, while the model is nine feet long.

Whether the behaviour of the sand at the bottom will be similar in a model thus altered in proportions, to the behaviour it would show in a model in true proportions or in the real estuary, remains to be proved; but, from what Mr Vernon-Harcourt has observed, it seems likely that the facts which can be ascertained from a model such as his may be of real service to engineers in helping them to judge whether a certain proposed arrangement of training-walls would have the effect intended on the river-bed.

The rise and fall of the tide is produced in Mr Vernon-Harcourt's model by means of a zinc tray hinged on at the estuary mouth, so that the water situated in the tray represents the sea in continuity with the water in the estuary, and that the tray can be raised and lowered alternately to introduce an imitation of the tidal action. The period given to each tide in working the model is about twenty-five seconds. The water representing the fresh water of the Seine is admitted at

the upper end of the model from a tap, and an equal quantity of water is allowed to flow out by a cock with a large orifice at the lower end of the estuary, so placed as to allow the water to escape while the tide is high.

At the mouth of the Seine the navigable channel has not remained constantly in one situation, but has kept shifting to different parts of the shallow estuary. Two banks always appear, however, in some form or other on the old charts, between Havre, on the north side of the estuary, and Villerville Point near Honfleur, on the south. These have been sometimes connected with sandbanks inside the estuary, and sometimes detached. Rock and gravel are represented as cropping up on some parts of these banks in a recent chart drawn from a survey made in 1880. In the model, solid mounds of cement are introduced to represent these banks; also where the rocky bottom is exposed near Havre and Villerville, the model is moulded to the exact depths shown on the chart of 1880. At other parts the cement is kept well below the greatest depth attained by the channel at each place, and the bottom is formed of sand. At first, silver sand was used on account of its being easily obtained, and its purity and freedom from cohesion.

The working of the model was commenced in November 1886. From the outset, some interesting phenomena were noticed. The bore—a sudden rise of the water—at a place called Claudebec, and the reverse current just before high-water near Havre called the 'Verhaule,' were notably represented. After the model had been worked for some time, the channels near Quillebeuf—a place about twenty miles above Havre—took lines like those which formerly existed in the real estuary. Also a small channel appeared on the northern shore of the estuary by Harfleur and Hoc Point—a few miles above Havre—which is clearly marked in the chart of 1834. The main channel also shifted about in the estuary, and showed a tendency to break up into two or three channels at a place where the influences of the flood and ebb tides seemed nearly alike and in some sense balancing. The model thus reproduced very nearly the conditions of the real estuary forty or fifty years ago, before the training-walls which exist at present were begun; but the depth of the channels was not as great—as represented by the proportionately large vertical scale—as in the real river, on account, as Mr Vernon-Harcourt supposes, of the small scouring influence possessed by the minute currents in the model. 'The sand,' he says, 'in fact cannot be reduced to a fineness corresponding to the scale of the model, whilst the friction on the bed is not diminished equivalently to the reduction in volume of the current.'

The silver sand used at first was found to be too heavy, and not sufficiently mobile for the model. In carrying on the experiments various substances were tried, to imitate the suspended sediment carried down by the river, the desideratum being something 'insoluble in water, easily scoured, and therefore not pasty or sticky, and sufficiently fine or light to be carried in suspension to some extent by the currents in the model, and not merely rolled along the bottom like the silver sand.' After trying pumice in powder, flower of sulphur, pounded coke, fuller's earth,

lupine seed, coffee-grounds, &c., all of which proved unsatisfactory for various reasons, Mr Vernon-Harcourt found a kind of fine sand with a small admixture of peat on Chobham Common, which suited his purpose. With this sand he formed the bed of the estuary.

In 1848, training-works were commenced in the Seine estuary. The original intention was to continue the trained channel down as far as Honfleur, on the southern side; and to prolong one or both of the training-walls towards Havre, which is situated farther down the river on the opposite side, the interests of both these ports having to be considered. In 1870, the training-walls had reached Berville, about thirteen miles above Havre. At this stage the works were suddenly stopped in the interests of the port of Havre, on account of the large unexpected deposits which were taking place behind the training-walls, and at the sides of the wide estuary below them. Many different schemes have been proposed, especially within the last few years, for extending these works with the object of training and deepening the shifting channel below Berville, and improving the access to Honfleur without endangering the approaches to Havre.

After having reproduced in his model the state of the estuary before the training-walls were constructed, Mr Vernon-Harcourt next proceeded to insert strips of tin, to represent the training-walls as they are at present. These strips were cut to the proper heights according to the scales, and bent to shape, and inserted piece by piece; the model being worked for some time after each piece was put in, in order to imitate as closely as possible the real conditions. The result was that the foreshores at the back of the training-walls were raised by accretions of sand, and the channel between the walls was scoured out in the model as in the actual estuary. Also the accretions extended down beyond the ends of the walls as far as Honfleur on the left bank, and Hoc Point on the right, and a certain channel near Harfleur was filled up—all these changes corresponding with the actual changes in the Seine.

The success of these experiments with the existing walls gives encouragement to suppose that the further experiments afterwards carried out to try the effects of several of the proposed schemes do really indicate more or less exactly what would ensue in each case if the works were constructed.

The schemes experimented on may be divided into three classes: (1) Outlet of estuary considerably restricted. Channel trained inside towards outlet. (2) Channel trained in sinuous line, expanding towards outlet, but kept narrow at changes of curvature. And (3) channel trained in as direct a course as practicable and expanding regularly to outlet. The last form of channel proves to be decidedly the most promising. In the first class of schemes there is a tendency to the formation of a bar in front of the narrowed outlet, also the channel tends to be irregular in depth, and deposits accumulate inside the estuary; while in the second class, the advantages expected by the designers through making use of the scour at the concave face of bends were not realised.

These experiments may prove very useful, not only as affording guidance in the choice of a scheme for the training-works in the Seine estuary, but also as indicating some general principles

for the guidance of harbour engineers in other places. Direct experiments on models for each estuary where harbour-works are contemplated would be very desirable, where possible, in order to reproduce the special conditions of the estuary to be investigated.

MR GATHERWICK'S PRODIGAL.

THERE was a pause in the Gatherwick office. The half-hour after five had rung out some minutes before; six was closing-time; and it was one of the articles of Mr M'Callum's creed that it was injurious to the constitution to pass straight from the whirl of business to the chill outside air. Mr M'Callum was chief-clerk; there were but two; and whenever it was practicable—that is to say whenever Mr Gatherwick himself was not present in person—he made a point of allowing a suitable margin for general conversation, before the two descended the stairs and set their faces homewards.

It was Mr M'Callum, of course, who was leading the conversation to-night, and the subject of all others that had come to the front was the case of the Prodigal Son, suggested possibly by a circumstance that had occurred that same morning. Among the letters by the second post had been one in a big dashing hand, which without reading further than the head of the first page, Mr Gatherwick had promptly put into a fresh envelope and re-directed, presumably to the place it had come from; but he had posted it himself, instead of leaving it with the others to the junior clerk, Davidson. Davidson took a special interest in that dashing handwriting, and was labouring under a sense of injury accordingly.

'For myself, I never quite agreed with all the fuss that was made over that young renegade,' Mr M'Callum was remarking with an emphatic flourish of his ruler. 'It's not the practice, in these days at any rate; and I'd not advise any one to follow his example on the chance of getting the like reception.'

'Then you would have left him to starve, I suppose?' returned Davidson, who represented the entire audience.

'Not entirely—moderation in all things. He might have been taken in on probation for a time, till they saw how far his reform was to be depended upon.—No; on the whole, I'm not saying but I agree with Mr Gatherwick.'

'Mr Gatherwick is obliged to you, sir,' said a deep voice from behind; 'but instead of discussing matters that do not concern you, kindly put up your books and go.'

Mr M'Callum collapsed. He did as he was bidden in perfect silence, too overcome even to attempt an apology. Davidson followed him as swiftly as possible, and Mr Gatherwick was left in solitary possession of the field. A limited and very dusty field; but the stiffest battle of his prosperous life had been fought out there. It was the old story: his only son, easy, careless, thoughtless—in all respects the antipodes of his father—mistakes in the cash-book—inquiries hushed up—disgrace, and banishment. That had happened two years ago, and this morning's was the third letter that had been sent back unread.

Mr Gatherwick was at one end of the pole, Mr

M'Callum at the other, yet both held precisely the same view on one subject. The prodigal in that old parable had been forgiven much too easily; the father had exhibited an amiable weakness that was altogether reprehensible under the circumstances. Mr Gatherwick involuntarily commended himself for his sounder principles, and felt that he had done righteously in returning that unread letter.

And yet, somewhere underneath was a faint uneasy sense of discomfort—of something wanting. For what end was he working now? He had no irreproachable elder son to fall back upon. Hospitals and almshouses are useful institutions, but few men labour with enthusiasm for their sole behoof. He might endow another school, perhaps; but there appeared to be schools in abundance already, and he himself was a self-taught man. Mr Gatherwick abruptly wound up his reflections at this unsatisfactory stage, locked up his safes and rooms, and hurried away down the stairs and through the busy gas-lighted streets to his handsome solitary house, wherein dwelt no one person to watch and wait for his advent.

The letter went back whence it came—not very far; it was from an English seaport town this time; the last had been from New York. It went back, and was greeted with sore dismay.

'That is the last time I will ever trouble him, Nell,' said Maurice Gatherwick, the younger, flinging it into the fire. 'He does not know what forgiveness means, and he need not begin to learn now, as far as I am concerned.'

Nell looked up from her stitching with a disappointed face. 'O Maurice, I was so sure he would tell you to come home when he found you were so near. What are we to do?'

'Don't fret, Nell. I'll have a hunt round the shipping houses here; and if the worst comes to the worst, well, we can go back to Glasgow on our own account.'

'Do you think it's because—because you married me?' she asked anxiously a minute or two after.

'No, Nell; that it certainly is not. He has not even read the letter, nothing but the address to which he could send it back again.'

When Maurice set out to the far country—New York in his case—Nell and her mother had been fellow-passengers. The mother had been ailing all the journey, and died the day before they reached Sandy Hook. Nell was left solitary, almost penniless. Maurice's sole fortune was two hundred pounds, descended to him from his mother. What could have been a more suitable arrangement than that they should marry and combine their joint misfortunes?

Somehow the States had not proved the Eldorado they had expected. There Maurice gained his first personal experience of poverty. He had no associations of that kind with his own country, and naturally came to the conclusion that once back, it would be an easier matter to find some employment that would eke out their scanty means, beside the hope that Mr Gatherwick might relent and be willing to overlook the past miserable folly. But that hope had to be struck out of their calculations now, and they were not through the first week yet.

The shipping houses followed suit. 'There is only one course left, Nell; we must go back to Glasgow,' Maurice announced at the end of the

second week. 'There will be a better chance there for me; I know the places.'

And so the little tent was pitched once more, and Maurice found himself back among the old haunts—with a difference. Then he had been a rich man's son and heir, now he was one of the rank and file, and the rank and file were inconveniently plentiful, it seemed to him, during that long quest after a clerkship.

'Hurrah! I've got it at last,' he cried, one rainy night, leaping up the stairs into the shabby sitting-room. 'Forty pounds a year, and a steady rise of a pound. Why, in seventy years I'll have—I'll have one hundred and ten!—Never mind, Nell; it's better than doing nothing.'

'A great deal better,' assented Nell cheerfully. 'It will seem quite a fortune after all the failures; only I do think you ought to be worth more than that, Maurice.'

'I used to think so too; but all depends from what point you look at it.' Davidson at our office had forty, and it never occurred to me that it was too little. I should like to see that lad again,' he went on, starting off on a new track, as was his fashion. 'He would have done anything for me in those days. I'll look him up when we get settled down here.'

They were both thankful for this clerkship, very thankful; but when one has been in a certain groove for a lifetime, it is not easy changing into another, and those two idle desultory years had not been altogether the best training for a daily steady grind. Maurice liked pleasure and sunshine and ease generally; prodigals are not usually a race of immaculate heroes; time and space granted, his prospects of attaining the giddy height of that hundred and ten stipend were but faint. The novelty wore off in the first three days, and then it was only sheer necessity for himself and Nell that kept him to his post.

'I understand those husk banquets now very well,' he remarked one day to Nell; 'but if that prodigal had had my stool and forty pounds a year, he would have hurried off home even quicker than he did.'

'Don't you think you might try once more?' suggested Nell half under her breath. 'He has no one but you.'

'No,' said Maurice decidedly; 'that's settled. I sent a message to Davidson to come and look us up to-night. Can we afford to give him a cup of tea, Nell?'

'Oh yes,' laughed Nell; 'two, if you don't mind it being a little weak. They say it's bad for the nerves too strong.'

'I couldn't say, it's so long since we had a chance of judging. Never mind; Davidson is not particular.'

Maurice had an extra turn at the grindstone that day, and did not reach home for some time after the visitor's arrival. Nell was sitting by the fire, trying to keep up the conversation, with rather indifferent success. She broke off with a sigh of relief at the sound of her husband's foot on the stairs. Davidson flushed a sudden uncomfortable scarlet; he got up off his seat, and then stood grasping the back and hesitating. However, there was no hesitation about Maurice; he greeted his father's clerk as if they had parted yesterday, and under the most ordinary circumstances, and were meeting now in the paternal

mansion, instead of this fourth-flat threadbare lodging.

'And you are still in the old place, my boy? and M'Callum too? just as usual.'

'Yes, sir.—I'm glad to see you back, Mr Maurice; the place has not been right since you went.—Are you—are you —?'

'No, Davidson; I'm *not*.—Don't run away with any ideas of that kind. That ended some time ago. I have just got to peg on here and help myself.'

'But do you like it, Mr Maurice?'

'Candidly speaking, I can't say I do; but needs must, you know.'

Davidson looked unsatisfied. 'It doesn't seem right,' he was beginning dolefully.

Maurice interrupted his lamentation. 'It's no use crying over spilt milk, my boy. Take you a solemn warning by my case, and don't slide into crooked ways. You don't slide back again as smoothly, by any means.—Now, draw up your chair, and we will have some tea.'

That was the first of Davidson's visits. They continued regularly all the rest of the winter; through the hot stifling summer, when only dust and heat spoke of the green glory that hovered over the whole land beyond this wilderness of stone and lime. Maurice longed as he had never longed in his life for one sight of tossing waves and breezy moors; only there was the landlady and the butcher and the baker, and a whole army of smaller satellites planted between, barring the way.

'Davidson, stay behind to-night; I wish to speak to you,' said Mr Gatherwick in a peremptory voice, one day when that dusty summer was merging into autumn. He was opening his private door as he spoke, and he passed in and shut it to with an ominous click.

Mr M'Callum twirled round on his stool to inspect the delinquent. 'What pranks have you been up to now, Davidson?'

'None that I know of,' was the answer; 'unless'—There he stopped, with a sudden fear that he *did* know, and that there would be a bad half-hour before him. How it could have come to his master's ears puzzled him; he had never mentioned Mr Maurice's name even to M'Callum.

'Well,' pursued Mr M'Callum curiously, 'there is something, and you know that quite well. Better make a clean breast of it at once. Don't wait till it's a case of disappearing, like—well—like some one who shall be nameless. The downward track is easy, but there's no turning back, mind.'

'There ought to be a turning back,' said Davidson gloomily; 'it's hard lines if one slip is to be reckoned up against one always.'

Mr M'Callum whistled. 'So you have been slipping. I thought as much, and you cannot say I have not warned you often enough against trying that prodigal business.'

With a solemn shake of the head, Mr M'Callum turned round to his desk again. There were sounds of some one moving about the inner office, and Mr Gatherwick might reappear at any moment; and in much uneasiness of spirit Davidson also went on with his invoicing.

'Now, then,' began Mr Gatherwick sternly, when six had arrived and, very unwillingly,

M'Callum had retired down-stairs—'How long have you been in communication with my son, may I ask?'

'Since last January,' came the unwilling answer.

'Indeed, knowing it to be against my orders.'

'I didn't know it, sir,' said Davidson, blushing at his own audacity. 'You never said we were not to speak to him, and Mr Maurice was very kind to me when he was here.'

'It is not to happen again,' said Maurice's father decidedly. 'I will have no go-betweens in this office. Mr Maurice ought to have known better than to employ you in such a capacity.'

'He had no thought of any such thing,' began the culprit earnestly; 'and he's working so hard, he that'—

'That is enough,' interrupted his master. 'Pay attention to what I have said.—That is all; you may go now.'

Davidson's strongest point was not valour; he went down disconsolately. At the end of the street he encountered M'Callum; not that that gentleman was waiting there for the purpose, only seeing—as he mentally phrased it—that there was a screw loose somewhere, it was but considerate to try to put it right, the first step of course being to find out which screw it was.

But that was the difficulty. Davidson flatly declined to give him any information about the matter, and thereby laid the foundation of a coolness that for weeks after completely took the gilt off those constitutional half-hours before closing-time.

Winter set in early that year, early and very bleakly. Week after week the bitter east winds went driving down the streets which Maurice Gatherwick trudged daily back and forwards, scantily clothed, and often scantily fed; little wonder that he felt it keenly.

'I think we must be growing old, Nell,' he remarked one night as he came in with blue fingers and chattering teeth. 'I used to enjoy frost and snow thoroughly, instead of shivering along after this fashion. They say you do feel the cold more when you are getting on in life.'

'It is a new overcoat you are needing, Maurice,' she said, stirring the tiny fire to a blaze. 'Couldn't we manage one? It is such a long way to that office, and you must keep well.'

'Nell, do you know how much cash I possess at this present moment? Just three-and-ninapence. If you will persuade any tailor to furnish one for that, you are heartily welcome to try. Afterwards, you might look up a shoemaker on the same terms; I am needing boots worse still; look at those.'

Nell shook her head.

'Well, well,' said Maurice, with an attempt at looking resigned, 'another month, and the worst of the winter will be over, if we can only hold out.'

If— Before that month was over, the prodigal's brief career was ended. Utterly unfitted for the battle, either by nature or training, it ended as any one might have safely foretold from the first. One morning he was not equal to going down to the office; he would rest and go fresh to-morrow; but to-morrow he did not want to leave his bed, and a cheap doctor had to be hastily sent for.

The doctor spoke of a touch of pleurisy, and a constitution below par, and promised to send in a bottle of medicine and come again to-morrow.

Nell put on her bonnet after dark and raced round to Davidson's lodging.

'He looks so ill,' she sobbed out. 'Oh, do go and tell his father; he wants better food and so many things we cannot get.'

'It'll not make any difference, Mrs Maurice. You don't know what Mr Gatherwick is when he makes up his mind.'

'But for his own son. Do go and tell him,' pleaded Nell.

'It's as much as my place is worth,' said Davidson, aghast beyond measure. 'But it's Mr Maurice. I'll try it.'

Nell went back to her husband. Davidson buttoned up his coat without giving himself time to think, and hurried off to the dull stately house where Maurice had been born and brought up.

'See Mr Gatherwick!' 'Why, he's just at dinner,' said the scandalised man to whom he made his request.

'Dinner or not, you must tell him it's important.'

The man debated for a moment; he was new to the situation, and perhaps scarcely realised the risk. He opened a door close by, and Davidson could hear the message delivered.

'There's the young man from the office, sir, Davidson by name, wishing to see you, and won't take no denial.'

'Davidson? Show him in.'

With his first glance down the brilliantly lighted table, there flashed across the visitor some odd fancy about the fatted calf; it was there in abundance; but this father was eating it alone.

'Well, what has brought you out here?' demanded Mr Gatherwick without laying down his fork.—'You may leave the room,' with a glance at the man in waiting.

'It's Mr Maurice, sir; he's very ill, and his wife's frightened about him. She's too poor to get him what he ought to have.'

At that same table—Davidson could have touched the spot with his hand—had once stood Maurice's chair. Perhaps Mr Gatherwick thought of it also for one fleeting instant before he remembered his principles.

'The old story,' he said impatiently. 'We have heard it all before. I thought I told you some time ago that I would have no communication between you.'

'And I have never been there since,' said Davidson; 'but—for the first time daring to assert himself in opposition to the great Mr Gatherwick—I've not forgotten him, and I'm going straight to him now.'

The fatted calf might have played unmolested in its native fields, for all Mr Gatherwick consumed after his clerk's departure. He had believed in and stood by certain rules and principles all his life; his son had gone counter to both. If he were to bring him back to-morrow and put him in the old place, how long would it last? Could he risk that sore disgrace a second time? Possibly at no distant date. This exile meant more to him than it could to Maurice. He had lost the most by it: a solitary old age stretched before him; better that, than to build up fresh plans with a broken faith for foundation. Maurice was young,

and would find out new interests—nay, had found them already. Nothing ever troubled him long, thought the father bitterly; and he sat still and made no sign, while the slow hours ticked themselves past.

Davidson went away to M'Callum in the sudden revolt, and told him the tale of Maurice's wrongs. M'Callum listened in much perplexity. His theories about prodigals were well known; had he not reiterated them over and over again in Davidson's unwilling ears? And yet he, too, had liked Mr Maurice; prodigals often are rather likeable people—he would go and see him at any rate, and there would be no harm done if they took some jelly or wine with them.

'I believe it was black currant jelly they used to give me when I was ill,' he remarked on the way. 'We had better buy a pot; it's said to be strengthening stuff, if you give it a fair trial.'

This patient was past giving it a fair trial; he smiled faintly up in M'Callum's perplexed face—talked a little disconnectedly about Nell, and his father, and school-pranks long ago—and finally drifted away to a much farther country just before daybreak.

Nell laid her face down on the pillow beside him with a burst of passionate tears. 'We were poor, and hungry, and cold often; but he never said an unkind word to either mother or me since the first day we saw him; and I'll love him—I'll love the very sound of his name all the days of my life.'

And some of us—not prodigals by several degrees—need not complain if we get no better epitaph.

There is something to be said on both sides. Was ever yet a flawless unassailable case recorded? Cheap victories are worth little. Mr Gatherwick vindicated his principles thoroughly, carried them out to the end; but there are times when he sits alone at nights listening to that clock ticking out the hours, and feels that he would give all his wealth for one sight of the young face that lapsed out of the march long before its time, for lack of a helping word he might have spoken—a hand that he might have stretched out.

GIBRALTAR A HUNDRED YEARS AGO.

THE celebration of the tercentenary of the Armada raised a transitory interest in Spanish history, and, consequently, in anything connected with our occupation of the mighty Rock-fortress of Gibraltar, to obtain which so many hard-fought battles and sieges have been withstood, and to retain which requires a strong garrison of troops ever ready for any possible though not probable emergency. A perusal of the archives of the garrison since it came into our possession in 1704 gives a little insight into the curious customs and mode of carrying on the government of the place; and the following extracts, collected from the General Orders published between 1700 and 1800, will no doubt prove interesting.

Desertion seems to have been a source of much trouble to successive governors of Gibraltar. In September 1757 the following General Order was issued: 'Four men will be shot for desertion on Windmill Hill in presence of the whole garrison.—By order of the court-martial.' These poor fellows fared badly; and no doubt a similar fate would

have befallen the four men referred to in the next extract, but for the kind recommendation of the Spanish general: 'In accordance with the convention, the Spaniards have returned to the garrison four deserters. The Spanish general having been pleased to beg the governor not to inflict the full penalty, it is hereby ordered that three of them have a yellow paper put in their hats, written "Traitor to the King, Country, and Religion," and the other, who has added robbery to his crime, has a green paper, with "Traitor to his King, Country, and Religion, and a Thief," and be marched through the town.'

In some cases it would appear that 'one more chance' was given, according to the humanity or temper for the time being of the governor; for instance: 'James Jewett, of Brigadier Clayton's regiment, has been shot; he, with five other men, having been condemned for desertion. At the place of execution, two were reprieved, and the remainder drew lots for their lives, Jewett being the loser.' And not only were the soldiers themselves sufferers, but the officer came in for a share of the penalty when the deserter escaped altogether: 'Be it known for the future that if any officer's servant desert when absent from the regiment, the said officer shall replace him with a good recruit, or pay twenty-five dollars for the non-effective.'

Summary vengeance was also placed in the power of the sentries, as would appear from the following: 'Yesterday, during bathing, one of the soldiers had the audacity to swim off and desert. Sentries are now commanded to fire on any man who swims beyond fifty yards and refuses to return when ordered.'

Punishments were heavy and swift; and no doubt the discipline of the garrison required a strong hand. For example: 'Private Thomas — to receive ten hundred lashes with a cat-o'-nine-tails, so much of the punishment as he can bear to receive at one time on the Grand Parade, and the rest afterwards; the last fifty lashes will be administered by the common hangman between the Southport and Waterport gates, where he will be drummed out of the garrison with a halter round his neck.'

Occasionally, when special works were being executed and labour was costly, it was found an advantage to give prisoners a chance of avoiding some part of their sentence. In 1749, General Bland issued the subjoined Order: 'Men sentenced by court-martial to corporal punishment may commute the same by working on the new road to the signal station, as follows: fifty to one hundred lashes, one day's work; one hundred to two hundred lashes, two days' work; and so on.—By Order, GENERAL BLAND.'

Politics could not be so freely indulged in as at the present day, for 'Mr — is hereby ordered out of the garrison for drinking the health of the Pretender. If he has not left in two hours from this, he will be forcibly turned out.'

The post of executioner at the period must have been anything but a sinecure. He required special protection. 'Samuel Lewis having been duly appointed executioner for this garrison, the governor orders that no person shall offer any abuse to the said Lewis, either by throwing stones or striking or upbraiding him on account of his unpleasant duties—on pain of the severest punish-

ment.' And the above Order being ineffectual, we find shortly afterwards that 'Notwithstanding the Order lately issued, the governor finds that Lewis the executioner has been abused by soldiers and others throwing stones at him, breaking his head, and maltreating him grossly. Whoever shall be found, hereafter, acting in a similar manner in face of these Orders shall be whipped severely by the said executioner until he is satisfied.'

The jailer, even, was not allowed to possess a feeling heart, as the following Order implies: 'It is reported that the provost-sergeant of the Moorish castle does not inflict the whole of the punishment awarded to prisoners under his care. Now it is ordered that, in future, when this occurs he shall receive the remainder himself.'

The common executioner was not the only person who became obnoxious to the inhabitants. On the occasion of the visit to the garrison of the Alcalde of Tetuan it became necessary to appoint a man specially to protect him and his suite: 'During the visit of the Alcalde of Tetuan an orderly sergeant shall be attached to the Moor who is his secretary, to prevent the sailors or soldiers abusing him and his countrymen.'

Gambling and billiard-playing were rife then, as now: 'Billiards shall not be played after second gun-fire in the evening, on peril of having the table broken to pieces and burned on the public parade.'—Gaming, especially the game of "Devil-and-the-Tailors" and "skittles," will not be allowed in any winehouse.—'Between June 1st and September 13th no soldier will be allowed to play at five.'

Robbery had to be dealt with in the absence of police and detectives. Amongst the troops, petty pilfering of the food and clothing having been discovered, an Order was issued to meet the case: 'It having been divulged that soldiers have a method of surreptitiously disposing of their necessities, which they call "fighting a cock," the governor now positively orders that this practice be discontinued, otherwise the men belonging to the barrack-room where this custom takes place will pay the value of the said necessities.' And as this was not successful, possibly from favouritism, the governor determined to make some one responsible: 'It being evident that no robberies can be committed but what may be discovered by the sergeants and corporals, it is ordered that they pay for all if the offender is not brought to light.' When a robber was caught he was made an example of: 'John —, who committed the robbery at the storehouse, will be executed at guard-mounting to-morrow morning at the said storehouse. The body, with a label on the breast, on which is written the word "Plunderer," to remain hanging till sunset.'

Not only were the rations of the soldiers stolen, but the charges actually abstracted from the guns, for what purpose other than mischief is mysterious: 'Some evil person having been so unsoldier-like and scandalous as to have drawn the charges and stolen the gunpowder from eighteen guns, a reward of one hundred dollars is offered for the detection of the infamous thief.—The punishment is death.'

At last, a General Order was promulgated, calling upon the civil inhabitants to turn themselves into special constables for the putting down of crime: 'Every night, certain inhabitants armed

with a permit from the town-major must patrol the streets to prevent robberies. The military patrols are not to interfere with them, but must render assistance if required. And during the day, officers and non-commissioned officers commanding guards are to send out patrols frequently with their arms unloaded to kill every dog they see going about the streets. They are not to fire at any dog, but to kill by stabbing or some other way.'

The extermination of dogs here referred to must have been a wholesome practice worthy of imitation at the present time, when the streets of the garrison are overrun by mongrels of all shapes and sizes. Many of these are, however, only day-visitors from Spain, trained to smuggle tobacco, which is fixed upon their backs and sides like pack-saddles; in which state they are sent off to their homes in the Spanish lines, running the chance of a stray shot from some carabino.

Horses and donkeys appear to have been a source of annoyance to the governor at some period, for he gives notice that, 'Any donkeys loose in the town are to become the property of the person taking them away; and any straying on the ramparts are to be shot by the sentries.'—'If any horses are found on the hill to-morrow, the governor will order out a firing-party and shoot them.'—And, again, he aims a blow at horse-racing: 'In consequence of the rioting and disorders which happened yesterday, the governor expressly forbids any more horse-racing.' But this has since been rescinded, as racing is now one of the chief amusements of the garrison.

The sentries at the English lines required continual watching and strict discipline to keep them up to their duties. The Orders dealing with them are very numerous, and a few of the most quaint are selected. Here is a funny one: 'The court-martial assembled to decide whether a sentry quitting his post before relieved, or found sleeping on duty, should be punished by "running the gantlet," or whipped at his post, according to the custom of the garrison ever since it came into the hands of the English; resolved, that in consequence of the scarcity of twigs, "running the gantlet" cannot be continued, and the duty of the garrison being very heavy, no time can be spared to collect them.'

The following may have acted as a suggestion to Lord Wolseley: 'It is intended shortly to issue a little treatise or pocket-book for the instruction of officers and soldiers of this garrison, wherein they may learn what is in future to be considered a breach of duty deserving punishment. From it they will discover that a sentry-box and a shower of rain can justify a sentry in acting in a manner that has hitherto been looked upon as a most notorious breach of discipline.'

When the gates were locked at evening gun-fire, a special salute was required for the keys: 'All guards to rest and beat a march to the keys, town-guard excepted.' And a good attempt at keeping sentries awake was devised by this Order: 'All sentries who do not cry out "All's well" every two minutes shall be punished with two hundred lashes.'

The art of saluting gracefully was duly impressed upon the troops, even at this early date: 'When a soldier passes an officer, he shall look

him respectfully in the face and carry his hand gracefully to his head in salute.'

From the next excerpt it would appear that some special distaste for the duty was felt by the sergeant-major referred to, or surely a verbal command to attend the court-martial would have met the case: 'Captain — being appointed president of the court-martial to be holden to-morrow, the sergeant-major of his regiment will attend the said court and write down the proceedings.'

At the commencement of the present century, an epidemic of smallpox visited the Rock. This caused the issue of an Order stating that 'Cowpox being not so contagious as smallpox, a general inoculation for the former disease is hereby ordered.' And afterwards, the sight of victims being obnoxious to the inhabitants, an Order was put out defining that 'People marked with the smallpox are not permitted to stand at their doors or go into the streets. No mackerel to be suffered to come into town.—By order.' Where the 'mackerel joke'—if it is a joke—comes in, is not sufficiently explicit. And when scurvy attacked the troops, thirty thousand lemons and two thousand pounds of onions were issued in accordance with the Order quoted below: 'Lemons and onions will be issued to the troops without stint, on account of the prevailing scurvy.'

The following summary Order speaks for itself: 'Ships coming into the bay without showing their colours are to be fired upon, and the cost of the shot recovered when the port-dues are collected.'

The creditors of the civil and military inhabitants had evidently been 'walking round' the governor previous to the publication of the following: 'When the bounty-money is paid, all good soldiers are expected to pay their debts, and it is recommended to all volunteers also to apply at least half of the amount in a similar liquidation.'

Fishermen supplying fish to the garrison seem to have been somewhat arbitrarily dealt with. An Order was early promulgated that no fish whatever was to be offered for sale until the governor's table was supplied; but in 1759 this edict was modified by Lord Home, as follows: 'It having been represented to the governor that the practice of bringing fish to the convent for selection by His Excellency's servant, before being allowed to dispose of same to the general public, was a hurt to them, Lord Home hereby cancels that Order; but commands that they do not sell or dispose of any of their fish before the governor's servant has bought what may be required for his table; and the servant employed for that purpose will have orders to be early at the market every morning, and to acquaint the officer of the guard as soon as he has bought sufficient.'

It is apparent that considerable jealousy and bickering were engendered by the fish question. The governor having been supplied, various favoured individuals got the next pick, to the annoyance of the general public; and upon representing the matter to the authorities, the following General Order came out: 'Whereas several fishermen have offended by bringing their best fish into the town for particular persons, instead of displaying it in the public market

—it is ordered that all fish must be sold there in future, and none hawked or sold about the town on pain of the man being seized and the fish forfeited.'

What gave rise to the next extracted Order is not disclosed: 'The governor hopes that for the future no person living in the garrison will send out any letter, parchment, or anything else into Spain through the Landport gate, without first acquainting him and obtaining his sanction.' Nor why there should have been any necessity to give Orders like the following: 'Any man who has the misfortune to be killed is to be buried by the guard where it happens, and his clothes sent to his regiment.'

Here is a General Order defining where, how, and when people may walk on fine evenings: 'Inhabitants are permitted to perambulate the streets of the town or the road to the New Mole and South Barracks till nine p.m. without a light. After that hour, no one will be permitted to be out without a light; and no inhabitant can be out after ten without a permit as well as a light.'

The 'powdered-hair-and-queue' period was one of considerable anxiety to the government, as would appear from the following precise General Order: 'In consequence of some officers not having hair long enough, and finding it difficult to form a queue to their head, it is ordered that such officers may, for a period restricted to two months, during which time the hair will grow, be permitted to affix a queue otherwise. But on no account will the two months be extended.'

Again: 'On account of the scarcity of flour, no soldier will be allowed to powder his hair till further orders: and to economise cartridges, each man will have a charge of powder issued to him in a cane, and a loose ball, which he will carry in the cock of his hat.' The last mandate was, however, due to the scarcity of provisions and ammunition at a moment of peril. Butter, too, ran short: 'In consequence of the scarcity of butter, an additional supply of bread will be issued as an equivalent.'

Then, on the unexpected arrival of more troops, the following Order became necessary: 'In consequence of the want of barrack accommodation, it is ordered that the four regiments of Kerr, Pearce, Egerton, and Bisset sleep their men three in a bed, and as many beds in a room as possible. These arrangements to be made in the morning.'

Various governors have been much exercised how to prevent suicides, and their detestation of the crime may be assumed from a perusal of the following Orders: 'It is the General's Order that Edmund — of the —th regiment be placed upon the gibbet at the top of the hill, as a mark of ignominy for his abominable stupidity and wickedness in disobeying the laws of God by committing suicide.'—'A man of the —th regiment has been so wicked and cowardly as to hang himself. The commanding officer is ordered therefore to put all possible disgrace on such a heinous crime, and treat the corpse with the greatest ignominy. No funeral service shall be held over it; but the body shall be hung, heels upward, for two hours, and then hung over the line wall like a cat or dog.'—Yesterday was discovered the skeleton of a soldier at the

foot of the rock, broken to pieces and otherwise unrecognisable. The only marks to distinguish which regiment he belonged to were the letters "J. Y." on his stockings. Any regiment having lost such a man will apply to the town-major forthwith and claim his bones.'

These were the good old days, when the Commander-in-chief was permitted to carry an umbrella without giving offence to the nation: 'No soldier or officer (except the Commander-in-chief) shall carry an umbrella when on duty.' Still, there was an evident wish on the part of the government to retain as far as possible the military appearance of the troops: 'The General desires to express his astonishment at meeting an officer coming from Spain dressed in a large straw hat and an umbrella; and, as if to add to the burlesque, another officer riding behind him. The General forbids any such indecency in future, and will not grant permits to any officer dressed in such an unmilitary manner.'

Funerals must have been performed in rather a perfunctory way to necessitate this Order: 'Chaplains attending funerals will please see that the grave is fully six feet deep before allowing the corpse to be lowered, and more particularly in the case of sailors buried without coffins. And also to see that the grave is properly filled up.'

Here is an encouraging notice, such as we may never expect to see issued in these red-tape days: 'Several valuable suggestions having been made to the governor lately by officers of the garrison, which have been or may be adopted and prove advantageous to the king's service, he wishes to invite further useful observations and hints from officers of all ranks, assuring them that such beneficial discoveries will be publicly acknowledged at the proper time by the proper authorities.'

The following Orders refer to the salutes to be fired on the king's birthday: 'All the guns in the garrison to be fired on the king's birthday.' — 'This year [1788] fifty guns will be fired for the king, and twenty-one for the queen.'

We have saved the most important notice till the conclusion, because we believe the offer contained therein has not yet been accepted, and it may meet the eye of the delinquent or his descendants: 'Some gentleman visiting the governor has taken a hat belonging to Mr —, and left his own in its place. The governor gives notice that the owner of the remaining one may exchange hats at the convent, if he pleases.'

MY ORDERLY.

WHEN I was ordered up to the hills on duty, and left my regiment in the Punjab, I took formal leave of my sepoy orderly at the door of our forsaken bungalow, and presented him with all the old newspapers, broken chairs, tin boxes, bottles, and such other valuables as one generally leaves behind on seeking new pastures. But, to my astonishment, he rushed wildly on to the platform just as the train was starting, to give a final salute, gasping for breath, with great tears trickling down his black cheeks. He must have run after the *gari* all the way to the

station, or gone across country through compounds and over walls with wonderful agility for a lumbering six-foot Sikh. Anyhow, I was so touched by this unexpected display of emotion on the part of the simple sepoy, that stretching my arm out of the window, I warmly wrung his hand in a second farewell. Then I suppose he went sorrowfully back to see that nobody had appropriated his precious *Punches* and *Graphics*, and to haggle over the price of the bottles and biscuit-tins in the bazaar, while I rattled away to Lahore, sorry to part with my faithful but stupid *lbtman*. For he was thick-headed to a degree, and, with an intense desire to please, he combined the most astonishing faculty for working mischief and making mistakes in the simplest bit of work.

Once, shortly after he had come to us fresh from the lines, two ladies coming to call found this smiling giant in the veranda, and on hearing that the Mem sahib was within, they placed in his unsuspecting hand several cards. This was evidently a new experience for Mana Singh; but being apparently some form of *ddk*—that is, post—he went into the drawing-room, which happened to be empty, and laid the cards on the table on which he had been taught to put letters. He then retired by another door to the back of the house to think over the matter, leaving the ladies to wait outside for a considerable time, when they were luckily seen by my bearer. After this, nothing would induce Mana Singh to face a lady coming to call, he being evidently in dread of meeting the victims of his previous error.

His conversation was absolutely unintelligible, the little Hindustani he knew being obscured by a strong Gurmukhi accent; and his shyness when in society, especially in the presence of ladies, was overwhelming. When he came into the room with one of his very numerous idiotic questions, his feelings generally deprived him of the slender powers of speech he possessed, and he had a trick of picking the whitewash off the wall with his nail, while his two big toes engaged in a furious battle with each other as he stood speechless with shamefaced emotion, the picture of imbecility. When my wife's risibility was naturally excited by this display, he would join in the laugh with a hysterical giggle which continued until he was sent outside to recover.

It was very risky to send him shopping in the bazaar; there was no saying what he might not invest in. After one alarming feat in this line, my wife gave up having his assistance in her housekeeping. He was sent to buy some soap, but evidently misunderstood what was wanted. After having been absent the whole day, during which, as he himself explained, he had ransacked both the Sadr Bazaar and the native city, he appeared triumphantly in the evening with a large living snake tied up in a cloth, which reptile he proudly let loose on the floor to everybody's consternation. Luckily, the snake was harmless; yet it was a most undesirable article of domestic economy, the very antithesis of soap, and so the crestfallen orderly had to return it the next day.

He was not a *shikari*, although very desirous

to figure as such. When we were marching along the Afghan frontier, I sometimes took him out shooting, if any of the more sporting Pathans of the regiment were not available. Then his ingenuity in getting into the way of the guns was remarkable. When beating grass jungle for black partridge his enthusiasm led him far in advance of the line, and on being shouted at in forcible language, he would come smiling back in the teeth of the guns, of course putting up the only old cock we had seen for half an hour, and causing another volley of expletives.

But it was in snipe-shooting that he excelled. He always managed to get stuck in the slimiest bits of the *jhil* or swamp; and when obliged to jump a ditch, he would give a wild ineffectual spring into the air, which usually landed him in the middle of the water, whence he ungracefully floundered, dripping and muddy, to the inexpressible delight of the Pathans who happened to be with us, and who considered his unsportsmanlike proclivities to be fair game. All this he took in the most perfect good-humour, and he would join in the laugh as he wiped the mud out of his eyes. Owing to these aquatic habits, it was dangerous to entrust to his care either cartridges or lunch. On Christmas Day he produced the haversack full of sandwiches, made extra good in honour of the occasion, in the condition of very muddy trifle, he himself covered from head to foot with the blackest mud. The state of his person he explained by the fact that he had been acting as an amateur diver in quest of the whisky bottle, at the bottom of a deep and slimy ditch into which he had dropped the precious liquid, and without which he knew better than to appear.

The camel which carried my belongings took a most particular dislike to Mana Singh, and made his life miserable by snapping ferociously at him whenever he came within reach while it was being loaded. This dislike on the camel's part was reciprocated by the orderly, combined with the most sincere terror for the animal, and what loading-up he did was very skirmishingly effected from the rear. But when the beast was safely on the road with my tent and bedding on its back, and the cord of bondage in its nostril, then he had his revenge as he walked airily along beside it, digging it in the ribs with his rifle, exhorting it to *chalo*, and generally behaving unkindly to it.

One day, when my bearer was ill, I entrusted to him the operous duty of brewing my morning tea; and after a careful demonstration of the uses of the teapot, &c., I thought he might possibly succeed in preparing that beverage without a blunder. So the next morning, he stumbled into my tent in the dark at *réveille*, and after some mysterious evolutions with rattling cups and spoons, announced that the tea was ready. Then I shiveringly turned out into the freezing air, to find a cup half filled with a mixture of dry tea and sugar, with a teapot of hot water standing beside it. Great was his regret and profuse his promises to do better next time, when I explained to him that although this might be the best method of making tea according to Sikh ideas, yet it did not accord with the inscrutable customs of the Sahib-log.

In cantonments he had a great friend—a brother orderly who lived in the next compound. These two used to vie with each other as to whose house

would be most beautifully decorated with all the scraps of coloured paper and pictures they could lay their hands on. Mana Singh's dwelling was a dark little mud hut about ten feet square, with a narrow low door, in my servant's lines, and of this abode he was as proud as any rajah of his palace. Its walls were covered with advertisement sheets from the *Queen*, pictures from *Punch* and other papers, as often upside down as not, and in the place of honour a big chromo from some Christmas Number. I was often called on to admire when any new work of art was added to this gallery, and sometimes a joint request would be made to me, with much nudging and giggling between the disputants, that I should inspect Amar Singh's house as well, and give an impartial opinion as to which was the most artistic and beautiful. Besides the pictures, Mana Singh's house contained a *charpoy* or bedstead, half a dozen brass cooking vessels, highly polished and shining like gold, and a little mud fireplace in one corner. On the wall hung a diminutive mirror, an article in very frequent use, for our friend was exceedingly vain, and would spend hours sitting in the sun trimming his beard and combing his long hair, which he wore screwed into a knot and fastened on the top of his head with a little comb, in the usual Sikh fashion.

In spite of his stupidity, he had many good points, and I never could find the heart to relegate him to the lines. He was so proud of his position, and seemed to consider the bungalow and all it contained his own especial property, as he walked smilingly about the compound dazzling the eye in his garments and prodigious *pagri* of spotless white and his funny little scarlet waistcoat. Many a laugh we had over him and his ways, and I often wish that my present staid and proper little Goorkha possessed a little of the absurdity of honest Mana Singh.

STOWAWAYS.

A PARTY of us were seated in the smoking-room of the screw steamer *Vancouver* late one evening, engaged in filling the cabin with smoke and diminishing the ship's supply of rye whisky. Incidentally the conversation turned upon a somewhat curious character we had among the usual consignment of stowaways, and Captain S—, who formed one of the party, thereupon proceeded to relate some of his experiences in this connection. The captain was an excellent *raconteur*, and his style was true blue and quite inimitable. I have only retained the gist of his story, and will therefore make no attempt to give it in the language he used.

Hardly an ocean steamer bound for America leaves a port in Great Britain but it has four or five of these unfortunate creatures stowed away somewhere. Many captains make the discovery that they have twenty or even thirty of these undesirable passengers aboard, and that they have as many more mouths to feed. This makes some skippers pretty savage, as when they sail they have stores only proportionate to their crew, with due provisions for delays from stress of weather, will of God, &c.

The stowaways are recruited from all sorts and conditions of men, but as a general rule they are

mostly incapables and the scum of the streets of London and other great cities. It can be truthfully said of them as a class that their leaving their country is usually for their country's good. They hang around the docks until an opportune moment arrives for shipping aboard, and they usually select ships which are taking in a cargo of pipes or bricks or some other material in which they can make a comfortable hiding-place. As a general rule, they are assisted by the 'bumpers' or ship labourers, with whom they are leaguéd, and who, while loading a ship with brick, can easily build it up leaving a square room in a dark corner in which a dozen or two of stowaways can be accommodated with comparative comfort. When the cargo consists of pipes, the stowaways simply creep inside them, and wait patiently until they think the pilot has gone off and the vessel is well away from land. This plan has its little inconveniences, as, directly a ship leaves port, the officers start upon a tour of investigation, and often throw bricks and other material awakens into the pipes. When they hear an appreciative howl, they make the stowaway crawl out. The majority of the men, however, either escape the bricks or bear the slings and arrows of outrageous fortune with Spartan fortitude, because it often happens that after the officers are satisfied that they have escaped this scourge, a dozen or so of stowaways come from below and begin to inhale the ozone in safety.

One officer in a Glasgow steamer, while looking through a consignment of bricks, suddenly discovered a nest in which eight men were seated in contemplative silence with their knees drawn up to their chins. They were all marched up on deck, and immediate preparations made for putting them on shore. Before the boat was lowered, two more came up on deck. These latter had divided their food in portions in order to last them until they were well out from shore; but in the darkness, they had apparently miscalculated the time and eaten too many meals. Their food had run out, and the ship was still in the Firth of Clyde. The whole party was then safely landed on the Cumbræ More, an island which only boasts of one town, and was sufficiently distant from Glasgow to give them considerable trouble to accomplish their return in the destitute condition they were in. The officer of the ship was therefore somewhat surprised, upon arriving at Montreal on his next voyage, to find some of these same men working on the wharfs.

Captains generally endeavour to land their stowaways as far as possible from any settlement, in order to make their ships unpopular with this class of passengers. The sufferings which some of these unfortunates endure under such circumstances are more easy to imagine than describe. They often have to walk a dozen miles or so in bad weather with insufficient clothing and without food or drink, after having passed through the horrors of being cooped up in a ship's hold two or three days.

When a ship is too far out from land to send a boat ashore, the captain is reduced to the necessity of taking all the work he can get out of the men, and he generally does this pretty effectually if there is only a moderate consignment of them. But it is hard for any captain to find work for twenty extra men, and in such a case, the smartest

of them are put to work as deck hands, and the rest are treated as steerage passengers and handed over to the police on arrival.

Captain S— gave a rather ludicrous account of the experiences of a *confrère* some few years ago. His ship was hardly well out on the ocean when two stowaways made their appearance, and later in the day five more. The next morning six more came up; and during the two following days they kept coming up in twos and threes until they numbered twenty-five all told. The ship seemed to be teeming with stowaways, and the officer on watch was fairly bewildered. There was a plaintive pleading in his voice as he said to the last comer, 'Say, hadn't you better send the rest up at once.'—'They are all up now, sir,' replied the stowaway with repressed cheerfulness, and the officer gave a sigh of relief. When the vessel arrived at Quebec, the captain sent a despatch ashore with the pilot-boat to be forwarded to Montreal, asking that a detachment of the harbour police be at hand when the vessel came alongside, to arrest the men. The police were in readiness on the wharf; but the steamer stranded in mid-stream, and lighters had to be sent off to relieve her of part of the cargo. One of the lighters was alongside when darkness came on, and she had to lie-to until sunrise. When the lighter was fully loaded, she drew in to the wharf to discharge; but hardly was she moored, when there was a movement among some sacks, and a stowaway leaped out and made a break for the wharf. Another immediately sprang out from the other side; and in another instant the whole deck of the lighter was alive with stowaways, running up the wharfs and leaping over the obstacles that came in their way. The captain was powerless with amazement, and did nothing but stand and look on in a dazed sort of a way. When the last of them had cleared the vessel's side and things had quieted down a bit, he recovered himself, and walking over to the sacks, he poked carefully about among them, but finding nothing, he resumed his former position. Suddenly, another stowaway, who had been unable to get out with the rest, jumped up and cleared. This was too much, and the captain shouted: 'If there's any more passengers going ashore, they had better go now.' But the whole consignment had escaped free of duty.

AFTER HARVEST.

THE harvest now is over, and the sheaves
Lie dusky-bounden on the granary floor :
Across the breezy meadow-lands no more
The gleaners wander out on golden eves
To gather fallen ears; but forest leaves
Are fiery crimson that were green before,
And squirrels gather in their winter store
Where here and there a breath of Autumn grieves.
Thus as I wander o'er the lonely scene,
And stop to listen for hushed melodies—
(Only the fitful wailing of the breeze
Where birds have carolled 'mid their cloisters green)—
I ask the meadow-lands and forest trees
If they are sad at thought of what has been.

PRICE 1½d.

A SHAKESPEAREAN SHRINE.

It is a far cry from Stratford-on-Avon to Brighthelmstone-on-Sea; and the association of two such opposite places is not at first sight very apparent: the one a comparatively remote, quiet, old-world, midland little town; and the other a modern, noisy, overgrown, fashionable watering-place. Yet, within the last twenty years a link has been forged which has for a time certainly established a distinct relationship between them. For, to the seaboard of the South Downs were conveyed from the valley of the Avon what it is not too much to call the rarest and choicest collection of Shakespearean relics ever brought together, scarcely excepting that at the birthplace.

It is a somewhat old story now; but as its interest is abiding, it may at least claim a reference when the anniversary of the divine poet's birth and death comes round. Moreover, the recent lamented decease of the owner of these rare treasures, Mr J. O. Halliwell-Phillips, adds another reason for reverently and affectionately touching on the subject. It is sufficient to say here that the collection consists of every variety of object—from pictures, engravings, original drawings, portraits, maps, plans, books, manuscripts, rare editions of the plays, down to the minutest items and articles which can have any bearing, or throw any light, on the life and writings of the Great Master. Their authenticity is amply guaranteed by the well-known and recognised position held by Mr Phillips as the most learned authority on Shakespearean lore which the present or, indeed, any generation has known.

An able and appreciative commentator on his work speaks of Mr Phillips' exhaustive book, *The Outlines of the Life of Shakespeare*, as 'a monument of zealous, devoted, intelligent labour;' and he further adds: 'The labour has indeed been one of love, and no pains have been spared to ascertain every fact, to record every tradition, and to trace out every inference which could directly or indirectly increase our knowledge and stir our fancies in connection with the life of the man of

the greatest intellect and the highest imagination that the world has yet seen.'

The relics in the Museum are the direct evidence, the *pièces de conviction*, as it were, which go far to establish our deductions from Shakespearean biography, notwithstanding their 'perplexing suggestions.' Many of them, however, carry us far beyond hypothesis, and prove beyond dispute the validity of 'our minimum of certain knowledge,' as recorded in *The Outlines* and elsewhere. 'Very few authentic personal relics of the great dramatist,' writes Mr Phillips in the preface to his catalogue—'that is to say, "articles" that were at one time indubitably in Shakespeare's own possession, are known to be in existence. They are, in fact, restricted to the will now preserved in Somerset House and to a small number of title-deeds; for there is not a single other domestic memorial of any description the genuineness of which is not open to either doubt or suspicion. But that the title-deeds of his unmortgaged estate, those that are dated previously to the 23d of April 1616, were once in his own hands, does not admit of rational question; documents of this kind having been in his day jealously guarded by their owners, never being entrusted, as now, to the custody of solicitors. Of these title-deeds, there are no fewer than six in the present collection—the four New Place indentures, and the two original indentures of a fine between the poet and Hercules Underhill, that was levied in the year 1602.

To these may, in all probability, though not with absolute certainty, be added the original conveyance of Shakespeare's Blackfriars estate, 1613, which was unquestionably on the table when the poet executed the concurrent mortgage; and as it must have been formally passed over to him, it is altogether most unlikely that he did not touch it with his own hands.'

This extract is sufficient to show the reliability to be placed on the various items, and the determined method adopted to reject everything of questionable authenticity. There is also a copy of the Droeshut portrait, the earliest engraved

likeness of the great dramatist in its original proof state, before it was altered by an inferior hand into the vitiated form in which it has been so long familiar to the public.

But our object is not to give an enumeration of the relics, so much as to remind those who may be interested in such matters, that a pilgrimage to the almost suburban hills behind Brighton, will, in a poetical and antiquarian sense, answer the purpose of a visit to the rural Warwickshire town. We have no concern with the motives which induced Mr Halliwell-Phillips to establish his antiquarian Museum in what would seem to be a locality entirely out of harmony with such possessions; for nothing can be well conceived in greater contrast than is the aspect of Stratford-on-Avon and its surrounding scenery, and that of the villa-bedecked, cockneyfied environs of Babylon-by-the-Sea. At the same time, it must not be thought that the position of the fir-girt pile of buildings known as 'Hollingbury Copse' is entirely devoid of attraction. It lies about a mile and a half along the Ditchling Road as approached from the rear of Brighton; and the steep ascent which has to be made all the way is sufficient to prove that it must command a fine view of Down-land, town and sea. The weather-worn belt of trees enshrouding it is similar to many a 'spinney' here and there to be met with on the face of these wind-swept uplands. The house itself is described as being 'on the plan of a farmhouse at Stratford.' It is erected entirely of wood, cased in galvanised iron, and painted in imitation of the half-timbered style of the Elizabethan period. The rooms being all on the same floor are open to the roof. The corridors leading from one part of the building to another bear Shakespearean names, and are denominated 'lanes;' whilst in and around the house are apt quotations, painted by friends of the owner, and selected from the works of the great dramatist whose genius he worshipped. Although he is now gone from amongst us, it is gratifying to learn from his own statement that the invaluable contents will in all probability be kept together, and allowed to remain beneath the roof he loved so well, and where the last hours of his peaceful well-spent life were passed.

Therefore, for a while at least our suggestion may hold good; and the mere fact that so much of what was associated with the poet has found its *Walhalla* on the rolling Sussex Downs, is sufficient to convert the spot into a sacred shrine. Nay, it might be conceded by all save the hardened sceptic and matter-of-fact scientist, that there is enough and to spare within Hollingbury Copse to warrant the belief that the immortal spirit may at least once a year 'revisit the glimpses of the moon,' and wander from the banks of Avon across the combs and hollows of these southern hills—itsself to hallow by its presence the loving care and reverent regard there bestowed on everything which bears an earthly trace of that stupendous mind.

The worthy Stratford folks willingly acknowledge that on the 23d of April every year the nightingales salute with their first notes the advent of the phantom form. For not until that day, it is said, do the sweet birds deign to make

their presence known by song; but that with its coming, sure as the very date, each copse and brake, and every gray-leaved willow fringing the silver stream, is alive with their woodland melody. Only in this one way will the good burghers of the Warwickshire town account for this coincidence. The gifted songsters recognise their master's presence, and hail it with their own especial joyous strains, desiring mankind at large to share in their delight. This being so, shall we deny a similar privilege to those who dwell upon the southern seaboard? True, there are no nightingales to do the spirit homage, but it would be hard on that account to forbid indulgence in the pretty fancy to those whose lines are cast on a soil of chalk instead of loam. They may at least be allowed to take the cue from the Midlands, and admit that if their Sussex Downs could claim a band of equally melodious choristers, the expenses of the turf-clad knolls would echo equally with this same choral service. A sacred shrine is erected there, and we may be sure that for a brief twenty-four hours annually some glimpses could be caught of the great Immortal in whose honour it was reared, were we but gifted with the far-reaching sight of Philomel, albeit she is not on the spot *in propria persona*, to warble her signal of 'The Presence.'

To give imagination wings wherewith to soar to such a height may not be easy, yet the quaint conceit might justify the effort, remembering how wholesome it is sometimes to let it take its flight, if only to bear us above the sordid cares and meaner ambitions of this workaday world. In such a cause, too, there is every excuse for letting loose the curb on fancy; and if it refuse to carry us to the length of accepting the Stratford tradition about the birds in its integrity, it may at least stir our memories, and induce us not to let the poet's birthday slip by without a passing thought. Any who in the sweet spring-time have sought for some cause the bracing air of the great seaside town, might with advantage, as many do, find a change from the monotony of its long parade by a pilgrimage up to its neighbouring Downs. They do not offer those rural beauties for the nature-loving Rambler in any way resembling those which meet his eye in the valley of the Avon; still, it will not be forgotten that they possess an intrinsic beauty of their own; and albeit the recent efforts to bring portions of their surface into cultivation have destroyed many of their peculiar characteristics, there are yet plenty of these left to render them highly attractive. There is a sufficient abundance still of the short, springy, verdant, thyme-scented turf to make them an unexampled playground for the pedestrian and horseman, whilst the magnificent and far extending prospects either landwards or seawards to be gained from their highest ridges are unrivalled in the south of England.

Only on this Shakespearean point, however, can the 'unshrubb'd down' claim the slightest affinity with the Warwickshire hills; but that may suffice on an emergency to keep our memory green. Earnest students of the bard, as well as those who have but a slight, and yet a conscientiously affectionate acquaintance with his majestic thoughts and noble words, will be inclined henceforth to invest the locality with an interest and a poetry not dreamt of until the establishment of Hollingbury Copse—that quaint wigwam on the

Sussex Downs 'which has the honour of sheltering more record and artistic evidences connected with the personal history of the great dramatist than are to be found in any other of the world's libraries.'

This sentence, extracted from the title-page of the catalogue of rarities compiled by their lamented owner, is followed by another, alas! now, only too significantly applicable to himself, and to all who can reverence and appreciate such labour and devotion as his. Truly must we each individually exclaim:

But now he's gone, and my idolatrous fancy
Must sanctify his relics.

A DEAD RECKONING.

CHAPTER VI.

THE Blue Room into which Mr Tom Starkie had been shown was at the back of the house, and its windows looked into a quaint old-fashioned garden with clipped hedges and shady alleys. In order to reach this room, visitors had to cross the entrance hall, then proceed along a wide corridor which intersected the house, with doors opening on either hand, after which they found themselves in a second hall almost as large as the first. An archway, from which depended a heavy *portière*, divided this hall from the Blue Room. This second hall, which was lighted by a cupola, was hung with a few family portraits, some arms pertaining to various countries and various epochs, together with sundry trophies of the chase.

A broad, shallow, oaken staircase, black with age, led to an upper floor, at the foot of which, on either hand, stood a man in armour with his visor down, grasping in his mailed right hand a lance half as tall again as himself. Tropical plants in tubs were disposed here and there.

Gerald Brooke, pushing aside the *portière*, advanced and shook hands with his visitor. Mrs Brooke and her aunt had remained behind. It was just possible that Mr Starkie might have something of a private nature to communicate to Gerald. 'Brooke, what's this confounded mess you seem to have got yourself into?' he began, without a word of preface. He was a red-haired, open-faced, good-natured-looking young fellow of three or four and twenty. 'Have you heard that Von Rosenberg is dead, and that you are accused of having murdered him?'

'Yes, I have heard,' answered the other quietly. 'Is that the affair about which you have come to see me?'

Mr Starkie looked thunderstruck. 'As if, by Jove! it wasn't enough! But, unfortunately, there's more behind.'

Gerald touched the bell. 'There is no reason why my wife and her aunt should not hear anything you have to say,' he remarked. 'They know already of what I am accused.'

When the ladies came in they shook hands with Mr Starkie. Clara and he had known each other for years.

Gerald having explained the nature of their visitor's errand as far as he knew it, turned to the young man and said: 'And now for your

narrative, dear boy; we won't interrupt you oftener than is absolutely necessary.'

'I'll cut what I've got to say as short as I can,' rejoined the other, 'because, don't you know, there's no time to lose.' He cleared his voice and drew his chair a few inches nearer Gerald. 'About three-quarters of an hour ago,' he began, 'I happened to be with my dad in his office talking over some private matters, when Drumley, our new superintendent of police, was ushered into the room. He horrified both my dad and me by telling us that the Baron von Rosenberg had been found murdered—shot through the heart in the little *châlet* which stands in the grounds about a hundred yards from the house; and he shocked us still more by telling us that he had come to apply to my father, as the nearest J.P., for a warrant authorising the arrest of Mr Gerald Brooke as being the supposed murderer. As soon as my father could command himself, he demanded to know the nature of the evidence which tended to implicate a gentleman like Mr Brooke in a crime so heinous. Then Drumley, to whom every credit is due for the smart way in which he has done what he conceived to be his duty, adduced his evidence item by item. Item the first was the finding of a curious pistol, inlaid with gold and ivory, which was picked up a few yards from the *châlet*. It had been recently discharged, and was recognised by some one at Beaulieu as being, or having been, your property.'

'There can be no dispute on that point,' said Gerald. 'The pistol in question is mine. I lent it to the Baron the last time he was here, ten weeks ago. He wanted it for a certain purpose, and promised to return it in the course of four or five days. As it happened, he was summoned by telegram next day to Berlin, and, as you may or may not know, he only returned to Beaulieu yesterday. Hence the reason why my pistol was still in his possession.'

'How unfortunate!' answered Starkie. 'But perhaps you had some witness, perhaps some one was there at the time who saw you give the pistol to the Baron?'

Gerald considered for a moment. 'No,' he said; 'we were alone—the Baron and I; no one else was in the room when I gave him the pistol. He would not let me send it over by a servant, but persisted in taking it himself.'

'That is more unfortunate still,' said the young man. 'The next item of evidence was that of two of the Baron's men, who deposed to having seen you making your way through the plantation in the direction of Beaulieu; and to having seen you returning by the same way some twenty minutes or half an hour later, and not many minutes after they had heard the sound of a gun or pistol shot.'

'That fact also will admit of no dispute,' answered Gerald. 'I left home with the intention of calling on the Baron on a matter of importance; but at the last moment I changed my mind and determined to write to him instead. I, too, heard a shot; but as the Baron has a range for pistol-practice in his grounds, I thought nothing of it.'

Very glum indeed looked Mr Starkie. 'And now we come to the last item of evidence, which is perhaps the most singular of all. Had you

not, a little while ago, a groom in your service of the name of Pedley?"

'I had. About two months ago, I had occasion to discharge him for insolence and insubordination.'

'And a few days later he came to you for a character, telling you that he had a chance of getting into the employ of the Baron von Rosenberg?'

'He did; and as I thought he was sorry for his behaviour, I gave him a note to the Baron's man, whose name I don't just now remember.'

'The day Pedley came to see you, do you recollect whether you left him alone in the room where the interview between you took place?'

'Now you mention it, I believe I did leave him alone for a couple of minutes while I went into the next room to write the note I had promised him.'

'He seems to be a dangerous sort of customer. According to his account, it would appear that during your absence from the room, observing a half-burnt piece of paper in the fender, he took it up and carefully opened it. He had only just time to glance at its contents before you returned; but what he saw was sufficient to induce him to take the paper away with him so as to enable him to decipher it at his leisure.'

'May I ask the nature of the contents of the paper in question?' said Gerald, who had turned a shade or two paler in spite of himself.

'When Pedley heard that you were suspected, he spoke to Drummley, and came along with him to see my father. There he produced the half-burnt piece of paper, the contents of which he stated to be in your writing, though how he should be able to speak so positively on the point is more than I can understand. Anyhow, Brooke, if the document should prove to be in your handwriting, it seems a somewhat singular composition, to say the least of it. I had only time to glance hurriedly over it; but from what I could make out, it appears to be a sort of warning addressed to Von Rosenberg, telling him that his life is in great and imminent danger, and that he has been condemned to death; and then there was something about escaping while there was yet time; but the whole thing was so fragmentary, and here and there there were such gaps in the sequence of the sentences, that I may perhaps scarcely have gathered the right sense of what I read. As there seemed to be no time to lose, I did not wait to hear more, but had my mare saddled at once, and rode straight across country, taking everything as it came, in order that I might be the first to bring you the news, bad as it is, and so put you on your guard.'

Gerald grasped his hand. 'You are a true friend, Starkie, and I thank you from my heart,' he said. Then he added: 'I trust you will take my word when I say that, however black the evidence may at present seem against me, I am as innocent of this man's death as you are.'

'I believe it, Brooke—with all my heart I believe it!'

'Now for an explanation of the half-burnt letter. That it is in my writing I don't for one moment doubt.' Mr Starkie gave vent to a little whistle under his breath. 'It is perfectly

true that Von Rosenberg's life was in imminent danger. His enemies were powerful and implacable, and nothing short of his death would satisfy them. He was to be assassinated—murdered in cold blood. In what way I came to know all this I am not at liberty to say. The half-burnt paper picked up by Pedley was a letter of warning to the Baron which I never finished, and afterwards, as I thought, burnt to ashes. Von Rosenberg was at Berlin at the time, and I knew that the danger which menaced him lay here, and not there. Finally, I decided not to write to him, but to await his return and seek a personal interview. He reached Beaulieu last night, and this afternoon I made up my mind to call upon him. I had nearly reached the house, when, coward that I was, my heart failed me, and I came back determined that, after all, I would break my news by letter. And now it is too late!'

'But,' exclaimed the other, 'don't you see that what you have just told me, if told in a court of justice, would only serve to make the case seem a hundredfold blacker against you?'

'I can quite understand that,' answered Gerald sadly. 'Nevertheless, the truth is the truth, and nothing can alter it.'

Mr Starkie looked at his watch. 'I have not a moment to lose,' he said. 'The police may arrive at any minute, and it would never do for them to find that my father's son had been here before them and given you the "tip."'

'Oh, Mr Starkie, what would you advise Gerald to do? What a horrible accusation to have brought against him!' exclaimed Clara.

'It is that, and no mistake; but it is scarcely in my province, Mrs Brooke, to advise your husband what to do.'

'Supposing you were in his place, Mr Starkie, what would you do?'

'Upon my word, I hardly know. On the face of it one must admit that the case looks very black against him, so many bits of circumstantial evidence being piled one on the top of another; but I have no doubt in my own mind that further inquiry will in the course of a few hours go far to substantiate his innocence. In fact, I think it most likely that before this time to-morrow the real murderer will have been arrested.'

'Then you would advise?'—She paused, and looked at him with eyes full of entreaty.

'Well, Mrs Brooke, I think—mind you, I only say I think—that if I were in Brooke's place I would make tracks for a little while.—I beg your pardon,' he resumed in some confusion; 'what I mean is, that I would be suddenly called from home on business, or pleasure, or what not, so that when the police arrived I should be *non est*. Only, if you decide to do as I suggest, it must be done without a minute's loss of time. In the course of a day or two, or even earlier, the mystery will no doubt be cleared up, and in the meantime Brooke will escape the unpleasantness of being in quod.—I beg your pardon, Mrs Brooke; I mean in prison.'

'You hear, Gerald—you hear!' cried his wife.

Mr Starkie took Gerald aside and said something to him rapidly in a low voice, to which the other replied by an emphatic shake of his head. 'No—no,' he said; 'I cannot consent to anything of the kind.'

'Well, you know best, of course,' replied Mr Tom; 'but I think I would if I were you. In any case, I'll not fail to be on the lookout; only, don't forget the directions.' Two minutes later he had said his hurried adieus and had ridden rapidly away.

No one spoke till the noise of his horse's hoofs was lost in the distance. A sort of stupor of dismay had settled on the little party. Gerald felt as if he were shut in by a net of steel, which was being slowly drawn round him closer and closer. The mental anguish he had undergone since Karovsky's visit, combined with all the varied and fluctuating emotions of the last few hours, were beginning to tell upon him. It seemed to him as if some hinge in his brain were being gradually loosened—as if the fine line which divides the real from the imaginary and fact from fantasy were in his case being strained to tenuity.

Mrs Brooke was the first to break the silence. She crossed and sat down by her husband and took one of his hands in hers. 'Gerald, dearest, you must fly,' she said with a sob in her voice. The eyes he turned on her caused passionate tears to surge from her heart, but with all her might she forced them back.

'Why should an innocent man fly?' he asked.

'You heard what Mr Starkie said. For a little while it may not be possible for you to prove your innocence, and in the meantime you will escape the ignominy of a jail.'

'But if I do not stay and face this vile charge, all the world will believe me guilty.'

'No one who knows you can possibly believe that.—O Gerald—husband—my dearest and best—listen to me!'

'Clara, you would make a coward of me.'

'Oh, no, no! But consider how strong the evidence is against you. Less than that has brought innocent men to the scaffold before now.'

'Come what may, I must stay and face this out.'

'Again I say no. A few days, perhaps a few hours even, may bring the real criminal to light. As Mr Starkie said, you must go on a little journey—a journey where no one can trace you. For my sake, Gerald—for your wife's sake!'

'Oh, my dear boy, do, pray, listen to her,' put in Miss Primby, who up to the present had scarcely uttered a word.

'To-morrow will prove my innocence.'

'How devoutly I hope so! But can we be sure of it? Days, weeks even, may elapse before the murderer is discovered, and meanwhile what will become of you! Gerald—dear one, think—think!'

'I have thought, Clara. You are asking an impossibility.'

'I am asking you to save your life. You must fly—you must hide, but only for a little while, I trust. You must leave me here to help to hunt down the murderer—to fight for you while you are away.'

'She speaks the truth, Gerald. Oh, do listen to her!' pleaded Miss Primby with quivering lips.

'Again I say, you would persuade me to act like a coward.'

'Let the world call you what it will. While

you are in hiding, your life will be safe. Will it be safe if you stay here?'

Before more could be said, Margery burst without ceremony into the room. 'O mum, they're coming!' she cried; 'the polis is coming! There's five or six of 'em in two gigs.'

'It is too late—we are lost!' cried Clara in anguished accents.

'I ran down to the little hill in the park, 'cos it's getting too dark to see very far,' continued Margery; 'and when I see 'em come round the corner of the road, a quarter of a mile away, I bolted like a hare, and got the old woman at the lodge to lock the gate, and told her not to open it to anybody for her life. It'll take 'em seven or eight minutes longer to drive round by the other gate,' concluded Margery with a burst of witch-like laughter.

'Good girl! brave girl!' ejaculated Miss Primby.

'Then there may yet be time,' said Clara. She dropped on one knee, and clasping one of her husband's hands, pressed it passionately to her lips. 'O Gerald—if you love me—for my sake!' she cried again.

'You are persuading me to this against my will and against my conscience.'

'I am persuading you to save your life, which to me is more than all the world besides.'

'Be it as you wish,' he answered with a sigh. 'I feel as if whatever may happen now cannot greatly matter.'

Clara rose, and as she did so, a strange eager light leapt into her eyes. 'Come with me—quick, quick!' she exclaimed. 'I have thought of a plan. Even now there may be time.' Then turning to Miss Primby: 'You will stay here, aunt, will you not? I shall not be more than a few minutes away.'

The spinster nodded; her heart was too full for speech. Then Clara, passing an arm through her husband's, lifted the *portière*, and they went out together.

Margery had already disappeared.

FERN FREAKS.

IN many respects, the family of Ferns forms one of the most interesting sections of the vegetable kingdom, yet, popularly, remarkably little is known of the special peculiarities by which ferns are distinguished from the hosts of plants with which they are associated, and from many of which, such as palms, cycads, &c., they often differ but little in appearance. The lack of flowers is undoubtedly their chief negative characteristic; but as many plants with conspicuously beautiful foliage bear either insignificant blooms or flower but rarely, this absence does not, strike one as the essential difference which it really constitutes. On consideration, however, it is manifest that in some form or other the equivalents of flowers must exist, or reproduction could not be effected; and obviously the best way to find out what this substitute may be is to seek for something in the fern which is never found in the flowering plant. A careful examination of most adult ferns will result in the discovery of this in the shape of brown, or sometimes olive-green, dots, lines, patches, layers, or clusters of microscopic bodies

at the backs or tips of the fronds. These are the reproductive spores in their receptacles; and a microscopic examination reveals the fact of their existence literally in millions upon every frond, the spore capsules—themselves microscopically small—numbering hundreds, or even thousands, in every patch visible, and yet containing each a considerable number of the, of course, much minuter reproductive spores. In the existence of these spores we find at once a broad line of demarcation between ferns and seed-bearing, that is, flowering plants, not merely in respect of their enormous numbers, but also in the fact that the direct product of these spores is not a fern, but a small green scale (prothallus) like a liverwort, upon the under surface of which eventually the equivalents of flowers are produced, a germ (or germs) is fertilised, and a fern proper appears in due course in the second generation. In the tree ferns, which rival the most majestic palms in size, the spores are as small as in the minutest members of the family, the difference between the spore and its results being thus extreme. A teaspoonful of spores would suffice, indeed, to form a forest of no mean extent.

This, however, is the normal course of fern-life, and is merely introductory to the 'freaks' of which it is our business to treat. As a rule, of course the offspring of ferns, like those of other organisms, resemble their parents so closely as to be generally undistinguishable from them in their specific characters; but it has been found that this is by no means always the case, since here, there, and yonder, on a careful examination of wild plants growing under perfectly natural conditions, very extraordinary departures from the normal forms are found under circumstances which leave no doubt whatever that they have originated with their widely marked peculiarities fully developed, direct from a spore off the surrounding common plants.

To such a wonderful extent has this freakishness been exhibited, that at the present moment, our British species, few as they are, numbering only forty odd in all, have yielded several thousand absolutely distinct forms. It must not be imagined for a moment that these varieties are merely finely drawn differences only appreciable by the eye of an expert; they represent differences in form often far greater than those between separate families altogether, and ranging in a single species so widely, that a long narrow strap at one end of the scale and a round ball of moss at the other constitute the extremes of form assumed. The common Hartstongue (*Scelopendrium vulgare*), for instance, is represented by hundreds of forms, of which the two just cited form the extremes.

The commonest shape in which these 'freaks' appear is quite peculiar to the Fern family, and has no parallel at all amongst the freaks which other plants, and indeed all forms of organic life, display. This peculiarity consists in the terminal points of the fronds and their divisions being more or less forked or divided, in the shape of tassels or crests, which enhance immensely their ornamental character. This splitting-up or tasselling, from a simple forking of the tip of the frond, sometimes extends even to the tertiary divisions, the end of the frond bearing then a heavy tassel, the main side-divi-

sions (pinnae) lighter ones, and the smaller side-divisions of these (pinnules) very minute crests, the *tout ensemble* being very charming indeed. Nearly all our native species have yielded forms of this tasselled character, some of the Lastreas, the Lady Fern (*Athyrium filix-femina*) and the Shield Ferns (*Polystichum*) especially, having yielded scores of different types, in many of which this cresting is associated with other marked and abnormal characters. In numerous instances, the occult influence which induces this tasselling is not confined to the terminal points, but pervades the whole system of the plant; the fronds in these extreme cases commence to split up immediately they begin to unroll, and by continuing this process *ad infinitum*, lose all trace of resemblance to fronds, and form a ball-like mass of finely comminuted vegetation. A Lady Fern (*A. f. f. acrocladon*) of this character was found many years ago on a Yorkshire moor, and has not only remained quite constant, but has yielded numerous offspring, in which this branching 'freak' is even more strongly developed than in the parents.

Another form of variation which has been found in several of the species is an excessive development of the leafy portion of the frond, resulting in the case of the Hartstongue in the transformation of a plain, flat, narrow, strap-like frond into a broad, deep, double frill, with, in some cases, beautifully cut edges. The Welsh Polypody (*Polypodium vulg. cambricum*) is the same sport from the common polypody, the simple once divided frond being transformed altogether by the redundant growth of its parts. This form of 'freak' is usually accompanied by partial or entire barrenness, and is supposed to be an analogous phenomenon to the doubling of flowers, which is accompanied by a similar lack of fertility.

Besides these two forms of variation, which belong to the symmetrical class, and which may be conjoined in one and the same plant, there are innumerable others to which the term 'freak' is even more applicable. In the Hartstongue family, for instance, there are several forms in which the leafy part abruptly terminates an inch or so up the stem, and there forms a sort of pouch or pocket, the midrib continuing for another inch in the shape of a thorn. Odd as this form is, it is an absolutely constant one, the offspring only varying in minor details. Possibly, however, the most extraordinary freak yet discovered is displayed in one of the Lady Ferns (*A. f. f. Victorice*), found wild by the roadside some thirty years ago on the Duke of Montrose's estate in Scotland. This plant has all the divisions, both primary and secondary, in duplicate, and sets on at about right angles to each other, so that a series of crosses is formed along the midribs of the pinnae and pinnules. The pinnae are also very slender, and, like the tip of the frond itself, are terminated by beautifully elongated tassels, of which the slender strands are again tufted. As the fronds and all their divisions display this slender character, a pendent habit is induced, which renders the plant a very charming one indeed. The offspring of this display the same characters, but are usually coarser in make.

Another form of freakishness arises apparently from a constitutional struggle in the plants against the abnormal element within them, the result

being all shades of inconstancy. Extremely marked forms of the most thoroughly symmetrical character have sometimes reverted entirely and permanently to the normal form, the mere act of removal sufficing to obliterate the eccentricity. Others under cultivation do this for a time only, resuming their abnormal character when again established. Numerous good forms of the Polystichum tribe, though otherwise constant and producing characteristic offspring through their spores, revert, immediately they are allowed to get out of condition. Others have a habit of reverting piecemeal, throwing sometimes fronds of both kinds; or it may be that a single frond bears intermingled pinnae, or even pinnules, of two characters. *Polypodium vulg.* var. *Cornubiense* is a constant example of this peculiar form of inconstancy, throwing, indeed, three sorts of fronds—some absolutely normal, some even triply divided, and some of an intermediate character; the normal fronds furthermore frequently bearing isolated pinnae or pinnules of both the other forms. The creeping root of this variety also occasionally runs out and reverts altogether to the normal. In the higher plants, freaks of this sort are usually associated with hybridisation; but that is not the case here.

Space-limits preclude us in this article from enlarging upon this capacity of sporting; but as within the last twelve months the collection at Kew has been immensely enriched by gifts and bequests representing many hundreds of the finest forms, a visit thither is recommended to those who care to investigate the subject more thoroughly. We must not, however, dismiss this portion of our article without reference to a form of freak which would otherwise escape attention—namely, freaks in the method of reproduction. Quite recently, it has been discovered that one form of Lady Fern (*A. f. flavissima*) and two forms of Shield Fern (*P. ang. pulcherrimum* Padley and Wills) have acquired the faculty of forming the small green scale (prothallus) aforesaid upon the fronds themselves without the agency of the spore, the offspring then resulting in the usual way, if the fronds are pegged down. In the lady fern these bodies are produced upon the frond-backs on the usual site of the spore-heaps, the spore-cases themselves, according to Professor F. O. Bower, who has thoroughly investigated the matter, being transformed into prothalli. In the case of the two shield ferns, however, the case is even stronger, the extreme tips of the frond divisions running out into prothalli suspended at the ends of short threads, and being thus produced altogether independently even of the spore-heaps. This phenomenon, termed apospory, constitutes the latest discovery in the sphere of reproductive freaks.

In the vast majority of cases these varieties are found quite solitary in their peculiarities, a single plant appearing amid the mass of normal ones surrounding it, no intermediate types being discoverable. Occasionally, however, large numbers are associated together in a limited area, owing either to the original sport having multiplied itself, or, it may be, through a number of affected spores having been originally shed from the normal parent. Thus the writer found, some years ago, a wall on Dartmoor covered for many feet with a peculiar long-tailed form

of *Asplenium adiantum nigrum*, characterised also by short yellow lobes (*A. a. n. caudifolium*). In this case there were some hundreds of plants thickly clustered together, and actually ousting the normal form which covered the rest of the wall. As an example of the converse kind may be cited a recent find on the side of a stream on the same moor of a finely crested form of *Lastrea montana*, which had no fewer than thirty-three crowns all adherent to one root-stock, the fronds numbering considerably over two hundred, and measuring over a yard long. Manifestly, this plant must have stood there for many years shedding its myriads of spores time after time; yet amongst the thousands of seedlings around it not one of its offspring could be found.

The British Isles, judging from the immense number of sports which have been found wild, as compared with exotic forms of like character, would appear to be especially favoured in this respect; but a glance at the map of the world on the one hand and a full list of exotic species on the other leads to the inevitable assumption that the comparative paucity of exotic varieties is solely or mainly due to the greater attention the variation of these plants has received in this country. Here, as we have said, there are only some forty odd indigenous species; while between three and four thousand exotic species are recorded. Amongst these exotics, especially in the Maidenhair (*Adiantum*) families, numerous very marked varieties, tasselled, congested, plumose, &c., have originated under cultivation, *Adiantum Farleyense*, a reputed sport from *A. tenerum*, occupying first rank among them. In the Azores, several very beautiful tasselled forms—among these *Woodwardia radicans cristata*—were found by one man, Mr Brown, who evidently had an eye for varieties as well as for species, a distinction which implies a decided difference, and which probably is the key to the puzzle.

The search for varieties and for species differs in this respect, that where a species grows in profusion, a general glance of the botanical eye suffices to satisfy the mind that no new species is there. But the variety-hunter must go farther, and examine each individual, since in many cases a new find is only distinguishable among the host of its fellows by a small portion being visible, the abnormal nature of which it is the province of the variety-hunter to 'spot' at a glance. In the case cited of the *L. montana*, the species required no second glance even at a distance of twenty yards; but the eye on the lookout for tassels was needed to 'spot' an indication of those at that distance.

To our mind, there is absolutely no reason why even the majestic tree ferns should not be subject to similar influences as their humbler brethren, and we may reasonably anticipate that in time our conservatories may be graced by lovely tasselled forms of these so soon as a persistent variety-hunter turns his attention in their direction, or some species-hunter in a favoured locality catches the 'fever' of variety-hunting, which is often induced in amateurs by the accidental discovery of a good thing.

Considering the undoubtedly greater beauty of many of these 'freaks' as compared with the normal forms from which they spring, it is a great pity that they are not better known. In

hundreds of gardens, so-called ferneries are found on examination to contain nothing but some three or four common species repeated *ad nauseam*, while the same space devoted to a collection of the choice forms would be a hundred times more interesting and beautiful. Among the 'freaks' in most of the families are beautiful dwarf forms, in which reduction of size is accompanied by the other attributes of tasselling, congestion, &c. Here is a field for the ladies, who, in the limited space of a single north window, could have a pet collection of veritable gems of verdure demanding a minimum of attention, and affording a maximum of pleasure under circumstances where flowers would perish for lack of sun. In fine, this capacity of growing in the shade (not in the dark, remember, for the more light the better, barring direct sunshine), coupled with the great range of form with which Nature has endowed them, affords the dwellers in cities and towns an opportunity of study and pleasure which at present is practically ignored, but which only needs to be made known to be appreciated and utilised.

A TERROR TO EVIL-DOERS.

By CATHERINE G. FURLEY.

IN TWO CHAPTERS.—CHAPTER I.

THE town of Picton stands on the high-road between Melbourne and the gold-fields of Victoria. It is now the centre of a large pastoral district, with railway communication with the capital, and a growing population that divides itself into castes in the orthodox old-country style.

But twenty years ago it was a small place, important chiefly because it was the only township within thirty miles, and because inside its walls—such as they were—all the organisation of civilisation was concentrated. There were churches in Picton—an Episcopal church and a Baptist chapel; there was a store and a court-house; and a doctor had lately set up in practice. Being an energetic young fellow, who believed that skill and earnestness are worth as much in a new country as capital is in an old one, he was doing well; though his patients paid their fees in gold-dust and sheep and grain as often as in coin of the realm. Yet he was not a happy man this mild March day, as he stood in the veranda of the vicarage, looking with irritated admiration at a girl whose yellow dress and tawny brown hair and eyes harmonised with the brilliant autumn tints of the creepers that twined around the posts and hung in long trails from the roof.

Madge Renton, the vicar's daughter, was not the belle of Picton; that pre-eminence was claimed by Jenny Birch, the innkeeper's only child, who had golden hair, and a pink and white complexion, and three times as many new gowns as Miss Renton. But tastes differ, and though the miners from up the country and the occasional travellers who for any reason, or none, stopped at Picton, all admired Miss Birch, Dr Philip Sewell did not think her worth looking at when Madge was by. He would have been well content to

have had this eccentric taste all to himself; but, unfortunately, it was shared by another member of the small community, and that the most important one in it. The Law by common consent ranks above Medicine in our social organisation—the newspaper which spoke of 'the value of life and the sacredness of property' only echoed the public sentiment which has fixed the respective status of the professions—and though the Church is supposed to rank above either, it is to be feared that the lawyer, above all when he is magistrate as well, bulks more largely in popular esteem than the parson. At least that was the case in Picton, where Captain Frere, the 'police magistrate,' was decidedly the greatest man in the place.

He had been in the army before he came to Australia, and had been invalided after the Crimean War, which at once made him something of a hero. He was, moreover, a distant cousin of a peer who had once been Governor of Victoria; and it was to this connection that he owed his present appointment, given him when his health seemed so shattered as to make active service impossible. The Australian climate had restored him to strength, and, if one might judge from expression as well as looks, to more hope and energy than he had seemed capable of when he came to Picton, two years before the day when Dr Sewell—a later arrival still—lost his temper with Madge Renton after having already lost his heart to her.

The girl sat rocking herself in a light cane-chair, as if trying by the motion to keep some inward vexation from finding vent in words. A faint flush stained her usually pale cheeks, and her tawny eyes looked darker with anger. Miss Jenny Birch, who had been known to describe Madge as 'a red-haired, white-faced thing,' had never seen her look so beautiful; for it was Miss Renton's wont to go about the world rather coldly, except when love or pity or anger roused her soul and her features to some excitement.

There was considerable excuse for the indignation she was now showing. Dr Sewell had the habit of candour, and he had been indulging in it to the full, under circumstances when reticence would have been especially advisable. He had just asked Miss Renton to marry him; and his request being refused, he had demanded the reason of her negative reply, and begged her to reconsider it. At first Madge had merely reiterated her assurance that she could never accept him; but she liked him just well enough to hate wounding him, and in order that she might not seem to be doing so without cause, she at last explained that she was engaged—privately, not even her father knew of it—to Captain Lewis Frere. At this point the rejected suitor's duty was clearly to bow to the hand of destiny and retire from the contest with as much dignity as he could muster.

This, which he ought to have done, was exactly what Philip did not do. He looked agast, shocked, indignant, and ejaculated almost unconsciously: 'Engaged to that old—fogey!'

Madge felt certain that a harsher word than fogey was in his mind, though he managed to restrain it; and fogey was bad enough. A girl who is thoroughly in love with a man considerably her senior can laugh at the surprise of her

friends; but when she is not quite sure that he is the one man in the world for her, when she has been carried away by the novelty of wooing, and by the knowledge that a man who has been all round the world and has tried all life's flavours for five-and-forty years, seeks as the best gift it can give him her untutored self—when vanity has dictated her acceptance more than love, she is apt to resent very deeply any insinuation that, after all, her prize is not so very well worth winning. She must prove that it is a pearl of price; she requires to convince herself of it as much as any one else; and she is very indignant when another gives utterance to the doubt that has been lurking, half-suspected, in her own mind.

Fogey, indeed! How dare Philip Sewell hint at such a word! It is true that Lewis was a little bald, and had a few crow's-feet about the eyes, and that there were white streaks in that beautiful beard of his. She was sure Philip would have been only too proud if he had had a beard as long and flowing, instead of a miserable little moustache. Still, she would make Lewis shave it off; it certainly did make him look older, and there was no need to do that. But he wasn't a fogey!

'You are very courteous!' she exclaimed in tones that made Philip feel how lacking in courtesy he had been.

'I beg your pardon, Miss Renton; I had no right to speak as I did; but—but you know'.

'O yes, I know! I know that boys of four or five and twenty' (Philip was twenty-six, and this was as near it as she dared venture) 'always try to disparage men who have reached the age of wisdom. They are jealous of them, I suppose.'

'No, they're not,' said Philip bluntly; 'except—that is—except when—when'.

'Pray, don't make exceptions out of consideration for me. I am quite prepared to admit that very young men don't appreciate the qualities of those who have more experience than themselves; but women, fortunately, are different,' said Miss Madge, who had just passed her nineteenth birthday, with a grand air.

'I hope they are! That is, I hope you are in love with this fellow Frere, though I don't see how you can be. And I don't believe you are.'

'Dr Sewell, how dare you speak in such a fashion!'

'I beg your pardon; I am very stupid. I know I have no right to criticise your choice. I am mad—jealous, I suppose. But when a man has his best hope taken away from him, he'—The words ceased, a certain husky feeling that had been in Philip's throat since the moment Madge said 'No' having suddenly become so marked as to prevent articulation.

The girl grew softer when she saw how moved he was. 'I am very sorry, Philip, very sorry,' she said gently; 'but you see I am not free, and you will find somebody else who will suit you better.'

'Never!' he exclaimed stoutly. 'Even a boy may know his own mind, when he is a boy of twenty-six, and I know that I shall never love any one but you.'

She was about to combat this opinion, which would probably have resulted in a new develop-

ment of the original quarrel between them, when her father appeared. The Rev. Mr Renton was an anxious-looking man, who seemed to feel how little his Oxford training was adapted to his Australian environment. He had come to the antipodes first because his health was weak; and when the pure soft air had healed his feeble lungs, he began to look for some sphere of work in the new land. It was in the purest missionary spirit that he had come to Picton ten years before; and it was in a missionary spirit sublimed to a forlorn-hope that he clung to his post in spite of the bitter consciousness of failure. A few, the more aristocratic portion of the Picton community, came to his church; but the majority of those who cared for religious exercises at all went to the chapel. This consciousness of failure in his life-work gave the parson an apologetic air, even before those who, like Dr Sewell, were loyal members of his flock. Philip did not indeed see that Mr Renton was nervous in his presence; but he perceived, and confided to himself—having no other confidant whom he could trust with a disparaging judgment of Miss Renton's father—that the vicar almost cringed to Captain Frere; and at this moment he glared at his inoffending pastor, being suddenly struck with the idea that he had forced his daughter to accept the captain.
